## THE IDEAL CONVEYOR BELT

Is the one that will carry stone, ore, coal, wet or dry material, holding buckets firmly and securely; will stand all kinds of exposure, and resist the heaviest strains during a long period of service. This is what the LEVIATHAN BELT has done, and we quote the following from a letter from the New York Steam Co.

"We have used Leviathan Belting for four years, up to 34-inch by 8-ply, elevating and conveying coal. Some of the Belting is outside, exposed to freezing weather; some in a steam bath. In both conditions the results have been very gratifying, over 500 tons having been handled in ten hours time."

## W. & P. CYANIDE PAINT.

THE VERY HIGHEST GRADE OF PAINT OR COATING FOR  
Cyanide and Chlorination Tanks and Vats,  
FLOORS, SINKS AND TRAYS,

Or wherever acids, alkalis or water are used. Excellent also for REFRIGERATORS, being odorless when dry. It is a pure asphalt paint, and therefore unaffected by acids or alkalis. Dries very rapidly to an extent sufficient for handling or for application of second coat, but its full hardness is not attained for some hours as drying is retarded by use of a heavy oil, and durability of coat is thus greatly increased. When dry is very tough and not brittle like most asphalt coatings. No carbon bisulphid, ether or other poisonous ingredients are used in its preparation, and as it gives out no noxious fumes or gases it can be used in perfect safety in confined places. For purposes given this paint is the equal of any other paint made, no matter if sold at double the price.

In Barrels - - - 60 Cents per Gallon;  
In Cases, - - - 65 Cents per Gallon.

Can be ordered through the trade. Insist on your dealer getting W. & P. CYANIDE PAINT for you or write us direct.

**SIX YEARS' CONSTANT WEAR WITHOUT A BREAK.**

**1700 BELTS IN USE.**

## THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

JAS. S. BROWNELL, San Francisco, Cal.--DEAR SIR:

We have been using your "Patent Lip" flange belt on our "Triumph" Concentrators since May, 1895, and find that they have given better wear than any other belt made. Also the twelve 6-foot Frues with "Patent Lip" flange belts, lately put in here, are giving us every satisfaction.

Yours truly,

THE EMPIRE MINES,  
GRASS VALLEY, NEVADA CO., CAL., Jan. 23, 1901.

G. W. STARR, Managing Director.

JAS. S. BROWNELL, San Francisco, Cal.--DEAR SIR:

The eight "Patent Lip" flange belts purchased from you in December, 1895, have been in constant use in the mill since that time, and have given the best of satisfaction, and have proved to be far superior to the old plain flange belt which we were using. The belts now in use show hardly any wear, and seem to be in as good condition as when first put on the machines; one thing, they do not show any tendency to crack along the edge of the belt.

Yours truly,

PIONEER-LYNN MINING COMPANY,  
TOWLE, PLACER CO., CAL., Jan. 12, 1901.

JERRY SULLIVAN, Superintendent.

## Gold Mines in the Philippines.

From Washington comes a semi-official report in the shape of declarations made by army officers who have lately returned from the Philippines that, on the island of Mindanao, there are evidences of extended and rich placer deposits. The river Sita and its tributaries in the northern part of the island are said to be the region of the deposits and the gold obtained by the natives the basis of the statements of richness. American miners, it is stated, have not yet gone into the district, the Taft Commission governing the islands having no authority to issue permits or franchises.

Regarding this, it may be assumed that the trifle of lack of a permit is not holding back American miners if there are any in the Philippines that know of the existence of such placers as described. American miners have never been known anywhere in United States territory to wait for permits before working placers. If the reports are true there is placer ground enough for all the American miners now in the Philippines. Those who are there are western miners who have a rough and ready way of adjudicating rights without the costs and delays of court proceedings, so that the Taft Commission would never officially know of the mining. It may be assumed too that, while the Taft Commission has no authority to issue permits to mines, it has on the other hand no authority under which it can stop the mining on public land, or by American miners on lands bought from the natives who have title.

On the whole, the governmental condition described is distinctly favorable to the natural development of mining in the Philippines, and it is, if any-

thing, to be hoped that Congress will not be in any hurry to make mining laws for these islands. It would be better for Congress to send out a Commission to report on what the American miners are doing without any mining laws. Such an investigation

reporting conditions as they are would make their substantial recognition imperative in any subsequent legislation. The miners by that time would have the mines and the mining laws would only have to take into account the requirements under which the vested rights of appropriation could be changed into fee titles for the benefit of capital following the first exploitation by working miners.

Congress should move slowly in mining legislation for the Philippines. The conditions created at Nome as a result of ill-considered legislation should be an example of the effect of misfit legislation, which always proves worse than no legislation at all. California and the West generally got along very much better in mining during the first twenty years of its history before it had anything but the elastic miners' laws and customs than it has since under statutes, the meaning of the wording of which is still disputable and disputed.

Concerning the value of this report as to the richness of the placers, while largely circumstantial, it is not unreasonable that it should prove in substance true. The Philippine natives are not workers, and their work is limited by provision for a very short visual range of subsequent necessities to be satisfied. If Philippine miners get from 50 cents to \$3 gold a day with the pan or its equivalent, the placers will prove rich to American miners with even the simplest methods they employ. It seems fairly clear that the quantity of gold to be recovered in relation to the waste it must be separated from is large.

## California Miners' Association.

The tenth annual meeting of the California Miners' Association convened at Golden Gate Hall in San Francisco on the 21st inst. The number of accredited delegates exceeded that of any of the preceding conventions by forty.

The following county miners' associations and other organizations were represented by delegates as follows:

Nevada 170, Shasta 90, Placer 80, San Francisco 70, Calaveras 43, Amador 34, Butte 20, Alameda 20, Sierra 24, Yuba 14, Tuolumne 5, Plumas 5, Santa Clara 5, Kern 5, San Bernardino 5, Inyo 5, Fresno 5, Mariposa 5, Solano 5, Marin 5, San Luis Obispo 4, Southern California Branch 5, Southwest Miners' Association 5, Chamber of Commerce of San Francisco 5, Chamber of Commerce of Sacramento 5, California Petroleum Miners' Association 10, Pacific Coast Petroleum Miners' Association 5, California State Mining Bureau 5.

Governor Gage of California delivered an address and was followed by Mayor Phelan of San Francisco, who delivered an address welcoming the delegates to the city. In the course of his address he said:

Robert Louis Stevenson has described San Francisco as the smelting pot of the nation. We have accepted that description as most fitting.

You are here for business. One of the features which you are to discuss is the creation of a Department of Mining, under a cabinet minister, at Washington. It is proper that the mountains should be looked after by the Government. This new department would be of untold value to the State of California.

During the civil war the gold of California furnished the sinews of war to the United States Government, the means of preserving the national credit. Therefore the Government owes a sentimental debt to the State. As a mere matter of national policy it is necessary for the Government to preserve the mining interests of the country.

The following were announced as the Committee on Credentials: W. H. McClintock, Tuolumne county; C. H. Weatherwax, El Dorado county; S. J. Hendy, San Francisco; W. F. Englebright, Nevada county; A. G. Meyers, Siskiyou county; William Nicholls, Placer county; A. H. Ward, Mariposa county; J. M. Gleaves, California Petroleum Miners' Association; A. Ekman, Butte county; J. F. Parks, Amador county; A. R. Briggs, Fresno county; W. C. Ralston, Calaveras county; Joseph Durfee, Yuba county; A. W. Bishop, Alameda county; M. E. Dittmar, Shasta county; Frank R. Wehe, Sierra county; L. E. Aubury, Southwest Miners' Association; A. G. Lightner, Kern county; H. Z. Osborne, southern California.

As the meeting was about to take the noon adjournment, Delegate Lafa Pence called the attention of the convention to the option at \$25,000 held by the Debris Commission on the land of James O'Brien on Yuba river, and other options, requiring small sums, for parts of the necessary site for the restraining dam. It was a question, he stated, whether the options expired October 21st or 22nd, but to be on the safe side, he moved that a committee be ap-

pointed to solicit the necessary money to take up the options at once. After discussion, the motion carried. James O'Brien was called to the floor for a statement. He said that his objections to the dam were well known. He refused to extend the option for a few days, and on his refusal the committee, consisting of W. C. Ralston, A. Caminetti and Lafa Pence, was appointed and acted immediately.

On reassembling after the noon adjournment, President Voorhies announced that the committee reported that the money was raised. The donations to the fund totaled \$3150. The contributors were: North Bloomfield M. Co., \$500; California Powder Works, \$500; Eureka Lake M. & Water Co., \$250; Joshua Hendy Machine Works, \$100; Calaveras M., Water & Power Co., \$100; Miller, Sloss & Scott, \$200; Dunham, Carrigan & Hayden, \$200; Baker & Hamilton, \$200; Harron, Rickard & McCone, \$100; Henshaw, Bulkey & Co., \$100; John Roebing's Sons Co., \$100; MINING AND SCIENTIFIC PRESS, \$100; W. W. Montague & Co., \$100; A. Caminetti, \$100; William Nichols Jr., \$100; F. R. Wehe, \$100; J. M. Gleaves, \$100; W. C. Ralston, \$100; George Stone, \$100.

In the short time at the committee's disposal they were unable to see all who wished to contribute, and the amount necessary was so promptly furnished by those first seen that offers of contributions from San Francisco business houses and miners of double the sum collected were unavoidably declined, not being needed. The response to the subscription asked was prompt and generous, and equally creditable to those who missed the chance to contribute with those who contributed.

President Voorhies read his annual address, saying in part:

Gentlemen of the California Miners' Association: Ten years ago a number of hydraulic miners met in the city of Auburn, Placer county, to see if some means could not be devised whereby hydraulic mining might be resumed without material injury to the farming lands and navigable rivers of the State. The outgrowth of that meeting was the organization of the California Miners' Association, and this meeting to-day is the tenth annual convocation.

It is estimated that more than \$300,000,000 in gold is locked up in the gravel hills of Placer, Nevada and Sierra counties which could be liberated and put into circulation if some means could be devised to prevent injury to the adjacent lands.

The first step taken to aid the miners was by the State Legislature in making an appropriation of \$250,000, and the National Congress appropriated a like sum for the construction of barriers to restrain the debris already in the ravines and channels which feed navigable rivers, and also to permit the resumption of hydraulic mining under certain restrictions. The Federal engineers comprising the California Debris Commission made estimates of the cost of the work to be \$800,000. Our representatives in the State Legislature secured a further appropriation of \$150,000, and the National Government will undoubtedly appropriate a like sum—in all, \$800,000, to build barriers according to the plans of the Federal engineers, and preliminary work is now being done, such as securing the necessary land for the restraining barriers; but the engineers are having some difficulty in securing the land they deem necessary for that purpose. We trust, however, they may be able to overcome these difficulties and soon start the actual work of construction.

This Association has done everything in its power to aid in the passage of the so-called "Mineral Lands bill," which was before the last Congress, and received favorable reports from the committees; but, we are told, owing to lack of time, it died on the files, and will have to be re-introduced when the new Congress meets next December.

At our last annual session the Petroleum Miners' Association joined us in our deliberations, and have worked harmoniously with us during the past year for the passage of such laws as would be beneficial for that industry, which is now assuming great magnitude in this State, and is adding to its wealth.

The mineral productions of the United States are growing so very rapidly that the annual value is estimated at more than \$1,000,000,000. It is right and proper that the mining industry of the United States should have of the Government more protection and assistance, which could be better facilitated through a Cabinet department of the executive branch of the Government, and if those engaged in the different branches of mining throughout the United States will join hands and ask for the establishment of a Cabinet officer of Mines and Mining, we certainly ought to be successful in obtaining it.

I would suggest that a committee be appointed to revise the by-laws of the Association so that every member who contributed his annual dues to carry on this work could feel that he had a perfect right to come to San Francisco and participate in the work of the annual convention. The State membership of the Association is about 9000; the annual number of delegates elected to attend the State convention is about 500. I think the influence of a State meeting of 1000 or 2000 members would be far greater than a meeting of 400 or 500 chosen delegates.

During the year three meetings of the executive committee were held, at which business in relation to the additional appropriation was transacted. At the meeting held September 14, 1901, Mr. Power of Placer, Mr. Christy of Alameda and Mr. Davis of Amador were appointed a special committee to draft resolutions of respect on the death of our late President, William McKinley, and to report the same to the convention. I would recommend that we have these resolutions printed on a mourning page of our proceedings.

The increased demand made upon the State Mining Bureau, owing to the increase in the mineral production of the State, necessitates more liberal appropriations for its support and maintenance, and I would recommend that some action be taken toward the recommendation

of the passage of a law that would give it a permanent income to carry on the work of the bureau.

I wish to congratulate all of the officers and committeemen of the Association for the prompt and efficient manner in which they have attended to all their duties, and especially the secretary, who has all of the work to perform during the year. The members of the executive committee have been prompt, and nearly all attended the meetings of the committee.

The Association owes much to the press of San Francisco and throughout the entire State for the courtesies that have at all times been shown to the Association, also to the business men of San Francisco, who have always responded liberally when asked for financial aid to carry on the work.

The Union League Club of San Francisco is deserving of the thanks of the Association for its kindness in giving the executive committee the use of its rooms for committee meetings.

The Committee on Resolutions was appointed, as follows: W. C. Ralston, chairman; W. F. Englebright, Nevada county; E. A. Belcher, San Francisco; J. H. Tibbets, Shasta; W. A. Pritchard, Amador; Jacob H. Neff, Placer; Frank R. Wehe, Sierra; A. W. Bishop, Alameda; H. E. Pickett, El Dorado; A. Ekman, Butte; Joseph Durfee, Yuba; W. H. McClintock, Tuolumne; S. S. Taylor, Plumas; Thomas Derby, Santa Clara; A. G. Lightner, Kern; Frank Monaghan, San Bernardino; A. R. Briggs, Fresno; A. C. Holly, Solano; James Irving, Los Angeles Chamber of Commerce; Victor H. Woods, San Luis Obispo; John F. Boyd, Marin; A. G. Myers, Siskiyou; A. H. Ward, Mariposa; J. J. Gunn, Inyo; J. H. Harrington, Santa Barbara; L. E. Aubury, Southern California; H. Z. Osborne, Southwest Miners' Association; J. M. Gleaves, California Petroleum Mining Association; R. H. Herron, Los Angeles Chamber of Commerce; J. F. Parks, State Mining Bureau; A. C. Hinckson, Sacramento Chamber of Commerce; Thos. Ricord, San Francisco Chamber of Commerce; Craigie Sharp, State Board of Trade; John McMurry, Trinity; William Thomas, California Water & Forest Association; Colonel Heuer, California Debris Commission; J. S. McBride, Nevada.

Congressman L. N. Wood addressed the convention. Speaking briefly, he urged the importance of keeping one man in Congress who was strongly backed by his State and would be listened to seriously.

Lieutenant-Governor Neff, in the course of a short speech, said he knew nothing more important to the State than the impounding of debris and the resumption of hydraulic mining. He declared there should be a secretary of mining in the Cabinet.

President Jordan of Stanford University addressed the convention and explained the practical advantages of the college-trained miner. "It is no longer the man who starts at the bottom and works up," he said. "It is the man who starts at the top and works down."

Professor Christy of the University of California described his recent visits to the great mining schools of Europe and the East, and said that, thanks to the generosity of Mrs. Hearst, the State University would soon have a school of this character which would be a monument not only to Mrs. Hearst and the late Senator Hearst, but to the highest development of scientific mining in the twentieth century.

Judge Adams of El Dorado introduced a resolution relating to mineral lands, which was referred to the Committee on Resolutions.

On assembling on the morning of the second day, the 22nd inst., the report of the Committee on Mineral Lands was made by Chas. G. Yale, chairman. It was reported by the committee that little progress had been made in obtaining Government aid during the past year. The legislation which has been before Congress for seven years is now in no better shape, according to the committee, than it was a year ago. In this connection the committee said:

The legislation proposed by this Association does not design to take anything from the railroad companies which ever belonged to them. By it the companies would lose nothing, by reason of the fact that under the terms of their grants for every acre declared mineral they are entitled to another within the indemnity limits of their grants. But the California mineral lands are yearly becoming more valuable as the variety of our mineral products becomes recognized and more substances are commercially utilized. At one time and for many years our mineral products were mainly gold, silver and quicksilver. Now some forty-five substances are mined, quarried or otherwise obtained, and the number increases yearly, as well as the value of the total product. For the past eight years the value of the mineral product of California has advanced over \$2,000,000 each year, until it has now reached over \$32,000,000 annually. By reason of copper and oil developments alone, to speak nothing of the work in gold and other substances, the next four or five years should see a gradual increase of from \$3,000,000 to \$5,000,000, instead of \$2,000,000, each year.

Gradually, year by year, the domain opened to the prospector within the borders of our State has been narrowed. In his wanderings, he runs against ranches, farms, orchards, etc., the land of which is not for him, though surrounded by active mines. And, worst of all, are the great tracts of land held under railroad grants, extending from the deserts to the snows, and hundreds of thousands of acres in extent. The more land patented to them unclassified, the less of public domain is there for the prospector. Now, in asking what we do from Congress we are endeavoring to restore to the prospector what rightfully belongs to him and is wrongfully withheld. We know that by the provisions of the law estab-

lishing Federal grants to prospective railroad companies, the mineral lands were exempted therefrom and did not pass to the companies. The prospector knows this also, but is powerless to regain his rights, and it is our duty, as allied representatives of the mining industry, to regain them for him, and do it as promptly as may be. Good, active missionary work on the part of all the individual members of this Association is necessary to this matter. The mere passing of resolutions or memorials or appointment of committees, and letting the matter rest there, is of little effect, as experience has shown. Nor is there much effect in appointing a special committee, the members of which reside at different points in the State, and therefore seldom meet. The real, practical work is done in Washington, for from there must come relief, and from nowhere else.

The committee report was unanimously adopted and ordered transmitted to Congress by the Association.

The special committee on resolutions upon the death of President McKinley reported through Prof. S. B. Christy of the State University as follows:

Whereas, William McKinley, selected by the people, from the people, to be President of the United States, while extending the right hand of fellowship to the representatives of the American people, after a long career spent in the service of his country, has been stricken down by the coward hand of anarchy; therefore be it

Resolved, By the California State Miners' Association, that we mourn in William McKinley the type of American citizen that we all honor, the brave soldier, the tender and devoted husband, the generous and loyal friend, the public spirited citizen, the wise statesman. His broad sympathies with every section of our great country, his long and useful public life, his tragic end, his generous kindness and sublime faith in the face of death have made us forget differences of parties and creeds, and we stand by his grave united in our common loss; be it further

Resolved, That we wish to express with the entire civilized world our abhorrence of government by assassination as foreign to the spirit of our civilization, and as the mortal foe of all that makes for patriotism or progress; be it further

Resolved, That, recognizing in loyal citizenship the strongest safeguard against anarchy, we call upon every American to do his whole duty as a citizen, to create and maintain a quickened public sentiment which shall not only aid in the enactment of wise and just laws, but shall compel them to be respected and enforced. We most especially urge our courts to aid in such swift and certain administration of justice as shall command the respect and confidence of the people; be it further

Resolved, That we urge upon Congress to pass such immigration laws as, while enabling all honorable and worthy foreigners to become citizens, shall rigorously exclude from our country all who are unwilling to abide by its laws.

At the request of the chair the resolutions were unanimously adopted by a rising vote.

Secretary Benjamin's report reviewed the official acts of the Association during the past year, mentioned that steps had been taken toward forming branch organizations in Mariposa, Madera, Fresno, Kern, Lassen and Shasta counties. He reported receipts during the year as \$3516.50.

The treasurer's report showed a cash balance of \$2983.74. This was left from an original balance of \$2321.15, supplemented by receipts of \$3952.20 and reduced by a disbursement for the year of \$3289.61.

The report of the Committee on Legislation was read by John F. Davis of Amador, chairman of the committee. The committee made a number of recommendations, which were adopted, reiterating their statement as made at preceding conventions. These were referred to the Committee on Resolutions and appear there.

Dr. C. T. Deane, secretary of the California Oil Producers' Association, addressed the convention on the petroleum industry of the State.

Addresses were made by L. C. Aubury, S. M. Shortridge and Senator George C. Perkins.

The convention reassembled on the 23rd inst. for the third and concluding day.

A resolution was adopted recommending the reenactment of the Chinese Exclusion Act by Congress.

Congressman W. S. Wood addressed the convention, urging the drafting of any desired legislation immediately, so that it could be introduced at the meeting of Congress in December.

Congressman F. L. Coombs also addressed the convention.

The Committee on Resolutions, W. C. Ralston chairman, submitted its report as follows:

Resolved, That, in the judgment of this Association, the mining industry of this country, with its output of raw material amounting in 1900 to the sum of \$1,070,088.89 in value, its tremendous significance to the industrial prosperity of the nation and its still more splendid promise for the future, warrants and demands the governmental protection and assistance that can be adequately extended only through a cabinet department of the executive branch of the Government. We therefore heartily indorse the now national demand for a cabinet department of Mines and Mining.

Resolved, That the Committee on Legislation be requested to prepare a bill embodying the views of this convention on the proposition of having a Department of Mines and Mining, and that the same be submitted to the Executive Committee of this Association at its first meeting, so it can be immediately forwarded to our delegation in Washington.

Resolved, That we deem it the duty of this convention to place itself on record in favor of liberal encouragement and protection to all legitimate mining interests, and pledge ourselves to assist in every reasonable manner

any and all legislation, State or National, which is calculated to remedy existing wrongs. We recognize the gross injustice of permitting that class of land pirates which, by claiming land to be suitable for agricultural purposes that is manifestly and essentially unfit for any uses except mining, to attempt to wrest from purchasers of State lands their recognized equitable rights, and through perjury and distorted interpretation of the laws of the State to place serious obstacles in the way of large investments of money and important oil developments.

Resolved, That this Association again express its deep satisfaction at the justice of the policy and action of the Commissioner of the General Land Office, Binger Hermann, in his suspension from agricultural entry of a large area of probable oil lands in this State pending an impartial investigation of their mineral or non-mineral character, thereby preserving to the oil miners the mining rights which are theirs by both the letter and the spirit of the laws.

Resolved, That our Congressional delegation be and is hereby requested to use all honorable means to have enacted a law by which the location of petroleum placer claims might be so regulated as to secure to the locator the right to locate not to exceed 160 acres and give him an opportunity to make technical "discovery" of mineral as precedent to location. A measure of this nature is demanded by the peculiar conditions of the petroleum industry, and is necessary to give effect to the spirit and intent of the mining laws, and would be a wise adaptation to oil development of the tunnel site law and would work no injury to any legitimate industry.

Resolved, That in the problem of remedying the criminal abuses of the land and mining laws of the Nation by the wholesale attempts to secure as agricultural lands, by the use of so-called scrip and otherwise, great tracts of the public domain that are unquestionably mineral in character and which are recognized as mineral by the people who seek to secure them as such by subterfuge, legal technicalities and outright perjury, the petroleum industry faces the matter of most serious present concern to it in its relation to the Federal laws and their administration. We believe that this problem is peculiarly one in which the whole mining industry of the State is interested, together with the petroleum miners, and we solemnly pledge our highest endeavors to protect the heritage of the miner in the public domain in accordance with the letter and spirit of the beneficent laws which were intended by Congress sacredly to preserve the vast mineral resources of the public domain to the mining industry that their development might be encouraged and fostered. We distinctly favor the proposition that where a contest takes place between a scripper and a miner in any department of the United States Land Office, the burden of proof shall be placed upon the scripper and not on the miner.

Resolved, That we look forward with pardonable pride to the early construction, already assured, of the restraining barriers for which \$650,000 has been appropriated by our State and national Governments. We heartily approve the plans and recommendations of the California Debris Commission for the construction of such restraining barriers as outlined in their official report of 1899 to the Secretary of War, and we hereby request our delegates in Congress to use all honorable means to secure such added national legislation and appropriation as may be necessary to carry such work to a final and successful completion; and be it further

Resolved, That we favor the construction at the earliest possible date of additional restraining dams and barriers upon the tributaries of the Sacramento and San Joaquin rivers and their branches, to the end that hydraulic mining may be resumed in all parts of the State adapted thereto.

Whereas, There is an absolute, urgent and immediate necessity for the segregation of the mineral lands within the railroad land grants of the State of California in order that such mineral lands may be restored to the public domain and thus made available to the mining prospector. These mineral lands were especially excepted from the railroad land grants and have never been granted by the United States Government to any railroad company, and were intended to be specifically preserved as a part of the public domain, open to exploration and purchase under the Federal mining laws. The task of securing a proper and effective classification and segregation of the mineral lands within the railroad land grants in California was undertaken several years since by the California delegation in Congress, through the suggestion and co-operation of the California Miners' Association, but the efforts thus made have been so far unavailing. It is now believed, however, that a more opportune time has arrived for the accomplishment of this desirable work; and, therefore, be it

Resolved, That our committee upon mineral lands be instructed to use all honorable means at its disposal to secure such legislation at the hands of our National Congress as will bring about the desired results, and we furthermore request our Senators and Representatives in Congress to urge upon the Congress at its ensuing session, commencing in December next, to enact such legislation as will promptly, effectually and finally classify and segregate the mineral lands within the railroad land grants of California, to the end that such mineral lands may be again thrown open to exploration and purchase in the same manner as are the other mineral lands of the United States under the Federal mining laws regulating such exploration and purchase. And we further recommend that, if deemed necessary, and with the advice of the executive committee of the Association, that a personal representative be sent to Washington to represent the interests of the miners of California in this matter.

Whereas, Opposition to the efforts of certain of our fellow miners to operate their hydraulic mines under the Caminetti law has been made in the courts of the State and more suits of a similar character are threatened; and, whereas, while the injunctions obtained in the cases already brought under a ruling of the court that the licenses in these particular cases were not regularly issued, the constitutionality of the law has been challenged; now, therefore, be it

Resolved, That the executive committee of the California Miners' Association shall determine the constitutionality of said law in the courts of last resort by defending a test case brought against a miner holding a regularly issued license by the California Debris Commission.

Whereas, Complaints have been made to this Association that certain parties, for the purpose of fraudulently procuring title to mineral lands, in many cases where mining claims are situated thereon, make and file lieu, forest reserve and other scrip, and procure persons to make false non-mineral affidavits to be filed with and to complete such fraudulent entries; and, whereas, miners holding such mining locations are often unable to contest such fraudulent locations; therefore, be it

Resolved, That he or they may lay such facts, with the names of his or their witnesses, before the secretary of this Association, whose duty it shall be to lay the names before the Federal Grand Jury for the purpose of having the maker of such false non-mineral affidavits prosecuted for perjury and such locators for subordination of perjury.

Resolved, That we recognize the fact that the future development of the State depends in a large measure upon the future development of its water resources and the preservation of its forests; therefore, we favor the immediate and thorough investigation of, and report on, our water resources, and the best methods of improving and developing the same; the collaboration of the Federal and State Governments in such investigations; and the proper appropriations therefor by our State Legislature. We desire and urge upon the Federal Government that all public forests be reserved from sale, and the establishment of a forest patrol, and we favor the enactment by the State Legislature of such penal laws as will lessen the danger from forest fires.

Resolved, That we heartily favor the amendment of Sections 2319, 2320 and 2324 of the Revised Statutes of the United States, concerning the location of mining claims, so that the locator shall be accorded a reasonable and definite time within which finally to mark his surface boundaries on the ground, so that all local rules, regulations and customs of miners and all State and Territorial law on the location of mining claims shall be abolished, and so that, while liberal provision shall be made for the protection of the locator who holds and works his claim in good faith, the law concerning annual assessment shall most effectually check the present injurious practice of holding mining claims year after year without development. Be it further

Resolved, That we recognize the importance of the passage of such amendatory legislation and urge the necessity of action upon our Committee on Legislation and the California representatives in our National Congress.

Whereas, The great mineral wealth of the State is increasing from year to year and greater demands are made upon the State Mining Bureau, therefore be it

Resolved, By this convention that we earnestly request our legislators to be liberal in their appropriation for the support of this bureau.

Resolved, That the California Miners' Association, in convention assembled, does hereby indorse the present administration of the State Mining Bureau, and commends State Mineralogist Lewis E. Aubury for the active manner in which he is promoting the mining interests of California.

Whereas, The California Club, composed of a large number of patriotic women of this State, is using its utmost efforts to preserve the Calaveras grove of big trees to the people of the United States, and without which efforts the vandal hand of sordid commercialism would have destroyed said big trees; now, therefore, be it

Resolved, That this convention indorses the efforts of said club and will do all in its power to promote such legislation, either State or national, as will accomplish the object sought.

Whereas, The Chinese Exclusion Act, so called, is about to expire; and, whereas, upon its expiration, unless Congress shall enact another law of similar purview, this country, and particularly the Pacific States and Territories, will at once be flooded with Chinese; and, whereas the Chinese race has been proved to be wholly unassimilable with the Caucasian; and, whereas, the Chinese civilization in our midst has been proved to be wholly alien to ours and our institutions, and the presence of the Chinese among us to be a blight and a curse upon our people; and, whereas, we cannot but look forward with dismay and alarm to that untoward event which shall precipitate upon our shores the alien hordes of Asia without let or hindrance; therefore, be it

Resolved, That we hereby request our delegation in Congress to endeavor to procure the enactment of another Chinese Exclusion Act; and that we further hereby request our said delegation, in the prosecution of its efforts in this behalf, to exercise the greatest diligence and vigilance.

Resolved, That this Association holds itself greatly indebted to the public press of San Francisco and the mining counties for the assistance it has given, not only to the Association, but to the mining industry of California during the past year.

The report was adopted unanimously.

The Association concluded its meeting with the election of officers for the ensuing year. The officers elected are: President, E. C. Voorheis of Amador county; first vice-president, Frederick Zeiler of Nevada county; second vice-president, Lewis E. Aubury of Los Angeles county; third vice-president, M. E. Dittmar of Shasta county; secretary, E. H. Benjamin of San Francisco; treasurer, S. J. Hendy of San Francisco. They constituted the old board of officers and were re-elected, with the addition of M. E. Dittmar, who occupies the office of third vice-president, which was created by amendment of the by-laws of the Association, so that the northern counties, about to form a Miners' Association of Northern California, might receive a proper recognition in the State body.

## Seven Devils Copper Mines, Idaho.\*

The Seven Devils mining district is situated in Idaho county, Idaho, and includes a portion of the mountain range which extends along the right bank of the Snake river, between the mouths of the Weiser and Salmon rivers. On the west side of the range only short, unimportant torrential streams drain from the high summits directly into the Snake river. On the east side of the range the Weiser river, flowing south, and the Little Salmon and main Salmon rivers, flowing north, isolate the range from the other mountains of Idaho, except by the relatively low divide, midway of the range, separating the drainage basins of the Salmon river and of Weiser river.

That copper existed in these mountains was known many years ago, and all but forgotten, until about three years since, when the rising price of copper and the extent and richness of the Seven Devils deposits started their exploitation coincident with announcements that tended to create the idea that the discovery was a new one. The mines are high up among the summits of the range. Even with the navigable Snake river at the western base of the mountains in air lines from 3 to 15 miles distant from the mines, it is available for very few of them for transportation service. The most practicable route of transportation has been found on the east side of the range, past the divide at the head of the Weiser river, and by the valley of that stream to the city of Weiser, on Snake river, and the O. R. & N. Railroad. From Weiser northward the P. & I. N. Railroad has

daily. On the Decorah the lower tunnel is in 570 feet; a second tunnel, 150 feet higher, is in 360 feet. Above this is an upper tunnel, in about 170 feet, which is being mined out into an open cut or quarry by the removal of ore, to prepare a site for the sinking of a shaft. The diamond drill has been freely used in prospecting to prove and measure values in the ground in advance.

The ore is of excellent average grade and much of it already taken out is of high grade. From the Peacock mine fourteen cars of ore sold in Salt Lake City, Utah, netted, smelter and railroad charges deducted, \$1300 a car.

From the South Peacock two cars of sorted ore shipped went 72.5% copper. From the Helena ten cars of ore were shipped which netted \$17,000. The company consider that, with their present depth of development from what they regard as their proved ore bodies, they could ship 400 tons a day for a year. L. W. Hall of Weiser is president of the company and W. B. Hancock manager at the mines.

We are indebted for the illustrations to the courtesy of R. E. Lockwood, proprietor of the Weiser, Idaho, Signal.

### Rapid Shaft and Tunnel Work.

The actual work on the shaft and tunnel at the L. I. & S. Co., Stony Point, N. Y., for which Schroeder & Bartl were the contractors, was commenced on May 1, 1901. On May 20 it had been carried to a depth of 35 feet in the east shaft, and on May 26 the west shaft had reached a depth of 37 feet. This was through soft material and it was necessary to use 10x10 timber cribbing. At the depths given rocks

as fine a color as the best aluminum. It is not so hard and short as a 33% zinc alloy, nor quite so strong, but has supplanted it for most purposes because of its better working qualities and greater reliability under shock. It is at present in use for scale beams, surveying and astronomical instruments, light machine parts, gear wheels cut for blanks, cash registers, calculating machines, testing machines, indicator drums, surgical appliances, cases and parts of pneumatic tools, etc. It is non-magnetic, and therefore particularly useful in scientific instruments.

### Mining Laws of Mexico.

Permission must be obtained from the Government in Mexico before prospecting. This permission can be obtained from the nearest mining agency for a fee of \$3 if it is Government land, and the permit designates the land and gives ninety days exclusive rights of prospecting. As much as 1550 acres can be included in one permit. Where the land is in private ownership permission must first be obtained from the owner. If the latter refuses permission an appeal can be made to the mining agent, who has authority to grant the permission. On the expiration of the ninety days on Government land the right of denouncement, the equivalent of our location, is open for six months, after which, if there is no denouncement, the land is again open for exploration under a permit obtained as described.

What is called the denouncement is filed with the local mining agent, together with a fee of about \$30. The agent publishes the denouncement three times, and appoints a Government surveyor to survey the

Quarrying Ore From Open Cut, Decorah Mine, Seven Devils District, Idaho.

Upper Tunnel, Helena Mine, Seven Devils District, Idaho.

been constructed 60 miles to Council, leaving 45 miles yet to be built to get the road to Landore, its terminus for the Seven Devils mines.

Among a notably large number of copper properties in the district that the development work of the last three years has demonstrated to be valuable mines, the Boston & Seven Devils Copper Co. have the one, some views of which are herewith illustrated. The property comprises some twenty-five claims, all prospected, and four—the Peacock, South Peacock, Helena and Decorah—well developed and in productive operation. In addition to the mines, the company has in construction near Weiser a smelting plant of 180 tons daily capacity, with provision made for its ultimate enlargement to a capacity of 2000 tons daily. Some of the principal stockholders are among the principal people interested in the railroad now building toward the mines, so that the essential elements in the business are closely allied.

Pending the early completion of the smelter and the interval of a year that it is estimated must yet elapse before the railroad can be completed to Landore, the company is hauling ore by wagon in summer and by sled in winter to Council, and claims now to have over 10,000 tons piled up there ready for the smelter when it blows in. More ore is being stored in bins at Landore, and the company's plans provide for building a gravity train from the Peacock and South Peacock mines to Landore.

On the Peacock mine a double-compartment shaft has been sunk 175 feet, and a tunnel is in 420 feet, connecting with the tunnel. Through these openings about 1000 tons of ore are being taken out daily. On the South Peacock there is a shaft down 360 feet, with stations and levels at each 100-foot point. At the bottom of this shaft a diamond drill bore is being made on the dip of the vein to explore it in depth. This mine, it is considered, can output about seventy tons daily.

On the Helena mine there are two tunnels, one 160 feet in, and the other, 170 feet lower, is in 430 feet. This mine, as now opened, can produce fifty tons

were reached and blasting was commenced, using hand drilling. The shafts were sunk 15 feet by hand and on June 1 air was started through 3-inch pipe, and on July 20 both shafts were finished, the east one being carried down 60 feet below the cribbing and the west one 54 feet.

The tunnel was then started and driven 387½ feet, making a total distance in shafts and tunnel of 500 feet, driven in forty-eight days. After finishing the rock work the tunnel was lined with brick and concreted between the brick wall and the rock. The shafts were finished in the same way. In the air drill work two Ingersoll-Sergeant "D" drills were used in each face or heading. There were about 300,000 bricks and 1100 yards of concrete used, the latter being machine mixed.

The work was completed September 14. The location of both shafts is about 50 feet south of the Lake Erie shore.

The alloy of three parts of aluminum to one part of zinc is the most generally useful of all the aluminum-zinc alloys. It has a tensile strength of 35,000 pounds per square inch and an elastic limit nearly the same, with slight elongation before breaking. It is therefore not a malleable alloy, but yet it is not brittle, for it bends slightly before breaking. This quality is a valuable one, for it enables one to straighten out a casting to a certain extent under the hammer. Remarkably clean and sharp castings can be made with it, when experience has been attained with the proper gating of the mould and the exact temperature of casting. As with all these alloys, overheating in the crucible must be scrupulously avoided, as well as the use of iron stirring implements, since oxide or dross does not separate out of the metals easily, and may thus get poured into the mould and injure the casting. Its specific gravity is 3.4, and the contraction taking place during alloying is therefore 14%, which indicates a close and intimate combination. This alloy, when properly made from the pure metals, is all that can be desired in its working qualities, being equal to the finest brass in the lathe, under the drill, and in not clogging the file. It casts sound, takes a polish and has

tract. One pertenencia, which is is about 2½ acres, or any number of pertenencias can be denounced at one time for the same fee of \$30. Within sixty days from the filing the surveyor must make the survey and return it to the agent within sixty days from his acceptance of the appointment to survey. The surveyor's fees amount to from \$25 to \$100, according to the area and the terms made with the claimant. On making the survey the claimant can reduce his claim if he chooses. Monuments are placed marking out the ground. The return of the surveyor and the other papers in the denouncement are sent by the mining agent to the Department of Encouragement within sixty days after depositing the plans of the survey with the agent. They are sent back for errors and protests can be made to the agent before the plans are forwarded, in which case a notice is posted to bring the parties together.

If the plans are approved a stamp tax of \$10 (Mexican) must be paid, a pertenencia and the title papers are then signed by the President of the Republic and delivered to the denouncer within a few weeks after the payment for the stamps. The title papers go then to the Finance Department and are recorded, and an annual tax of \$10 a pertenencia can be paid in full in advance or in advance for four months at a time. A delay in payment for a month adds 50% to the tax, a delay of two months doubles it, and a delay of three months works an absolute forfeiture and opens the ground to denouncement again regardless of the improvements and expenditures made. It is illegal to work a mine for profit and to export ore until the title has been granted. Little attention is paid to this, however, and prospectors have at times shipped thousands of tons before receiving title.

The restrictions thrown around incorporated companies are rather more onerous than around individuals. Copies of incorporation papers and by-laws must be filed after translation into Spanish. A deed is then made to the company. Other papers must then be signed and the company appoint a local agent. Many of the details are small but conforming with them is essential. A violation would result in litigation.

## Subaqueous Tunnel Siphons in Boston, Mass.\*

By W. W. CUMMINGS.

The first shaft was sunk on the Everett side of the Malden bridge, as near the abutment as the retaining wall would allow. After going about 6 feet the steel caisson was erected and sunk in the ordinary way (Fig. 1), paving stones being placed on the shelf

FIG. 1.—STEEL CAISSON AND SEGMENTAL LAGGING USED IN SINKING SHAFT OF MALDEN SIPHON TUNNEL, AT BOSTON, MASS.

at a and the excavation carried on under the cutting edge b. The casing was kept plumb by varying the excavation and also by such guides as might be used at the top. The caisson was extended by removing

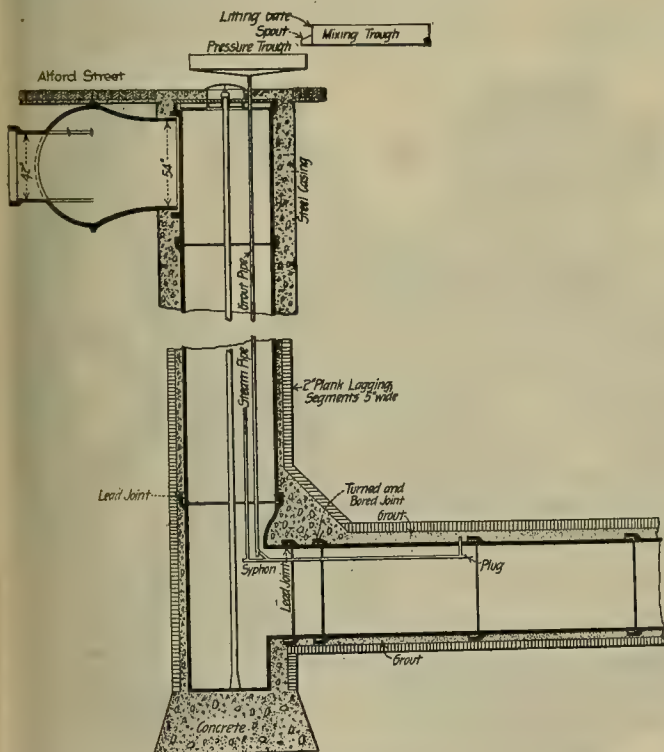

FIG. 2.—SHAFT AND SHORT SECTION OF CHARLESTOWN SIPHON TUNNEL, SHOWING METHOD OF GROUTING CAST-IRON PIPE IN PLACE.

the air lock and inserting a 10-foot section, calking the flanged joints when necessary. This shaft was 46 feet deep, 43 feet below high water, at which times, of course, the air pressure was about 23 pounds.

The steel casing was made of  $\frac{3}{4}$ -inch boiler plates,

\* Condensed from a paper read before the Boston Society of Civil Engineers.

riveted to a 3-inch angle iron, which, with the corresponding angle iron of the next section, formed a flanged joint that was made up with red lead and calked where necessary. The inner diameter of the tubing was 7 feet and the length of a section was generally 10 feet, each section weighing about 4000 pounds.

The cutting edge was made on the first section by placing a wide flange about 2 feet back from the bottom and staying it with brackets, as shown at a. On this shelf the paving stones were placed, to balance the upward pressure of the air and to furnish a downward thrust at the cutting edge. Stones, piles, sunken timbers, etc., were broken up and taken out through the lock. When material sufficiently compact to prevent the escape of the air was reached the sinking of the caisson was stopped, and the lagging was carried down the shelf, as shown in Fig. 1.

This lagging consisted of circular segments 6 inches wide, sawed from 2-inch plank and having an outer diameter of 7 feet. There were eight of these segments to a ring, and they were placed by spiking to the previous work with 7-inch spikes, each ring breaking joints with the previous one. This construction, which was the same as that used in the tunnel proper, was found to be exceedingly rigid.

A few feet above the point where the tunnel was to be started the tubular form was changed and the "goose neck" was started. This consisted in constantly lengthening that diameter of the shaft parallel to the axis of the tunnel, on the side from which it was to start, until room enough was obtained to turn a 54-inch pipe, 8 feet long, into the tunnel. In this "goose neck" the sides were necessarily flat, but, being surrounded by stiff clay at this shaft, they showed no sign of weakness. At the Charlestown tunnel, however, the material was sandy and the side came in.

The shaft was driven 6 feet below what was to be the bottom of the tunnel, and 4 feet of concrete was put in as a foundation of the pipe that was to make

FIG. 3.—SHIELD FOR DRIVING MALDEN SIPHON TUNNEL WITH SEGMENTAL WOOD LINING.

lagging. This served a double purpose, pushing the shield forward and closing up the joints in the lagging, although, as the lumber was thoroughly dry when placed, it was found that the swelling of the wood made very tight work. The lagging was given a wash of cement after it was placed, and such leaks as showed were calked with wooden wedges and yarn, and by feeding dry cement into the holes the escaping air under pressure carried the cement with it.

North of the draw the tunnel ran beneath an ice guard, and the bottom of the piles had to be cut off in the heading. This occasioned no great hardships, while the driving was in clay, but about three-quarters of the way across the river a streak of silt and sand was struck, which, being only 7 feet thick between the top of the tunnel and the bottom of the river, followed the piles into the heading and stopped the work.

Poling planks were driven ahead, similar to those shown in Fig. 4, and cut so that the ends could be worked back on the cutting edge of the shield. Gunny sacks, filled with horse manure, sawdust, etc., were thrust into the cavities and, as soon as the holes were plugged, they were quickly plastered with clay. The material ahead was then excavated and the shield pushed forward. The surrounding material was so soft and unstable that the lateral movement of the shield was scarcely controllable, the whole structure moving toward the side that caved in.

As a whole, however, after the soft material was passed and the transit line extended, the headings met within 0.42 inch. The tunnel was allowed to fill with water and to remain filled for a few days to give the woodwork a chance to swell and to permit the silt to pack about the lagging.

To a great extent this closed the remaining leaks, so that a 3-inch pulsometer easily kept the water down after the air pressure was removed. After pumping the tunnel out a cross-section was taken and this, compared with the one taken before, showed that the tunnel had flattened about  $\frac{1}{4}$  inch, thus proving that the lagging would not be permanent of itself.

In giving the line of the tunnel the distance between the shafts was triangulated and the direction transferred to the tunnel by means of two wires which passed through holes tapped in the air lock. This gave a base line about 4 feet long, which was produced into the heading by means of nails in the roof of the tunnel.

In this tunnel it was decided to lay pipe 54 inches in diameter, 8 feet long, with turned and bored joints. The pipes were lowered into the shaft on the Boston side of the tunnel, turned on a pair of skids in the "goose neck," and drawn through by an engine at

FIG. 4.—SKETCH SHOWING POLING-BOARD METHOD OF DRIVING MALDEN SIPHON TUNNEL.

FIG. 5.—SECTION SHOWING METHOD OF CONCRETING CAST-IRON PIPE, CHARLESTOWN SIPHON TUNNEL.

the leg of the siphon. (Fig. 2.) The shaft on the Boston side was then sunk in the same way, and the tunnel started from that end.

In driving the tunnel a shield was used similar to the Greathead design, as shown by Fig. 3. The excavation was carried about 2 feet ahead of the shield in good digging, and the latter was pressed forward by the hydraulic jacks a, a, bearing directly against the

the other shaft. A piece of timber was fastened to the tunnel, and the joints were forced home by a hydraulic jack which rested against it.

Between the pipe and the lagging was a space varying from nothing, where the lagging was cut out to improve the alignment, to 6 inches at a point diametrically opposite. This space it was proposed to fill with grout under pressure. The engineers made

a series of experiments as to the action of different cements and mixtures under conditions similar to those on the work. In each case grout was made and poured into a pan containing salt water. All the cements to which lime had been added remained like so much mud; some of the cements with high records caked like dirt, while some of the cheaper, low-grade cements took a quick initial set, which, of course, was what was wanted in this case. It was found that one brand of cement, into which steam was turned, became soft and slippery like paste and set very quickly. A jet of steam, acting on the principle of an injector, was accordingly used, the grout being mixed in a trough at the top of the shaft and carried down by 1½-inch pipes. (Fig. 2.) In laying the 54-inch pipes bulkheads had been built between the pipe and the lagging every 25 feet or more. Each length of this pipe had a hole for a ½-inch pipe tapped in its top, and into these holes the grouting pipes were successively introduced, the progress of the grouting being watched through the holes in the succeeding pipes, and these holes being plugged when the grout began to appear.

The steam jet was in the shaft, and as the reach from it to the introducing hole became greater and the time changing forward became longer, the injector became plugged with cement and was finally abandoned, the pressure due to the height of the mixing trough being used and the pipe washed out with clean water after each succeeding run. When the distance became too great to get the desired pressure by this method, the grout was mixed in the tunnel and injected by means of a force pump.

From time to time the plugs were withdrawn from the top of the tunnel, and the grout cut through with a drill to determine its set and fill. The best results were obtained when the steam jet was used, the cement seeming to have swollen in setting. Where the cavity was not entirely filled the force pump was used to finish the work. In the shafts the pipes were concreted fast as placed, the steel casing being left in.

In driving the tunnel the water was taken care of by two 4-inch pulsometers, and by two steam ejectors rigged tandem—that is, one at the bottom of the shaft and one half way up. On the completion of the tunnel the water of condensation and leakage amounted to four and one-half barrels per day.

The tunnel was finished December 1, 1899, and gas was turned on about December 3. The dripage decreased to two and one-half barrels a day in summer, and increases to nineteen and one-half barrels a day in winter.

**CHARLESTOWN TUNNEL SIPHON.**—The Charlestown tunnel was commenced as soon as the air lock could be spared from the Malden tunnel. The shafts were sunk in midstream from temporary platforms, and did not differ materially from those of the Malden tunnel.

For convenience in handling the water in working from both shafts at once, the summit was placed between the shafts. This tunnel was driven without a shield, under an air pressure of 28 pounds, the clay being stiff enough to maintain the heading except in one part where gravel was encountered in the roof. Here poling boards, horse manure, etc., were used, as in the Malden tunnel, except that the poling planks were worked back on the lagging when cut off, instead of the shield, as in that tunnel.

The "goose neck" was turned in less favorable material in this tunnel, and on removing the bracing the flat side broke in. After ineffectual attempts to patch it a concrete lining was placed, as thick as would allow the introduction and turning of the pipe. These were common bell and spigot pipe, 12 feet long, and were made up with cement joints. The pipe was placed in the shaft on the Boston side first, and the concrete was brought up to the top of the steel caisson. The tunnel pipe was then started at that shaft and laid toward the Charlestown side.

A 3-inch pipe, provided with open tees, was suspended in the roof of the tunnel, and each length of 42-inch pipe was concreted as it was placed. The concrete was mixed over the shaft and dropped through a chute to a car that ran inside the pipe already laid, and was then dumped, remixed and rammed by men standing alongside of the pipe. (Fig. 5.) Around the joints the concrete was made stronger and greater care was used to make it impervious to water. When the pipes were all laid and concreted the 3-inch pipe in the roof was flushed with grout. The shafts were protected by circular fenders, and also by outer channel fenders.

**RIVER STREET TUNNEL SIPHON.**—In the River Street tunnel the Brighton shaft was sunk 90 feet, and the Cambridge shaft 60 feet. It was commenced by sinking the Cambridge shaft without the steel caisson and running the tunnel in 80 feet without compressed air. At that point the clay changed to a vein of sand, and the heading came in, filling the tunnel for 40 feet and destroying the cross-section.

The general method of procedure was as is shown in Fig. 4. Poling planks were driven ahead, a couple of feet of sand was excavated, the surface was smeared with clay to hold the air and a bulkhead was thrown across. The clay bottom was then excavated, the lagging brought forward and a new start made in the sand. Progress was from 1 to 3 feet a shift in each heading.

The results in alinement were such that it was

necessary to make two offsets of 2 feet each to keep the transit line in the tunnel. Nevertheless the closing error was less than 0.05 foot.

**COST AND QUANTITIES.**—The cost of the Malden tunnel was \$34.35 per linear foot for driving the tunnel, \$15.50 per linear foot for the pipe, and \$4.80 per linear foot for laying the pipe and grouting, or \$55.64 per linear foot complete. On the Charlestown tunnel the cost was as follows: Driving and fenders, \$87.45 per foot; pipe, \$4.35 per foot; laying, \$9.60 per foot; total cost, \$101.40 per foot. The quantities were as follows: Concrete, 420 cubic yards; 42-inch pipe, 85 tons; cement, 260 barrels, at \$2.35 to \$2.75; sand, 200 tons, at 70 cents; stone, 600 tons, at \$1. At the River Street tunnel the cost was as follows: Driving, \$48.84 per foot; laying, \$45.45 per foot; pipe, \$5.36 per foot; total cost, \$99.65 per foot. The quantities were: Concrete, 560 cubic yards; stone, 1303 tons, at \$1.10; sand, 97 loads, at \$1.60; 48-inch pipe, 169 tons; cement, 859 barrels, at \$2.35 to \$2.75. Cost of labor on concrete in tunnel, about \$5 per cubic yard; cost, complete, of concrete in tunnel, about \$9 per cubic yard.

In these tunnels it has been demonstrated that in good clay, and in good clay only, a tunnel can be advantageously driven without a shield under compressed air; that the segmental lagging is an easy, economical and stable method; that breaks, even in bad ground, are neither necessarily dangerous nor prohibitively difficult; that a large tunnel, with concrete between the pipe and the lagging, although more costly than a smaller tunnel grouted, makes much tighter work; that turned and bored joints are a delusion and a snare; that it pays to point up the joints on the inside of the pipe with cement; that cement joints give the best results, and are the cheapest and most convenient; that lathing and plastering the lagging with cement, while under compressed air, is an advantage.

G. H. Finn is the general manager, and L. J. Hirt was the chief engineer of the Massachusetts Pipe Line Co. W. E. Silsbee had immediate charge of the Malden and Charlestown tunnels, E. C. Hayden had immediate charge of the River St. tunnel.

#### Sturtevant Centrifugal Spring Roll.

Centrifugal rolls, as formerly constructed, were fast running, for it was by peripheral speed that their great centrifugal crushing pressures were attained; but for some hard and coarsely crushed ores too high speed was found not always an advantage, by reason of excessive wear of the tires.

Experience has demonstrated that for each ore with roll crushing there is an economical tire speed, which is always indicated by tire endurance. When this fails, the rolls are running too fast and the speed must be reduced.

This experience has resulted in the invention of centrifugal rolls that can be run at any number of revolutions, fast or slow, that practical conditions require, and with uncommon pressures. The centrifugal spring roll, herewith illustrated, is claimed by

plain centrifugals, neither roll, shaft or bearing moves back at all.

The cut illustrates a 32" centrifugal spring roll. To those who need a fast running roll, this machine of moderate size, it is claimed, will give a large output. To propositions requiring moderate tire velocities, this offers a machine of great capacity. The centrifugal spring roll runs easily and does its work with little wear and tear.

The Sturtevant Mill Co. of Boston, Mass., has issued an 80-page circular, which will be mailed to them on application, fully describing these machines and others of their manufacture.

#### Possibilities and Limitations of Electric Pumping.\*

NUMBER III.—CONCLUDED.

By LEWIS A. HICKS, C. E.

These considerations lead naturally to mounting the two pumps in a steel frame with bypass valves arranged that the first pump may deliver direct discharge or be thrown in series with the second when the lift becomes greater than the economical range of the first pump. Both runners are on a common shaft which immediately above pump No. 2 would be coupled to the shaft of a vertical motor, for motors in all, one above the other, being required each motor being mounted independently so that could be uncoupled and taken out without disturbing the others. Thus, when operating just below station level with a low lift, current would be supplied to the field coils of one motor and the low pump would be in operation while the runner of pump No. 2 and rotors of the remaining three motors would be running idle until the load and lift increased beyond the range of one motor when another could be cut in. In this way both pumps and motors would be operating more closely under economical full load conditions than if constructed as a single unit.

A telescope joint in the discharge pipe firmly fixed in one corner of the long frame would allow the lowering of the pump 18 feet as the water level receded and the uncoupling of an adjustable ball and socket joint would permit the telescoping of the pipe at the insertion of another length, thus allowing another gradual lowering. The entire assemblage would be handled from a hoist above, and motors would be protected from water by light sheet iron hood.

Such a combination worked out to suit local conditions anywhere would provide a much more efficient mechanism than those now in use, as the initial stage of any mine pumping—and would be equally useful whatever method were adopted for handling the water out of the mine.

If the water were permanently lowered to a given level, from which a high lift was required, some form of pressure pump, equipped with Riedler valves and cranked to the extended shaft of specially worded motor would best meet the requirements, but for lower levels, at least during the lowering process, the writer would propose centrifugals at each station.

Sturtevant Centrifugal Spring Roll.

the manufacturers, the Sturtevant Mill Co. of Boston, Mass., to have these desirable features. To each of the weights in the plain centrifugal roll has been added a set of powerful springs. These constantly press the weights out and hold the tire, even when the roll is at rest, with a force equalling the pressures given to common rolls by their outside springs. Centrifugal spring rolls, therefore, exert at the slowest speeds at least common roll pressures. As in

level in series, on the ground of flexibility and convenience in extending the system.

Compressed air for ventilation and machine oils must be always available for mining operations, and station motors could be protected from accidental flooding by light, watertight iron housing, into which

\*Submitted for discussion at the fifth annual convention of the Pacific Coast Electric Transmission Association, San Jose, Cal., June 18-19, 1901.

compressed air could be admitted to prevent the plates from buckling under water pressure, and the same means could be used to secure ventilation when the motor was in operation. Such a system would compare favorably in performance with anything now in use, and, in case of back flooding and accident to any of the submerged motors, the sinking pump would be available to work down from whatever level the water reached while no power was available.

Another use which the writer believes will be found for centrifugals is that of hydraulic mining. There are many locations where placer ground has been above available water supply which, with cheap electric power operating gangs of centrifugals in series, can be profitably worked.

It had been my hope for some time to present tests of a quadruplex centrifugal at this meeting, which will throw new light on a number of disputed points. The plant in question was originally designed under the writer's specification to pump 2800 gallons of water per minute from the Colgate penstock of the Bay Counties Power Co. to Lake Francis, a distance of 2 miles, with a vertical lift of 430 feet. Surplus water delivered by the flume during the period of light load was to be used on the Colgate drop to generate power to drive a 500 H. P. synchronous motor operating the pumps on the load mentioned, while during peak conditions the motor would be disconnected from the dumps and driven as a generator by a water wheel using water from the pump main under pressure head from Lake Francis, and the water so used would again be available on the Colgate drop for increasing the output beyond the capacity of the flume. Changes in the plans for handling the peak load eliminated the condition which had made the plan desirable, and it was now being finished up for use in moving several hundred thousand yards of earth, by sluicing, into the raising and reinforcing of the embankment forming Lake Francis. A similar pump, on a smaller scale, is now in successful use in placer mining operations in the central part of the State and offers the advantage of a large quantity of water under low pressure for cleaning up and hauling away material broken out with a smaller stream under heavy pressure.

**CENTRIFUGALS FOR WATER WORKS.**—The limits of this paper will only permit me to touch briefly this branch of the subject, which in itself might easily occupy the entire time assigned to me. Much of what has been heretofore said in regard to irrigation is applicable to small water works, and the centrifugal will find an enlarging field of usefulness in this direction. The economy of small centrifugals delivering 1000 to 1500 gallons per minute, can be maintained, if properly designed through a considerable range of draft and pressure within quite narrow margins. A test by the writer of such a pump shows less than 4% range in efficiency when pumping from 700 to 1400 gallons per minute and with changes in pressure from thirty to forty-six pounds, the range of lift being from 70 feet to 110 feet.

In larger plants for city use, electric applications come in direct competition with the most highly specialized and efficient machinery made, and the comparison between modern vertical triple expansion pumping engines, with pump and steam cylinders in line, and the best forms of power pumps, direct geared to motors, with the necessary speed reduction between motor and pump, if made on the basis of efficiency, cannot fail to flatter the high-duty pump. In such cases, however, efficiency may not tell all the story, and it may well happen that the advantages incidental to cheap water-generated current—relatively low first cost of apparatus used and economy of attendance—will more than overcome the difference in efficiency. In electric applications on a larger scale an economy of 250,000 foot-gallons per kilowatt hour should be attained against a possible comparative performance of 300,000 foot-gallons by the best steam pumping engines.

The ultimate economy of either plan is a matter of nice engineering investigation which requires complete data of fuel, power and investment costs in conjunction with accurate knowledge of what may be expected in the way of performance by existing apparatus. It must, however, be apparent to any one familiar with the subject that the issue is an open one, and that local conditions may easily overbalance other considerations and make the electric plant the more economical.

Manufacturers become the repositories of accumulations of specialized information pertinent to their own line of work, but the writer believes it to be the province of the engineer to keep so closely abreast of the best practice as to be able to give his clients the advantage of selecting the apparatus best suited to his requirements, and such advice is valuable proportionately as it is based on a comparative knowledge of all the apparatus available.

The writer wishes to disclaim any prejudice or preference for any particular style of pump, and would consider himself bound to use or recommend for a given duty the pump best suited to perform it. If there is any leaning in his mind toward a rotary or centrifugal type, it is because of the advantages and possibilities offered by reason of the single-revolving element in direct connection with electric motors; but the prominence of this thought is due simply to the fact that the discussion is understood to be concerning electric apparatus.

## Mining and Metallurgical Patents.

Patents Issued October 15, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

**ORE FILTER.**—No. 684,654; C. Voelker, Helena, Mont.

A funnel-shaped tank having an annular flange at upper end, a top or hood having annular flange at lower end for engaging over first-named flange, an open-work filter holder arranged in tank and conforming to its shape, a filtering material engaging against inner surface of holder, the filtering material having lower end secured at lower end of holder and upper end secured between flanges and screw for operating in tank.

**MACHINE FOR EXTRACTING PRECIOUS METALS FROM ORES.**—No. 684,672; L. Chandlee, Colorado Springs, Colo.

A pan mounted upon a suitable standard, mercury carried in pan, a disk adapted to be moved on surface of mercury comprising upper and lower plates and spacing cross-pieces, disk being closed at periphery, a hopper mounted in center of disk, means for supporting disk at edge so that it may be revolvably held above pan, a porous cup mounted in hopper and resting upon an insulating block in pan so that cup will engage mercury but will be insulated from pan, an anode consisting of a metallic cylinder connected with one pole of any source of electricity, the cylinder being inserted in porous cup and in chemicals contained therein, a cathode connected with other pole of electrical source and extending into mercury in pan, and means for revolving disk, structure being such that pulverized material delivered into hopper will be worked outwardly to periphery of pan upon surface of mercury, the mercury being kept in a

quick and attracting condition by electricity passing from anode to cathode, and means for collecting overflow from pan comprising a trough arranged around base of machine.

**HOISTING AND DUMPING MACHINE.**—No. 684,768; G. H. Bowers, Salida, Colo.

A stationary frame, a tilting bucket frame, a supplemental frame having projecting journals passing through side bars of bucket frame into stationary frame and forming axis of bucket frame, offsets on supplemental frame which co-operate with bucket frame, a mutilated gear on one journal of supplemental frame, a rack bar co-operating therewith, a drum geared to rack bar, a bucket, a hoisting cable wound upon drum and means for operating drum.

**AIR COMPRESSOR VALVE.**—No. 684,565; W. H. Caster, Angels Camp, Cal.

A cylindrical casing having a valve seat formed at one end, an enlarged counterbored turning flange at opposite end and screw threads by which it is fixed in operating position, a valve consisting of a head fitting and closable against seat, a cylindrical body slidably guided within casing having a groove or channel turned around its central portion and a groove around outer end, pins passing through sides of casing entering central groove or channel, acting to prevent valve from being disengaged from casing, a sectional ring fitting groove in outer end of casing and projecting beyond circumference of casing, a collar removably fitting outer end of valve having lower face grooved or channeled and corresponding with counterbore in outer end of casing and overhanging ring and a spiral spring surrounding valve having one end contacting with bottom of counterbore in casing and other against groove in valve collar, whereby valve is normally closed.

**PRECIPITANT FOR RECOVERING METALS FROM SOLUTIONS.**—No. 684,578; C. W. Merrill, Alameda, Cal.

A precipitant for recovering precious metals from cyanide solutions which consists of a combination of zinc and a gritty inert non-metallic material in a finely divided condition.

### The Atlas Tube Cleaner.

The Atlas tube cleaner is designed to run either by water or steam. The source of power, as shown in cut, is a miniature water wheel of the impact and turbine type D, connected to which is the power

The Atlas Tube Cleaner.

shaft F. At the end of the shaft is a toggle joint H, connecting the cutter shaft G, on the end of which is the cutter E, which removes the scale. The water enters at A into the chamber B B and through the port holes or nozzles C, striking the buckets of the impact and turbine wheel D, causing it to revolve at the rate of 4000 revolutions per minute under a pres-

sure of 100 pounds, and causes the cutter E through the toggle joint H to revolve in a gyrating and roweling motion, disintegrating and dislodging the scale, which is washed through the tube by the water passing through from the water wheel D. The tube cleaner is designed to work at any pressure from 60 to 150 pounds. The manufacturers say that from 100

to 120 pounds has been found to be the proper pressure to use for ordinary scale.

The Atlas tube cleaner is made and supplied by the Atlas Pipe Wrench Co., Flood building, San Francisco, Cal. They were awarded the first prize at the Buffalo Pan-American exhibition for both the Atlas pipe wrench and the Atlas tube cleaner.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

Three parties of the U. S. Geological Survey have returned from Alaska to Washington, D. C., where the maps and reports have been made. One party, led by T. G. Gardiner and A. J. Collier, surveyed the country north of Nome. A second, headed by W. J. Peters, made a reconnaissance of the country between the Koyukuk river and the Arctic coast at Point Barrow. The third party explored in the interior country bounded by the Koyukuk, Dall, Old Man and Kobuck rivers.

### JUNEAU.

The Treadwell Co., at Douglas, will make extensive additions to its plant during the coming winter. New compressors will be installed and many more air drills added to the equipment of the mines.

At the Alaska Perseverance M. Co.'s mine, near Juneau, Supt. Lonsberry states that the tunnel will be run in about 2500 feet and will crosscut the lode, giving from 1500 to 1800 feet of stoping ground. They will put in a compressor and air drills next spring, and possibly a mill.

At the Boston King quartz mine, near Juneau, J. Wagner manager, a tunnel 125 feet long has been completed and preparatory work done toward the erection of a 10-stamp mill in the spring. Work on the ledge will continue through the winter.

The Lemon Creek Co. have the hydraulic pipe in place on the placer mine ready for operation in the spring.

### NOME.

At the newly discovered Candle Creek district it is stated that only surface work has been done on most of the claims. It is stated that before the winter season is well on a camp of considerable size will be well established on Candle creek or the Keewauk river, of which it is a tributary. T. Noyes, formerly of Butte, Mont., has been appointed recorder of the new district.

### ARIZONA.

#### GILA COUNTY.

T. Crandall, Supt. of the Del Shay mine, on Tonto, near Globe, states that they have made the connection between two shafts 264 feet apart and 95 and 137 feet in depth. A large amount of ore has been blocked out that carries good values in gold, silver and copper, and the question under consideration is the method of treatment, which will be either concentration or smelting.

#### GRAHAM COUNTY.

The Shannon Co. at Clifton has completed 3 miles of railroad construction to the smelter, and expect to have their 500-ton reduction plant in operation by January 1. A 500-ton concentrator will be completed early next year. With the smelter running the company expects to produce 1,000,000 pounds of copper per month, and with the completion of the concentrator this will be increased to over 1,600,000 pounds per month. The company then expects to be in position to earn dividends with copper at 12 cents in New York.

#### MARICOPA COUNTY.

The Sahara claims near Wickenburg, on which the recent strike of native silver ore was made, has been bonded by the owners, Nickles, Brennenman & Miller, to R. Lloyd of Colorado Springs, Colo., at \$60,000, it is stated.

#### MOHAVE COUNTY.

The Yucca Cyanide M. & M. Co. are working on the San Francisco mine, Cedar valley, near Kingman. The shaft is down 237 feet; the face of the lower tunnel is in 320 feet and shows 2 feet of good ore. Water is coming in the shaft, and it is expected that within another 100 feet there will be sufficient obtained for milling. C. D. Pickering is manager.

The Kingman M. & Ex. Co. has sold the Railroad and other mining claims in the Gold Road country, near Chloride, to G. H. Hooper, who will go to work on it at once.

#### SANTA CRUZ COUNTY.

The Melba M. Co. are developing the Alta mine, near Harshaw. The Alta is an old mine, idle many years. A new hoist, boiler and gallows-frame and pump have just been installed and the shaft has been repaired and is being sunk from 150 feet to 300 feet depth. The ore is lead and silver and carries copper glance. R. L. Hammil is superintendent.

J. M. Manon of Washington camp, near Patagonia, says that on many outside claims of different companies the annual assessment work is being done.—The Duquesne Co. will do over \$6000 assessment work on claims they own or have

under option.—The Pride of the West Co. is installing their new machinery, which will increase the output from 50 to 200 tons daily.—On the Poole group a new steam hoist has been put up to sink with to considerable depth.

### YAVAPAI COUNTY.

E. L. Phelps, W. Field, B. Grove and P. D. Brown, of Cripple Creek, Colo., have bonded the Good Hope and Smugler mines near Prescott of J. Chambers. The price is \$10,000; time one year. The bonders expect to sink a shaft 200 feet below the level of the tunnel. The tunnel is in 500 feet.

The Jessie Mines Co. has been incorporated at Jerome to work the Little Jessie group of claims. J. S. Jones is president and H. Brisley secretary.

### CALIFORNIA.

#### AMADOR COUNTY.

The Central Eureka at Jackson has paid monthly dividends regularly for eight months. Six dividends were paid at the rate of 2½ cents per share, aggregating \$60,000, and two dividends at the rate of 2 cents per share, aggregating \$16,000, making a total of \$76,000. The shaft is down to a depth of 2000 feet and the mine opened to the 1850 level, from which ore is now being supplied to the mill. W. R. Thomas is Supt.

The drift from the 600-foot level of the Fremont has been run into the Gover mine, near Amador, and has developed a low-grade ore body 110 feet wide, which is claimed to be milling rock, estimated at between \$4 and \$5 per ton. It is reported that a 60-stamp mill will be erected in the spring.

At the Mitchell mine, near Pine Grove, the 10-stamp mill is kept running steadily. A new ore body has been opened on the 300-foot level, from which the mill is being supplied.

The Wildman-Mahoney mine, at Sutter Creek, has been sold to an Idaho company. The new company will sink the Mahoney shaft. The Wildman shaft is being repaired.

#### BUTTE COUNTY.

Two new gold dredgers are being constructed in South Thermalito, one just north of the Wills & Gable prune orchard, the other in the Briggs peach orchard. Both are of the Rison or Postlethwaite type.

#### CALAVERAS COUNTY.

Prospecting work preparatory to dredging in the Calaveras river at Jenny Lind is being done, and when completed dredgers will be built to work the ground.

The Emery M. Co. at El Dorado are putting their hydraulic mine in condition to start up for the season's run. Sixteen men are employed.

There are about 100 men employed by the Calaveras Water & M. Co. on the ditches to get in readiness for operation.

E. Rigney has seven men at El Dorado getting his hydraulic mine in shape for the winter's run.

P. Lancell continues to take out large quantities of nuggets from his recently discovered channel at Buckeye. A shaft has been started, but is not yet down to bedrock. It is reported that an offer of \$25,000 has been made for the property and declined by the owner.

G. Bauman of New York and P. L. Schuman are owners in the North Star mine, near Mokelumne Hill, and it is reported that they will soon begin the erection of buildings on the millsite for the 20-stamp mill that has been stored at the mine for some time. The North Star has a tunnel in 1700 feet, which is being re-timbered.

#### LOS ANGELES COUNTY.

It is reported that the Murphy Oil Co.'s oil properties at Whittier have been bought by an Eastern syndicate, the United States Steel Corporation. The object of buying it is said to be to obtain a fuel supply for a steel plant to be located at Los Angeles or vicinity on the completion of the Salt Lake Railroad, which will supply iron ore.

#### MONO COUNTY.

R. Doyle of Chicago, Ill., an owner of the Mammoth mines, at Mammoth, has made arrangements to take out a test mill run of ore with a view to reopening the mine.

#### NEVADA COUNTY.

A. D. West of Marysville, manager of the Diamond M. Co., operating near Washington in Diamond Creek mining district, says the property of the Diamond Co. is a tract of 210 acres on, he believes, the Omega channel. A tunnel has been run into the mountain 700 feet, reaching the gravel channel so that it can be drained and worked.

A new 20-stamp mill will be put up at the Yuba mine, near Maybert, to take the place of the old one now on the property. The Yuba mine now gives employment to about fifty men.

At the Gold Tunnel mine on Deer creek,

near Nevada City, a new building is being erected over the hoisting plant. Supt. E. Lawrence is rushing the underground work.

The mill for the Ensign mine, between Sweetland and Birchville, is being constructed. The company to work the Ensign was organized by Dr. Fouch of North San Juan.

The Gold Crown Con. G. M. Co., owning the Gold Crown, Examiner, Crown Point and Hornet mines at Omega, has equipped them with machinery consisting of a hoist, engine and boiler, the latter of power sufficient to run ten stamps. The development consists of a tunnel on the 3½-foot vein, opening a pay shoot 450 feet long, which will mill about \$15 per ton. A shaft is being sunk to open up levels at 180 and 280 feet.

The Pine Hill mine, at Wolf, is to be opened up and men have already been put to work. Mr. Milliken has resigned and C. Rosenthal has been selected to succeed him as Supt. by the New York syndicate which owns it. H. Thomas of Grass Valley has been appointed foreman. A new boiler has been ordered and a Cornish sinking pump will be put in. The company, Supt. Rosenthal states, intends to build a smelter near the mine. The Pine Hill ore is copper-bearing. A test of average ore, 400 pounds, it is said, returned \$17 gold and 11½ copper per ton. There is a double-compartment shaft now down 200 feet on the mine which is to be sunk to 1000 feet.

The Providence mine, at Nevada City, has been bonded by C. Heller of Los Angeles.

Work of reopening the Boss mine, near North San Juan, is to be commenced at once, San Francisco people now having control of the property. G. McCullough is Supt.

#### PLACER COUNTY.

At the Black Canyon mine, at Westville, the shaft is now down 200 feet. Supt. Pinkston is working three shifts.

The Pioneer quartz mine, at Damascus, will start up again as soon as there is sufficient water to provide power. Supt. Stone has already put some men on.

The Bob Lewis drift mine has started up again, H. M. Jarvis Supt. Buildings are being put up for the winter, and two power drills are working in the tunnel. They expect to break through into the channel about January.

At the Rawhide mine, near Emigrant Gap, a dam and 4000 feet of flume have been put up, providing water power. Ten men are being worked under Supt. J. K. Patrick.

The Bellevue people propose sinking a new shaft on their mine near Ophir. A steam hoist will be put in.

The 20-stamp mill is nearly completed at the Three Stars mine, at Ophir.

#### SHASTA COUNTY.

An Eastern company is negotiating to buy the Quartz Hill mine, near Redding, for, it is reported, \$65,000. The mine has been idle for over five years.

#### SIERRA COUNTY.

Morse Bros. have completed the construction of a reservoir at the Hilo mine, near Downville. The reservoir consists of a reservoir 450 feet in length and required about 3000 tons of earth in its construction. It took about six weeks to finish the work, and they made good wages on the contract.

J. W. Finney has bought the controlling stock interest in the Oxford mine, formerly the Good Hope, situated near Downville. It is intended to reopen the mine.

The California Debris Commission has received an application to mine by hydraulic process from G. F. Edwards in the Philo Haven placer mine, near Gold lake, to deposit tailings in Mud lake.

#### SISKIYOU COUNTY.

G. W. Trefren, manager of the Siskiyou copper mine, reports that the quartz vein recently struck on this mine assays \$150 to the ton from croppings that can be traced for several hundred feet.

At H. E. Espey's mine on Beaver creek a ditch is being cut from Soda creek and Snake creek to unite with the Patterson ditch. A contract has been let to extend the Patterson ditch at \$2 per rod. This mine is owned by a Seattle syndicate who are represented by Mr. Espey as manager.

The Adelaide is at the foot of Sterling mountain, at the junction of Grouse and Beaver creeks, and has been worked in by W. A. Montgomery for the past eight years. During the present summer he succeeded in locating the old channel bed. The dirt will average \$4 to the cubic yard and there is some heavy, rough gold that carries quartz.

The Siskiyou placer mine, near Happy Camp, is to be started up again this fall, and preparations are now being made.

C. C. Webb of Montague has interested San Francisco people in a proposition to build a 20-foot dam in Shasta river, near

Montague, which will give a head of 16 feet, for a power plant to operate mills and factories. Timbers for the dam are being put on the ground. The company expect to put \$25,000 to \$30,000 in the enterprise.

E. H. Scott, Supt. Con. M. & Dredging Co., operating at Callahan, states that the machinery will soon all be in place and they hope to start up by the first of the year.

J. W. Coyle and S. Smith have struck a rich ledge in Bushy gulch, near Hornbrook, and are arranging for a sampler run of ten tons of ore at the LaFlesh mill at Henley.

### TRINITY COUNTY.

The pipe camp of the Sweepstake M. Co. on Oregon mountain, near Weaver-ville, employs forty-five men under Supt. B. Glatz of the Francis Smith Co. of San Francisco. Eight miles of 30-inch pipe has been made. The pipe is made from Nos. 7 and 14 sheet iron, and of the latter number the men are now making a mile a week. The force will work until the snow comes and then operations will be suspended until spring.

### TUOLUMNE COUNTY.

Work on the Crystalline mine, near Rawhide, is being pushed by A. C. Morrison, the manager. A new double drum 13x16 hoist, which can work the mine to a depth of over 1500 feet; a duplex compressor to run six baby drills; two horizontal tubular boilers, weighing about 30,000 pounds, together with a Brownell heater and purifier 36 inches in diameter and 9 feet high, are to be installed. The present hoist will be removed to the old shaft, which will be unwatered. This will necessitate the erection of two large gallows-frames. A three-compartment shaft is to be sunk to the 600-foot level.

The Campo Seco M. Co., which is to operate on the Eberhardt ranch, near Jamestown, has been organized in San Francisco with H. A. Crane as president and S. Solomon as secretary. F. Federici is the superintendent of the company. It is announced that a three-compartment shaft is to be sunk.

The Dead Horse mine, near Groveland, has been bonded to C. Y. DeLay, and operations are to be commenced and sinking machinery installed.

The hoisting machinery at the High Point mine, at Stent, is being moved to Rawhide, and is to be set up at the Rawhide Extension mine, formerly the Mount Hood.

In the Rawhide mine, at Rawhide, at a depth of 20 feet in a winze being sunk from the 1800-foot level, they have found an ore body 18 feet wide that assays \$19.25 to the ton.

At the Eagle-Shawmut mine the mill was shut down on the 11th inst. It is being cleaned up and repaired. The overhauling will be finished in time to start up again about November 1st. The capacity of the chlorination plant is being doubled. In the mine work goes on uninterruptedly.

The Marion quartz mine, near Columbia, has been sold to A. R. Otter by C. Thrasher.

Bluett & Gillis are operating the Lantissama mine, near Tuttle town, and have 200 tons of ore on the dump. The hoist, compressor and pump are run by a gasoline engine.

The Little Beauty quartz mine, near Arrastraville, has been bonded by F. C. Cullers at \$9000 to G. E. Joninon, R. Plummer, T. Ryan and L. Wiseman, who have commenced development work and will continue the lower tunnel 100 feet.

The Stockton Smelting Co. has been incorporated with its office at Stockton, capital \$100,000, to build a smelter at Jamestown which will have five ovens, capacity thirty tons a day. The incorporators are C. C. Franklin, C. F. Babcock, W. A. Morris, P. J. Wallace and others, all of Stockton.

### YUBA COUNTY.

U. S. District Attorney Woodworth, under instructions from the Attorney General at Washington, has begun an action in the U. S. Circuit Court at San Francisco, against J. O'Brien of Smartsville, this county, to compel O'Brien to execute a conveyance of the lands he had previously given an option on at \$2500 to the U. S. Debris Commission. The complaint also prays for \$1000 damages sustained by O'Brien's refusal to live up to the terms of the contract.

### COLORADO.

#### BOULDER COUNTY.

The Black Swan M. & M. Co., owners of the Black Swan, Mountain View, Atchison and Sunshine claims at Wall Street, are, in conjunction with Eastern capital, erecting a new cyanide mill adjoining the mines, to be completed about the first of the year and to have a capacity of thirty tons per day. The erection of the mill is being superintended by W. H. Nichols.

The Iowa M. & M. Co., recently organ-

ized by Sioux Falls, S. D., people, will operate the Rowell property, consisting of the McCarty lode claim, considerable placer ground and some timber land, near Eldora. A shaft on the McCarty is to be sunk 100 feet and if it develops into a milling proposition it is the intention to build a small mill and treat their own ore. J. Rowell is Supt.

#### CLEAR CREEK COUNTY.

(Special Correspondence).—The Franklin Con. M. Co. was recently organized to operate the Franklin and Silver Age mines, and the Wilkie and Silver Age mills, all at Idaho Springs. A new compressor plant and water wheel will be put in. A. F. Bain is the manager. A lateral is being driven from the Newhouse tunnel to the Gem—1000 feet. When this is completed the Franklin proposes to continue the lateral on into their grounds.

The Newhouse tunnel, now in nearly 15,000 feet, first cuts the Gem and Gem Extension ledge, and farther on the Sun & Moon, Star, Bertha and Adducille in the order named. The first two veins are in Clear Creek county, the last three in Gilpin county. The Sun & Moon vein is cut about 2200 feet below the surface by this tunnel. Shipments amounting to a considerable tonnage are being made from the tunnel level of the properties named. The tunnel has double track, the cars being drawn by mule power, but it is expected to have electric locomotives doing the work within a few weeks.

The Gem, Gem Extension and Main Trunk are on the same vein and under the management of W. E. Renshaw. The main shipments from the group are being made from the Gem Extension shaft, which sinks 700 feet from the surface, though forty railroad cars of ore have been taken from the lower workings through the Newhouse tunnel. The Newhouse mill at Idaho Springs is supplied with ore mainly from this group. The workings from the tunnel level are over 1200 feet lower than the base of the Gem Extension shaft. Work on this group is progressing from the tunnel both east and west on the main vein. Two drifts are run westward on the Main Trunk—one 200 feet along the hanging wall and another 250 feet on the foot wall, the two being over 40 feet apart. A slope 75 feet high also extends along the hanging wall. The ore exposed next to the foot wall appears to be 7 to 9 feet wide and that on the hanging wall 3 to 7 feet wide. It comprised an iron and copper sulphide, with gold and silver values, although the copper is of some importance. The work east of the tunnel, on the Gem and Gem Extension, consists of a 180-foot drift along the foot wall and one of 75 feet next to the hanging wall. In one place it is 74 feet between walls. It is stated that the Gem vein is wider at this level than it is in the upper workings. The gangue rock on the tunnel level comprises a quartz, lime and porphyry. It is said the ores in the upper workings ran 1½% to 6% copper and in the lower workings about 1½%. When the Gem vein was first crosscut by the Newhouse tunnel a small body of steel galena was found, but it was soon worked out, though it is believed to extend below this level.

The Sun & Moon drifts from this tunnel extend 300 feet on each side of it. This group has two veins, both crosscut by the tunnel. Shipments from this property amount to 700 tons of ore per month. Of this 600 tons are concentrated at the Roberts mill, the other 100 tons going direct to the smelter.

The Lucania tunnel is a new project, at the head of which is Rees C. Vidler of Colorado Springs. The tunnel starts at the foot of Champion mountain, on Fall river, and is to cut northeasterly through Champion mountain and into Quartz hill, above Central City, striking the veins of the latter over 2000 feet below the surface. The company behind the project has secured thirty-eight claims along the tunnel's course.

The Roberts mill, which is confined strictly to custom work, runs an average of fifty tons of ore daily and operates continuously. Crushers, rolls, Huntington's, jigs, slime table, buddle and other tables are used. The Roberts slime table, illustrated in this paper of September 28, is in use and is an interesting machine.

Idaho Springs, Oct. 19. WASCOTT.

(Special Correspondence).—Lawson is on Clear creek, the second station below Georgetown. On the south side, about 1200 feet higher than Clear creek bed, is Silver Creek, noted as the location of the Jo Reynolds group, whose record as a producer is a part of the early history of the county. The Jo Reynolds workings, from the surface, are about 700 feet deep, in which operations are not being pushed at present. The group belongs now to Mr. Morton, whose son, R. B. Morton, is in charge. To drain the old workings and afford cheaper transit of ore to the railroad a tunnel is being driven from a point near the town, which is now in 1500 feet.

It will cut 180 feet below the old workings and open up some virgin ground.

On the opposite side of Clear creek, on Red Elephant mountain, are the Tabor, Schwartz, Young America, St. John, Free America, White and others. All these are under bond and lease and other control of P. R. Stanhope and associates, who have started the Tabor tunnel, with the purpose of draining these properties and aiding in further development. The mines are opened by shafts from the surface and were formerly producers. The Schwartz shaft is said to be 700 feet deep, extending below the level of Clear creek. The ores of this mountain are mainly silver and lead, with fair gold values. The tunnel now being driven will cut some of the veins as deep as 1000 feet. The power plant for this work consists of a 35 H. P. gasoline engine, which operates a 30 H. P. electric generator. The latter operates a motor in the tunnel, driving electric drills.

Lawson, Oct. 19.

#### GRAND COUNTY.

A company has been organized which proposes to supply Clear Creek county with electricity to be produced by water power. A reservoir is to be built at the junction of the Grand and Frazier rivers, near Hot Sulphur Springs, to cost about \$500,000. E. A. Lee is the engineer. State Engineer A. J. McCune has approved the plans. The dam will be 570 feet long, 75 feet high, and will form a lake 2100 acres in area. A flume will be run 9 miles down the river to secure 250 feet head for the power.

#### LAKE COUNTY.

(Special Correspondence).—The A. M. & W. mill is handling about ninety tons of zinc-lead ore from the 600 and 750-foot levels, which is hoisted through the old Adams shaft. The product of the mill amounts to about seventy-eight tons concentrate, being sixty tons zinc and eighteen tons lead. A small per cent of iron—not over 10%—is also saved, mostly with the lead. The lead concentrate does not carry more than ½ of 1% silica, the zinc concentrate about 2½ to 3½ silica. The ore is crushed by Huntington grinders to forty mesh and is sized by hydraulic settlers for the two sets of tables which make the separation.

The Denver City mine, on Fryer hill, under lease to Kuhn, Lindsay, Esco, Standy and Swartout, has begun shipping about fifty tons daily from the workings of the 315-foot shaft. Good silver values in an iron ore are obtained.

Leadville, Oct. 16.

A strike has been made in the White Cap mine, at Leadville, operated by the Nayr M. Co., under the management of J. Shinn. The company has been working for a year on a lease deepening the shaft from 500 feet to 700 feet. On a drift from the bottom the strike has been made of ore sampling 50% lead, 15 ounces silver and .06 of an ounce gold. Chicago and Denver men own large interests in the company.

#### PARK COUNTY.

Two smelter plans are said to be progressing which have in view the erection of smelting plants in the Alma district. One of these, it is said, will be built at Alma, while the other may be built in Buckskin gulch or at the junction of the Colorado & Southern.

#### SUMMIT COUNTY.

(Special Correspondence).—The Augusta M. & Co., T. R. Griffith manager, are driving a 1000-foot tunnel from French gulch into Farncom hill. The breast is now at a point 790 feet from the entrance. It is expected to cut the Juventa vein 250 feet farther ahead at a depth of 560 feet below the surface, and 370 feet below the old workings. From the latter large shipments were made from 1890 to 1895, much of which yielded a net return of \$17 per ton, the values being mainly silver. These shipments were mostly from the first level up. Very little of the ore between the first and second is stoped out. It is claimed the mill ore on the dump amounts to 10,000 tons. At the tunnel entrance is an air compressor, electrically operated. The tunnel heading is advanced 3 feet a day.

Breckenridge, Oct. 17.

#### TELLER COUNTY.

A new strike of gold ore has been made in the Elkton mine at Cripple Creek. Drifting at the 700-foot level, 100 feet from the main shaft, a vein 5 feet wide of fluorspar and talc has been opened with neither wall shown. The vein matter, it is reported, glitters with sylvanite and gold. The vein surrounds a large open chimney 30 feet in diameter in which is a lake of unknown depth. The ore, when brought to the surface, showed a blue color. It is of the consistency of dough, showing grains of metal like sand in mortar.

Stratton's Independence has put in operation its new plant of machinery. The

plant cost about \$40,000 and will hoist from a depth of over 3000 feet. In making the change no time was lost, the new galloways-frame being built around the old one. The output of the mine for October will be about 8500 tons, averaging about \$37 a ton. The main shaft is down 1330 feet.

#### IDAHO.

##### BEAR LAKE COUNTY.

T. Moore of Montpelier reports that a strike of very rich copper ore has been made in Montpelier canyon, 10 miles east of Montpelier. J. Oberly is owner.

##### IDAHO COUNTY.

The Northern Star Co., of which W. H. Plummer of Spokane is manager, expects to erect a 5-stamp mill upon its property near Dixie.

A 10-stamp mill is being built for the Wise Boy mine at Buffalo Hump, and will be taken in over the snow to the mine and put in operation. The mine is owned by A. W. Moore and son. A sawmill plant is to be put up to cut lumber and timbers to be used in the mine and for the mill building. The stamp mill consists of two 5-stamp batteries of 950-pound stamps, a concentrator, a tramway and a 35 H. P. engine and boiler.

J. D. Glover of St. Paul has bought a half interest in the Gold Bug and Columbia properties. The claims were owned by a Lewiston company, consisting of C. H. Harding, C. W. Colby, D. Trullinger, J. Nielson and others. The Gold Bug-Columbia M. Co. has been incorporated, with J. D. Glover as president. A contract has been let for 450 feet of work on the Gold Bug claim and operations will be actively pushed through the winter.

##### OWYHEE COUNTY.

The tunnel under War Eagle mountain is now practically 1 mile in length, with the face of the tunnel approximately 1800 feet below the surface. Thus far four ledges have been cut, but no commercial values obtained. The tunnel is being pushed on for the Chariot ledge.

##### LEMHI COUNTY.

C. G. Goss and associates have located a number of claims adjoining the Blackbird group, near Salmon City, and have had assays which gave as high as 8% nickel, 24% copper, \$2.20 gold and 1.88% cobalt. The Blackbird, owned by P. A. H. Franklin of Salt Lake City, yields ore that averages \$9 gold and 10% copper. P. M. McCree, formerly of the Bingham Con. mines at Bingham, Utah, is Supt. of the Blackbird mines.

##### SHOSHONE COUNTY.

(Special Correspondence).—The Snow Storm M. Co. of this place have cut the ledge at a depth of 540 feet, and now have 40 feet carbonate, copper ore, in a quartzite gangue. The ore will average 50% copper and 7.2 ounces silver.

Mullan, Oct. 20.

#### MICHIGAN.

##### HOUGHTON COUNTY.

At the Old Colony mine, at Houghton, a vertical shaft will be started at once to exploit the lodes shown up by the diamond drill.

On the Mayflower a new lode has been discovered by a miner who was chopping a stump for kindling at the edge of a hill. Feeling something under his feet, he investigated and found that it was a horn of copper. Clearing away the leaves and surface rubbish, the miner discovered a well defined lode. The mining captain was informed, a shot was put in and heavy rock, heavily charged with copper, was thrown out. The lode is 15 feet wide.

#### MONTANA.

##### CASCADE COUNTY.

The Boston & Montana Co. is planning to build another electrolytic refinery at Great Falls. The refinery will be located near Rainbow Falls, on the Missouri river. It is expected that construction will begin immediately.

##### DEER LODGE COUNTY.

T. Hird, T. Garrison, M. A. Mitchell and D. P. Bagnell of Spokane, Wash., and associates have bonded the Ophir mine, near Marysville, Mont., to W. A. Clark of Butte. T. Hird has been appointed superintendent. A plant will be erected and a two-compartment shaft will be sunk to the 300-foot level. The ledge is 50 feet wide and carries copper in ores similar to those of Butte. There is a 20-foot body of concentrating ore and a 2-foot streak of rich ore that will run from 12% to 18% in copper and from \$3 to \$6 in gold, with small silver values.

##### FERGUS COUNTY.

It is reported that \$100,000 has been offered by the American Gem M. Co., interested in which are C. D. McClure and P. A. Fusz of St. Louis, Mo., L. S. McClure of Los Angeles, Cal., and D. Jan-kower of Helena, for the sapphire ground

owned by the New Mines Co. at Yogo. The American Gem Mining Syndicate, with this ground, will then control the entire Yogo field. The American Syndicate also own a large group of claims on Rock creek, Missoula county, and, it is believed, intend to monopolize the mining of sapphires in the United States.

#### GALLATIN COUNTY.

A rich discovery is reported made near Red Rock lake, at a place now known as Dwelle City. The new camp has already about 300 inhabitants. There are said to be rich quartz as well as placer claims, and one assay from quartz showed twenty-two ounces in silver and \$45 in gold.

#### JEFFERSON COUNTY.

N. W. Pierson has leased the Miner mine, at Wickes. The Miner has been a large producer of gold and silver. There is a stamp mill that cost close to \$200,000.

#### LEWIS AND CLARKE COUNTY.

A strike of \$150 a ton ore is reported made in the Big Ox mine, near Marysville. C. J. Fulton is manager.

#### SILVER BOW COUNTY.

The Butte & Arizona C. M. Co. has bonded some property about 2½ miles southwest of Butte. One shaft has been sunk about 50 feet to water level, and another is being sunk to have machinery put in by the time water is struck there.

#### SWEET GRASS COUNTY.

W. H. Trowbridge of the Deer Creek M. & Dev. Co. states that the company has claims on Deer creek, out from Big Timber. The Custer lode, he says, is about 32 feet wide, the Dickson lode 12 feet wide. The ore is galena and assays \$26 a ton.

#### NEVADA.

##### HUMBOLDT COUNTY.

R. Battels of Golconda says that operations will probably be resumed in the mine and smelter of the Glasgow & Western Co. very soon. The Salt Lake office has ordered the water pumped from the mine's lowest workings. Since the shut-down a year ago the pump has been kept running to prevent the water rising above the 200 level.

##### LYON COUNTY.

The Ducktown M. Co. has been incorporated at Reno; directors, J. W. Hutchinson, Wm. Still and Geo. W. Callihan of Reno; A. W. Wilson of Joplin, Mo.; and F. C. Everett of Delphi. The company has bought and is developing the Ducktown claim, a south extension of the Ludwig copper mine, in Mason Valley.

##### NYE COUNTY.

(Special Correspondence).—The G. & H. Tunnel claims, owned by T. L. Oddie, R. Gordan, A. L. Hudgen, P. Manning and Brougher Bros., is at the south end of Oddie mountain, east of and adjoining the original Tonopah claims of the Tonopah M. Co. The tunnel is in 250 feet, with a 70-foot air shaft. The tunnel is headed for the extensions of the Mizpah and Burro ledges of the Tonopah M. Co.

Ore has been struck at 85 feet depth on the Cabin shaft of the Salt Lake Co., south of Tonopah and near the Valley View ledge. The character of the ore is similar to that in the Tonopah mines and values obtained are encouraging.

Butler, Oct. 15.

G. W. I.

##### WASHOE COUNTY.

The Senator G. M. Co., at Steamboat, is sinking its double compartment shaft at a rate of 4 feet a day. Water flowing in about three gallons per minute has been struck; it is quite warm, but not hot enough to impede working. No difficulty has yet been experienced in handling the flow. The shaft is still in sedimentary formation, but there is considerable pulverized quartz.

Mr. Bidwell of the Norton & Bidwell mine at Pyramid states that work is being done in a large ledge carrying \$120 per ton. An inclined shaft is down 90 feet. In some places the ledge is 18 feet wide. The values are in gold and silver and the ore is free milling. The company expects to erect a mill in the spring.

C. B. Bell, T. Dougherty, J. S. Miller and V. Bony of Reno have leased for three years from R. L. Fulton, for mining purposes, one-half of section 30, township 20 north, range 20 east, M. D. M., near Reno. The lease is to run for three years. A company will be organized to prospect this ground.

#### NEW MEXICO.

##### SOCORRO COUNTY.

The Silver Bar Copper Co., owning the Cooney mine at the Mogollons, has paid a third dividend of 6%, the former two being 3% each. The main shaft is down 325 feet; the producing vein is 15 feet wide and averages 15% copper across the entire vein. It is controlled by Colorado Springs people.

##### TAOS COUNTY.

H. H. Hankins is taking machinery to the Copper King mines, at Red River

City, and when it is all placed the company will begin extensive operations.—The Golden Treasure, at Red River, is again running, after a shut down. Manager Davis has been granted a lease for another year.

#### OREGON.

##### BAKER COUNTY.

J. W. Carr, president and manager of the Quebec mine, near Alamo, reports the first cleanup of the new 10-stamp mill for a fifteen-days run as \$14,000.

Mr. H. Longstaff, of Troy, N. Y., representing New York people, has bought the Carpenter Hill and Never Sweat claims of Hackett Bros., F. Andre and R. Hennessey for, it is said, \$11,000. The former owners have been doing development work on the mine for three years, working the ore in an arrastra. It is announced that the new owners will put up a 10-stamp mill and operate on a much larger scale.

W. E. Hurd, of Portland, manager of the Chelan group at Alamo, says the mine has a 20-foot vein that assays in parts as high as \$20. He is driving a tunnel which is now in 450 feet, giving "backs" of about 220 feet. This work is being done under contract.

The title to the Sturgill Bar placer mine, on Snake river, is in dispute. This is a placer claim that has been worked for years by M. Robinette and C. D. Reed. Recently some sheepmen have filed on the ground embraced in this claim as a home-stead entry, alleging that it is not mineral land. A contest will soon come before the local Land Office to determine the character of the land.

The Phoenix mine, in the Greenhorn district, near Baker City, has been sold for \$80,000 by W. C. Cowgill, C. C. Nipple and L. Y. Kadey of Baker City and F. S. Alexander of Spokane to an Eastern syndicate represented by W. R. Crawford, trustee, and C. Parker, E. M., of London. The new owners have, it is said, already ordered a 10-stamp mill. Considerable development work has been done, and there is claimed to be 3000 tons of milling ore on the dump. It is said the assay value of the ore on the upper levels averages \$10 to \$20 to the ton, while that on the lower workings goes as high as \$70 to \$100 per ton.

##### JACKSON COUNTY.

At the Ashland mine, at Ashland, the double-compartment shaft is down 770 feet and sinking on the ledge continues. The ledge, it is said, holds its size of 7 to 8 feet in thickness, and there is no diminution of the ore. Drifting is being done at the 700-foot level, and ore is being stoped at all the levels. The gold now runs about \$14.50 per ounce, the reduced value being due to the presence of silver.

The Rock Bowers' placer mine near Gold Hill have been sold to J. H. Bagley of Marshall county, Iowa. Mr. Bagley has secured options on other placer properties in that vicinity and bought water rights to provide water for continuous work. He will install two hydraulic giants and a complete plant.

##### JOSEPHINE COUNTY.

Manager St. John of the Rising Star, near Grants Pass, is arranging to add five stamps to the mill of his mine.

The Gold King ledge, a new proposition, near Grants Pass, has been sold by E. M. Mead to a Mr. Burk of San Francisco for, it is reported, \$13,000. The ledge was prospected by an 180-foot tunnel, exposing a 4-foot vein of free milling ore. Mr. Burk will put in a 10-stamp mill at once.

The Sunbeam mine, near Grants Pass, has been bonded to S. R. Burke of Tacoma, Wash., at \$11,500 for nine months. The mine has considerable development, there being a shaft 140 feet deep and a tunnel 70 feet long. Work will be begun at once upon the tunnel.

#### UTAH.

##### BEAVER COUNTY.

Dedmachy & Sellers, of Paris, France, have sold to S. Newhouse, of Denver, Colo., the Cactus group of mines near Frisco for \$200,000. Mr. Newhouse states that fully \$1,000,000 would be spent in the equipment of these mines. A concentrating mill of large capacity will be built at the mines, and a smelter, with a capacity of at least 500 tons a day, will be erected in the vicinity of Salt Lake City.

##### JUAB COUNTY.

The Madeleine M. Co., owning the Sunnyside and the Melinda lode claims near Tintic, has been incorporated; capital, \$25,000. J. B. Caldwell is president and W. F. Smith secretary and treasurer.

##### PARK COUNTY.

At the annual meeting of the Creole M. Co., R. J. Evans president, W. H. Ray treasurer and J. M. Lockhart secretary, it was decided to resume work on the mine, which is located at Park City.

##### SALT LAKE COUNTY.

The Stockton Queer M Co has been

incorporated, capital \$500,000, to operate the Copper Queen Amendment, Copper Queen Nos. 2, 3 and 4 and Bellevue, in the Rush Valley mining district. W. A. Morey is president and F. E. Arnold secretary and treasurer.

##### SUMMIT COUNTY.

Stoping has been commenced at the mine of the Comstock M. Co., at Park City. The main level and the stoping ground overlying it has been drained, and the ores can be handled without paying for the transportation of moisture. Manager Hickey is now drifting from three stations on the upraise, with all of them in ore.

##### UINTAH COUNTY.

The Thayne's Canyon Con. M. Co. has been incorporated by M. J. Hall, B. E. Hartwell, J. J. Thomas, F. Knox, all of Park City, and P. A. Simpkin of Salt Lake. Office of the company will be at Park City. F. Knox is president; M. J. Hall, vice-president and superintendent; B. E. Hartwell, secretary and treasurer. Twenty-two mining claims in the Uintah mining district, valued at \$125,000, are the property of the corporation.

##### WASHINGTON COUNTY.

A. E. Vandercook of San Francisco, B. Hastings of Arizona and J. B. Hall have prepared plans for a leaching plant with which to treat the Barbee & Walker tailings at St. George. Vandercook & Hastings have taken a bond on the tailings from the old Leeds mill, on a royalty basis of 50 cents per ton, the bonders agreeing to handle not less than 600 tons per month and to have their plant ready within ninety days. J. Kempe of California, who located the tailings as placer ground, was the seller. The same people have also bonded the Christy tailings from R. C. Lund. It is estimated that this mill alone has 218,000 tons. If the option is taken up, there will be in all four plants erected near St. George, with a total capacity of 100 tons per day.

#### WASHINGTON.

##### FERRY COUNTY.

The new town of Ferguson, on Trout creek, north of Republic, has ten frame houses and several tents, three saloons, a boarding house, a clothing store, a lodging house and a restaurant. At the town are three railroad camps and the engineers' camp of the Republic-Kettle River road. Near the town there are numerous large and well defined copper veins. E. Kelley & Co. have the Cache group, working a large number of men, and expect to be prepared to ship ore by the first of May. There are several other properties that show copper ores.

##### STEVENS COUNTY.

I. W. Anderson of Philadelphia represents Philadelphia people who own the Silver Butte, Great Western, Pennsylvania and the Philadelphia mines, near Northport, and has been examining the mine with a view to starting up again.

##### SKYKOMISH COUNTY.

J. R. Kendall, J. S. Ecker and G. C. Walker of San Francisco have bought of J. C. Quinlaven twenty-three claims on Red mountain, near Skykomish, which are rich in gold-bearing quartz. The price is stated to be \$40,000. The buyers have organized the Kendall Red Mountain M. & Dev. Co. to operate the mines and utilize a water power.

#### WYOMING.

##### ALBANY COUNTY.

A. F. Whitman, discoverer and owner of the vein of asbestos near Dover, shows samples of the asbestos with a long fiber and texture as smooth as silk, making the material very valuable for manufacturing purposes.

##### CARBON COUNTY.

B. McCaffrey of Cheyenne says that his company, of which W. G. Emerson of Denver is a member, intended to consolidate the paying mines in the southern Carbon country and connect them with the smelter at Grand Encampment by an electric railway system. The trolley system will, it is estimated, cost \$3,000,000 to construct.

A. Bragg has been given \$35,000 for an option on his P. & T. mine near Rambler. A large lead of white iron and two cross leads of heavy copper carbonates have been found.

#### THE PHILIPPINES.

What is claimed to be the first real mining deal, involving claims staked by American prospectors, has just been closed in Manila. J. D. Morgan, representing San Francisco people, has bought the "Utah" group of claims, on the Butuan river, owned by P. Imes and associates; the "Antimoke" group, owned by H. C. Gilde and others, and several single claims, owned by Robinson, Grey, Roper and another, all located on the south fork the Butuan river. The highest price

paid for a single claim was \$80,000 to Robinson, but more was paid for groups. In all \$250,000 was paid. There were twenty-five claims in all, twelve located under the Spanish laws and measure about 950 feet by 600 feet, while thirteen were located under the mining laws of the U. S. and are 1500 feet by 600. All of the claims have some development work. One, in the "Utah" group, has a 60-foot tunnel in ore, which runs from \$10 to \$12 gold to the ton. Headquarters for the mines will be at Bagulo, in Benguet Province.

Army officers at Washington, D. C., who have recently returned from Mindanao say that the valleys of the river Sita and its tributaries, with a total length of 200 or 300 miles, are gold-bearing. The natives with rude washing implements are said to clean up from 50 cents to \$3 worth of gold in a day. The officers have brought back specimens of this gold and report that, according to the natives, it is found all through the valleys, which range from 5 to 20 miles in width. They say no American miners have as yet gone into the region.

#### FOREIGN.

##### BRITISH COLUMBIA.

It is reported from Horse Fly, in Cariboo district, that rich placer ground has been struck near the headwaters of Horse Fly creek, in a section where no white men have ever explored before.

The nickel ore on Wild Horse creek, near Fort Steele, is silver-gray in color and carries arsenic and antimony. It is understood that the work done on the Grace Dore ledge has uncovered the ledge for about 40 feet.

J. Breen, D. Fotheringham and H. Bellinger, Supt. Heinz smelters at Butte, Mont., have completed plans for building a 300-ton smelter on the east coast of Vancouver island, 40 miles north of Victoria. Two stacks will be constructed at the start, and plans will be made for increasing the capacity as the ore supply increases. H. Bellinger will be manager. Work will be commenced at once.

A strike has been made in the Aurora mine, near Moyie. A shaft being sunk on the ore body shows the vein widened out to 7 feet of solid galena. The mine is owned by Rader, Sanborn & Johnson.

A strike has been made at the head of Springer creek, in the Slokan, on the Monterey group, owned by N. F. McNaught, R. Milloy and L. Doiron. The discovery, made in an open cut, consists of a 6-foot ledge, carrying two pay streaks, 4 and 8 inches wide. The smaller streak assays from 410 to 500 ounces silver and the larger 80 ounces silver to the ton.

The tunnel on the Tammany group in the Burnt Basin, near Grand Forks, has crossed a blind ledge 9 feet wide. The ore is free milling. Development work is in charge of B. Rea. The Tammany group is owned by Saginaw, Mich., men.

S. H. Miner, president of the Granby Con. M. & S. Co., is reported as stating that the company is adopting what is known as the caveing system, which hitherto has not been applied to copper mining, but which is the method used in iron mining in Michigan and Minnesota. By means of large open cuts in a mountain of ore the latter is broken down and loaded upon the cars with steam shovels, obviating all timbering and pumping, and reducing to a minimum the cost of handling the whole mass. He claims that the company's smelting plant is treating ores at less cost than any other smelting plant in the world and anticipates beating its present record by at least 25%, with a more complete equipment and with the increased quantity of ore handled.

A record run for a single-blast furnace has been made at Greenwood, where the plant put through 484 tons during twenty-four hours. Of this amount 432 tons was ore and the balance coke. The furnace of the British Columbia Copper Co. was built with a nominal capacity to treat 225 tons daily; but, owing to the self-fluxing character of the ore, the daily average comes nearer 390 tons. P. Johnson, the manager of the smelter department, believes that the run establishes a world's record in blast-furnace work.

##### CHILI.

A shipment of silver ore from Chili has been received at the Pueblo smelter. It is one of the largest cargoes of silver ore recorded, being in 58,095 sacks, which required 215 cars to transport from Galveston, Tex., to Pueblo, Colo. There were 4800 tons, and the duty was \$30 a ton. The ore ran \$700 to the ton. The railroad freight charges were \$60,000.

##### KLONDIKE.

There have been heavy demands for mining machinery on the claims this summer. New lines of railroad are projected from Dawson to open up the country lying between Indian river and Quartz creek. All of the streams in this vicinity are said to be extremely rich.

#### MEXICO.

In September there were smelted at the Greene Con. Copper Co.'s mines at La Cananea, Sonora, 24,880,000 pounds of ore, producing 3,834,000 pounds of matte, containing 1,860,000 pounds copper. The average price received for copper sold during the month was 15.87 cents. New smelters will be blown in during October, which will increase the daily capacity 300 tons per day. The railroad is now operated to Villa Verde and all coke and other supplies are being shipped there by rail. The broad gauge railroad is expected to be completed to the mines about Nov. 25.

#### Personal.

J. ROSS, JR., of Sutter Creek, Cal., is looking at mines in Trinity county, Cal.

F. EDISON has resigned as Supt. of the West Century M. Co. at Park Valley, Utah.

T. W. FOSTER, M. E., late of Redding, Shasta Co., Cal., is sojourning in San Francisco.

W. V. MILLER has resigned as superintendent of the California Ophir mine at Angels, Cal.

J. RALPH, of Butte, Mont., has been appointed manager of the Oro Fino M. Co. near Prescott, Ariz.

F. T. CALEY has been elected manager of the Atlantic Mines Co., operating at Cripple Creek, Colo.

E. A. DE HAVEN, superintendent of the Wild Cat mine, near Carters, Tuolumne county, is in San Francisco.

J. A. KIRBY, manager of the Daly-West mine at Park City, Utah, has returned there from Tonopah, Nev.

H. A. KELLER, manager of the Trinity Copper Co., at Redding, Cal., has returned there from Boston, Mass.

JERRY LYNCH has returned to San Francisco, Cal., from the Klondike, where he has been mining for several years.

C. W. GOODELL, manager of the Great Falls smelter of the Boston & Montana Co., at Butte, Mont., is in Clifton, Ariz.

L. C. MOTT has been appointed Supt. of the Pinal Copper Co. at Globe, Ariz. G. P. Andrews, manager of this company, will make his headquarters at St. Louis.

F. T. SNYDER, E. M., of Chicago, Ill., is sojourning in San Francisco, coming here from a professional trip in Athabaska river country, Canada.

H. C. HOOVER, M. E., is in San Francisco, Cal., en route to England from China, where he has been engaged for three years examining the gold and coal deposits of that country.

#### Catalogues Received.

THE Sullivan Machinery Co. of Chicago, Ill., has issued Catalogue No. 47 advance sheets, illustrative and descriptive of the Sullivan air compressors. It is a dozen or so attractively printed and illustrated pages, giving details and dimensions of some of their compressors, together with data to assist a mine manager in estimating on his requirements. It will be mailed on application to the Sullivan Machinery Co., 1170 West Lake St., Chicago, Ill.

Pay Cash for Mill Wastes, Iron Amalgam Chips, Gold and Silver Retorts, Old and Surplus Quicksilver, Gold and Silver Wastes. ZINC SHAVING MANUFACTURER. Fresh out always in stock. TELEGRAPH orders solicited.

## ONCE IN A LIFE TIME

is often enough to do some things. It's often enough to buy a wagon if you buy the right kind. The

## ELECTRIC HANDY WAGON

lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electric Steel Wheels, with straight or stagger spokes and wide tires. Wheels any height from 24 to 40 in. It lasts because tires can't get loose, no re-setting, hubs can't crack or spokes become loose, felloes can't rot, swell or dry out. Angle steel bounds. THOUSANDS NOW IN DAILY USE.

Don't buy a wagon until you get our free book, "Wagon Salesmen."

ELECTRIC WHEEL CO., Box 239, Quincy, Ill.

## ASSESSMENT NOTICES.

THE CALIFORNIA DREDGING COMPANY.—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of October, 1901, an assessment (No. 5) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, 120 Sutter Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 25th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of December, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary, 120 Sutter Street, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of October, 1901, an assessment of five (5) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No. 323 of the Parrott building, Nos. 825 to 855 Market Street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 26th day of November, 1901, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 23rd day of December, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. C. ANTHONY, Secretary, Office—Room 323, Parrott building, Nos. 825 to 855 Market street, San Francisco, California.

TANANA MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of September, 1901, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary, Office—Room 801 Claus Spreckels Building, San Francisco, California.

THE THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of October, 1901, an assessment (No. 11) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 632 Sacramento Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. F. FREY, Secretary, Office—632 Sacramento street, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of October, 1901, an assessment (No. 4) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary, Office—Room 801, Claus Spreckels Building, San Francisco, California.

## Some Reasons

Why You Should Insist on Having

## EUREKA HARNESS OIL

Unequaled by any other.

Renders hard leather soft.

Especially prepared.

Keeps out water.

A heavy bodied oil.

## HARNESS

An excellent preservative.

Reduces cost of your harness.

Never burns the leather; its

efficiency is increased.

Secures best service.

Stitches kept from breaking.

## OIL

Is sold in all Localities

Manufactured by Standard Oil Company.

## Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines OUR SPECIALTY.

—WE BUILD—

**GOLD DREDGES** Complete in  
Running Order

to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

SEND FOR DREDGING CATALOGUE NO. 17.

—WE ALSO BUILD—

ALL KINDS OF

Mining, Milling, Concentrating,  
Pumping, Air Compressing,  
Hydraulic, Water Wheel,  
and Hoisting Machinery.

Evans Hydraulic Gravel Elevators.

—We publish sixteen catalogues. Write for one in the line you are interested in.—

## THE RISDON HAMMERED SHOES AND DIES.

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outlast any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

RISDON IRON WORKS, San Francisco, Cal.

## "THE DANIEL BEST"

## 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a total capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

GATES IRON WORKS, Chicago.  
DICKSON MFG. CO., Scranton.

MANUFACTURER OF

## Mining Machinery

There are  
reasons  
why

the adjustable and practically indestructible GATES ROCK AND ORE BREAKERS produce crushed material at a much lower cost per ton than other breakers. To more than 5,000 users located in all parts of the world, the cause is readily apparent. Gates Breakers not only have much greater capacity, require less power, run without vibration, stoppage or delay, with less wear on the crushing surfaces and permitting carloads of material to be dumped directly into the hopper of breaker, thus reducing the employment of handling devices and manual labor to the minimum, but other convincing reasons supported by indisputable evidence of the superiority of Gates Breakers are given in Gates Catalogue No. 1. Avoid a false start and possibility of failure. There is absolutely no breaker made that will compare with the "Gates."

We are prepared to build crushing plants complete, screens and perforated metal of all kinds, elevators, hoists, engines, and boilers. We also build cement machinery of the latest designs. ESTIMATES FURNISHED UPON APPLICATION.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

## EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeannesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeannesville Pumps.

We claim that in Jeannesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

## PACIFIC COAST RUBBER CO.,

21 FIRST STREET, SAN FRANCISCO, CAL.

### Corrugated Pneumatic Hose.

Made absolutely seamless in the fabric as well as in the cover. So constructed as to form, practically, a compact body. No splitting of the tube and opening of the plies, much lighter and more pliable, and will stand shorter bends without kinking than hose made in the ordinary way; will withstand a greater air pressure than any hose double its weight offered on the market.

We guarantee this hose to outwear any other style or make of hose for the conducting of air under pressure, whether for drills, hoists or pneumatic tools, and we are satisfied, beyond any doubt, that for this work it is by far the most desirable and economical hose manufactured.

Plain; Wound with Flat or Round Wire; or Covered with Woven Marline Jacket. Sizes 3-8, 1-2, 3-4 and 1 Inch.

## PATENTS

DEWEY, STRONG & CO.

(ESTABLISHED 1860.)

SAN FRANCISCO, CALIFORNIA,  
and WASHINGTON, D. C.

OLDEST AND LARGEST AGENCY ON  
THE PACIFIC COAST.

WHY TO BE PREFERRED?

BECAUSE--

Inventors have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that all the inventor's ideas will be correctly conveyed, avoiding mistakes and vexatious delays.  
Inventors living at a distance from San Francisco may, where they so desire, consult directly with our Washington office.  
Inventors receive the benefit of over thirty years' continuous, successful experience.  
A description of the patented invention will appear in the *Mining and Scientific Press*.

We have a complete Patent Library, including official records since 1793 and full certified copies of all patents issued since 1872. These are for free examination by any one who desires.

We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches, and give opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete. Inventors' Guide sent free on application.

330 Market St., San Francisco, Cal.

AND

918 F St., Washington, D. C.

## COLORADO'S GOLD

Output for 1900 is unequaled by any State in the Union. Cripple Creek, Leadville, and all the important mining towns are reached by

PROPELLER PUMP.

## THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its  
Advantages:

Wearing parts reduced to a minimum. All parts are interchangeable.  
Will take ore from finest mesh up to 6-mesh without sizing.  
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.  
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD.  
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

**THE COLORADO IRON WORKS CO.,**

Established 1860.

DENVER, COLO., U. S. A.

## ADAPTABLE TO THE ORE--THE AMERICAN STEAM STAMP

will run without close attendance after being easily set to deliver the blow best suited to the ore; very rapid heavy blows for tough hard ore, gentler treatment for sliming friable ore.

THE MILL FOR FRONTIER USAGE--THE AMERICAN STEAM STAMP

as the "steam hammer" valve and the "wedge base" adjustment for wear of shoes and dies. These work perfectly with unskilled handling. The American gives no trouble, is durable and unfailing.

Though built for heavy and continuous service, it requires only small foundations, thus avoiding any great expense or labor in installation. We make the mills sectional for muleback when so ordered. We also make gravity stamps.

**American Engineering Works,**

## PATENTS

**DEWEY, STRONG & CO.,** San Francisco, Cal., and Washington, D. C.

We are prepared to transact business with our clients direct from either our San Francisco or our Washington office. We have representatives in every country in the world having patent laws. The information accumulated through long and careful practice before the Patent Office and the frequent examinations of patents already granted, for the purpose of determining the patentability of inventions submitted to us, enables us to advise inventors, often saving them the expense of applying for a patent upon inventions which are not new. All worthy inventions patented through us are described in the *Mining and Scientific Press*. Guide to inventors sent on application. Address

**DEWEY, STRONG & CO.,** 330 Market St., San Francisco, Cal., or 918 F St., Washington, D. C.

**ABSOLUTE  
SAFETY**

IS ASSURED USERS OF

**THE DAVIS AUTOMATIC SAFETY-BRAKE  
HORSE HOISTER.**

The automatic brake is positive and powerful yet sensitive. No ratchets to stick or break, or broken gear teeth to cause accidents. The load CANNOT run back until YOU say so.

You can learn more of this admirable machine as well as other High Grade Mining and Milling Machinery from our 142-page Catalogue.

# Joshua Hendy Machine Works,

Nos. 38 to 44 Fremont St., San Francisco, Cal.

## THE JEANESVILLE Miners' Sinking Pump

HAS THE FOLLOWING ADVANTAGES:

It is designed especially for the roughest and most exacting service.

It is particularly adapted for gritty water.

It is very strongly and yet compactly built, so as to occupy as small a space as possible.

It can be operated in any desired position, either vertical or horizontal.

This pump is an improvement in many ways over other makes of sinking pumps.

The cap under the Plunger is fastened with Hinge Bolts, one bolt retaining the cap after the rest are released. Also providing Priming Valves in the Water Valve Chest Cover to prime the Lower Valves from Column Pipe, and they are so close as to be in no danger of breaking off.

We have thickened, and thereby strengthened, the wall of water passage leading from lower end of plunger. We have also strengthened the form, without adding materially to the weight of the connecting piece opposite the water passage. These have been weak points in other sinkers.

All parts commonly made of brass, such as water valve seats, valve stems, valve springs, etc., are made of Phosphor Bronze.

All parts are made to gauge, so that they can be easily renewed.

Parts for repairs will interchange with Cameron Sinkers of the same size.

### MORAN FLEXIBLE JOINTS.

Simple. Efficient. Durable.

All Metal Construction.

Positively Tight Under Any Pressure.

Applicable to Steam, Air, Water, Oil.

## KNIGHT'S WATER WHEEL.

The accompanying cut shows the general arrangement of The Knight Water Wheel, direct-coupled to a 750 kilowatt generator, with governor mounted on top of wheel casing.

These wheels are designed for 100 to 2500 H. P. Highest efficiency and regulation guaranteed.

WHEELS FROM 6 TO 24 INCHES, ENCLOSED IN CAST-IRON CASING.

Wheels for mill and reversible hoisting works a specialty.

KNIGHT & CO., Sutter Creek, Cal.

 you afford to be without it?

No. 043 **BUTTON BALANCE**, 10-inch beam. Sensitive to  
 1-100 Milligramme. This is a double-column button bal-  
 ance with all latest improvements, including our new ad-  
 justing device and rider rod lock. It is accurate and as  
 rapid as a beam of this length can be. For an office doing  
 a moderate amount of work, it is the best balance to be  
 had for both gold and silver. For complete description and  
 prices of this and other balances send for catalogue A3 to

### Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

#### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## P & B Ready Roofing

If it were possible to make a better roofing in the one or more points that go to make a good ready roofing, we would certainly make P & B Ready Roofing better.

Is it not reasonable to presume that if it were possible to make P & B Ready Roofing better, we would have done so during the 16 years we have made and sold this excellent roofing material?

We not only sell P & B Ready Roofing, but we have a roofing department whose business it is to repair roofs of every manner, shape and kind. This department is in charge of a roofing expert who has splendid opportunities to study all roof requirements.

We are continually in touch with every phase of roofing—the requirements, the materials, facilities, etc., so we know the roofing business and we make the very best roofing that science, facility and money can put together and we call that roofing P & B Ready Roofing.

**FIRE**—Well, it isn't absolutely fire proof, because it will burn slowly when continually subjected to the flame, but sparks and heat without flame cannot set it on fire.

**WATER**—Water cannot injure it—cannot get through it—and it cannot rot it. P & B Ready Roofing is absolutely water proof.

**GASES—FUMES**—While gases and fumes, heat and cold, rot, decay and deteriorate tin, iron, shingles, slate and tar, it has no effect whatever on P & B Ready Roofing. We have never heard of fumes, gases or smelter smoke causing the slightest injury to P & B Ready Roofing.

**SUN HEAT** has not the slightest effect on it—won't expand, crack or melt it, nor cause an odor to arise. Furthermore, P & B Ready Roofing is a non-conductor and no matter how hot the sun shines down on your building, heat cannot get through P & B Ready Roofing, and it won't impart heat, so your building is cooler in summer and warmer in winter. Cold weather does not make any difference either.

**SNOW** won't remain on a sloping roof covered with P & B Ready Roofing or go through a flat roof made of it. Up in Dawson and Cape Nome we have sold hundreds of rolls, because it will stand the climate with wonderful endurance.

**ACIDS**—We know of no acids that are likely to affect it while on the roof unless it is deliberately poured over the roofing. Acids compounded by smoke, fumes, and rain water won't hurt it one bit.

**CONVENIENCE**—P & B Ready Roofing is certainly convenient, if it is anything. It is about  $\frac{1}{4}$  of an inch thick and 32 inches wide and put up in rolls containing enough roofing to cover 200 square feet. The weight per roll is from 90 to 120 pounds, according to grade. It is compact, does not weigh very much—is not bulky or hard to carry. You can take it in your trunk if necessary, or you can put it on horseback or in a light buggy and that is something you cannot do with tar, slate, iron, tin or shingles.

**AND AGAIN**—It don't cost much to ship it—the freight rate is very low.

But last, and above all, is its durability, strength and quality—once it is on your building that is the end of your troubles.

Rain may pour; snow may come and wind may howl; heat can boil and gases annoy, but your roofing is proof against them all and your building protected. Your mind may rest free and easy, for you will not have any roofing troubles to bother or roofing expenses to pay.

We are always glad to give further information—write for it. Address Department A, in order to get quick reply.

## The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot. (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tannage) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

## AARON'S ASSAYING, PART I.

### FOURTH EDITION.

Revised, Rewritten, New, Improved.

This practical treatise on assaying has long been the favorite among practical men. The new edition is up to date. Price \$1, postpaid anywhere.

**Book Dept., Mining and Scientific Press,**  
330 MARKET ST., SAN FRANCISCO, CAL.

## Aaron's Assaying, PARTS II and III.

THIRD EDITION—REVISED AND REWRITTEN.

New type; new illustrations; new matter; better than ever; reduced in price to \$1.50 postpaid to any part of the world. The practical character of this book has made it the favorite everywhere in the mining world among men who want such a manual on assaying.

**Address Book Dept. Mining and Scientific Press,**  
330 MARKET ST., SAN FRANCISCO, CAL.

No lugs or knots of any kind required on the traction rope, giving longer service, and saving in repairs. . . .

Illustrated book upon application.

For particulars, address **NEWTON M. BELL**, Agent, 308 Market St., San Francisco, Cal. **R. D. SEYMOUR**, Manager, 1711 Tremont St., Denver, Colo.  
**NEW YORK OFFICE**--Cooper, Hewitt & Co., 17 Burling Slip. **CHICAGO OFFICE**--1114 Monadnock Building.

## Coke From China for Iron Smelting on Pacific Coast.

This journal in its issue of the 19th inst. editorially called attention to the commercial possibilities for iron and steel manufacture on the Pacific coast. It indicated as the source of the fuel supply China and Siberia, stating that coke could be put on board ship in those countries for \$1.50 a ton and landed at Pacific coast blast furnaces to cost not more than \$5.25 a ton. In stating the figure of \$1.50 a ton on board ship, Vladivostok in Siberia was considered as the shipping point for the coke. This place is the center of a great coal field, many of the veins being at the sea shore and other discovered beds less than 20 miles away by rail.

Since it was in print Herbert C. Hoover, a California mining engineer, a former contributor to this paper, who has been in China for three years investigating its mining resources, particularly coal, has returned to San Francisco. In the course of an interview he is credited with this statement relative to the coal resources of China and their utilization:

In coal China possesses greater resources than any other country in the world, both bituminous and anthracite. In the provinces of Shansi, Chihli and Honan there are fully 8000 square miles of horizontal beds. The bituminous coal occurs in almost every province, and in some instances is of fine coking qualities. This coal will be a factor on the Pacific coast later on, for China can supply coke landed here at a rate which will make possible the smelting of iron in California. The Chinese Engineering & Mining Co., of which I have been general manager, is operating a bituminous coking coal field in Chihli province, 60 miles from Tien-tsin, constructing a harbor at Ching Wan Tow, 70 miles from the mines, and preparing to ship coke to San Francisco, delivering it at not over \$6 a ton. Cheap labor and cheap back freights instead of ballast will make this possible. The effect on Pacific coast trade should be considerable, as there is a lack of back loading to China, and therefore high outward freight rates.

It will be noted that Mr. Hoover's statement is fully confirmatory of what this paper had already said. The difference between \$5.25 a ton and \$6 is accounted for in part by the slightly higher cost of putting the coke on board ship in China due to longer rail transportation, and the remainder by the profit margin for the coke maker, the \$5.25 figure being based on the ownership of the coal mines, coke plant and ship transportation by the iron and steel manufacturing industry establishment.

## Gold Mining in Korea.

On another page appears an exceedingly interesting description of gold mining in Korea, as inaugurated by an American company, written by a mining engineer, at the present time professionally engaged there. The illustrations that accompany the article tell the story of gold mining in that little known and, indeed, only lately known country, even better than the descriptive words. Both the matter and the illustrations present to our readers a complete and accurate statement of the new gold mining of Korea.

So little has been said about Korean gold mining during the four or five years that it has been developing, that the possible commercial importance of the industry there has been discounted wherever opinions have been expressed. As a fact, however, Korea is an exceedingly rich gold-bearing country, measured by even the high standard of comparison set by early-day gold mining of California. In 1897 the Collector of Customs at Gensan, Korea, informed the writer of this that the placer gold production of the native miners—there was no production then from the one foreign operation of mines just starting—was over \$4,000,000 a year, as indicated by the exports of the metal that were registered at the custom house.

The Korean gold mining and milling plants for gold quartz ores have another distinction, the statement of which will be somewhat of the nature of a surprise. Excepting only the gold quartz milling plants in India, the Korean plants illustrated are the first to be established in Asia. With all the exploitation of Siberian placers for a half century past, there is yet no gold quartz milling plant in that country, and no exploitation, as distinguished from prospecting, of gold quartz lodes. The first step made in Korea towards modern mining business has skipped by all the successive steps of slow advance which have evolved advanced gold mining practice, and has started the latest and the best as the beginning. The illustrations show mills and hoists, and our writer's text describes mining labor methods, in no way different from their counterparts in the United States.

The governmental conditions surrounding the industry in this new land are said to be satisfactory. There is an absence of the fussy officialism and official exploitation of foreign capital that invests in mines, that has made the establishment of American gold mining practice using either Russian or foreign capital a failure in Siberia. The Korean Government and people have, fortunately for their own material interests, encouraged and permitted the American miners, who are using American capital to exploit their gold mines, to apply without restriction American mining practice. The Korean Government and people are represented as being so satisfied with these first results of this happily-conceived policy that they would be glad to come under the political control of the United States. Considering the mutually advantageous commercial and industrial relations that citizens of the United States are fast developing from the exploitation of Korea without exploiting its people, it is certainly worth while to our country to act politically so as to maintain the conditions which permit the existence and increase of the American system.

## "Average" and "Mean" Costs.

The statement that the average cost of production of copper is about 9 cents a pound appears frequently in discussions of copper production as a basis for the conclusions of the writers. The statement is not true, unless by a most liberal construction of words it can be held half true. The fact is that there is no such thing as an "average" cost of production of copper. There is a "mean" of costs of copper production, which is about 9 cents a pound. Average and mean, as used in this relation, have not the same meaning and cannot be used as equivalents. The use of the word "average" carries with it the inference to the mind of a reader who is not technically familiar with the arts of copper mining and metallurgy that the physical limitations of these arts determine the costs of production, whereas they do not. A reader technically familiar with the arts is not misled into this inference; but the publications in which the

statement appears are the principal source of information of the non-technical reader, whose interest is, if any, that of an investor seeking profit. The constant reiteration of the misleading statement induces with such its acceptance as true, and its use as a guide to investment. The word "mean" used in connection with the "costs of production," not "cost of production," implies just what it says. It is the mean cost of all the different costs of production. With copper selling at 17 cents a pound, the cost of production is from some operations as low as 2 or 3 cents and as high as 15 or 16 cents. The mean is about 9 cents. With copper selling at 10 cents a pound, the cost of production from some operations would still be as low as 2 or 3 cents, but only as high as 8 or 9 cents with the mean of costs about 6 or 7 cents. It is unthinkable that copper will be produced at a cost greater than the market selling price. The statement, then, that the "average" cost of production of copper is 9 cents, does not mean that at all. When for it is substituted the words which do say what it means, the expression becomes meaningless as the basis of conclusions. The cost per pound of copper production is determined by first deducting from the costs of mining, metallurgical treatment and transportation to market of one average-value ton of the copper ore mined, the net sale value of the gold and silver recovered from that ton of ore, and then dividing the remaining cost sum by the number of pounds of copper obtained from the average-value ton of ore mined. Comparisons made between this last figure and the existing selling price, or the anticipated future selling price, can then be used and definite conclusions formed.

## Mines vs. Mining Propositions.

An announcement of interest to people who are being asked by promoters to invest in mines is quoted as follows:

The business men of Helena, Mont., have set an example that might well be followed by the residents of all mining towns who have the welfare of their locality at heart. In future every mining company that claims Helena as its home will be thoroughly investigated by the Committee on Mining of the Helena Business Men's Association; and, if it is found to have any "wildcat" characteristics, it will be unsparingly condemned through the medium of the press, and unsuspicious investors will be warned away.

The necessity of this move has been made apparent from the fact that, throughout the East, a large number of these irresponsible mushroom companies have been formed, without a foundation in fact for their extravagant claims of fortunes that await those who buy their stock. The fact that a decided interest is being taken in the mineral district round about Helena has caused numbers of these unscrupulous concerns to claim a location in this city.

Postmaster A. P. Fisk states that he continually receives letters from all parts of the East from people asking the Postmaster if they can place confidence in such and such a company. He has repeatedly gone to the county records, only to find that such companies never existed, except in the imaginations of their putative officers. Fisk has so informed all who have applied to him for information.

The idea voiced in this announcement is to be commended, but in simple justice to all the interests that will be affected by its proposed action, there should clearly be recognized the difference between "mines" and "mining propositions." A mine, a real mine, cannot be a wildcat. A mining proposition may be a "wildcat"—a fraud—without reservation on any point. The promoters cannot help knowing if their proposition is this kind of a "wildcat." A mining proposition may be a "wildcat," and yet, the mine that is its asset may be a real mine. Fraud, misrepresentation and extortion should be unsparingly condemned, not by indecisive generalization, rumor or repute, but by a statement of the true facts of the particular case investigated. It is to the interest of a community to have its undeveloped mineral deposits prospected. This involves risk surely, and loss possibly. To these legitimate burdens communities should see to that there are not added fraud and theft. Expressed in other words, a community should in self-protection see to it that it is not made by promoters, under pretense of mining in its vicinity, the opportunity for robbing the pockets of strangers attracted by the pretence.

## Concentrates.

THE lead production of the world for the year ending June 30, 1901, is estimated at 617,300 tons.

THE tensile strength of Manila hemp fiber averages about 30,000 pounds per square inch of section.

A MAGNETIC method of separation is employed in Joplin, Mo., to take out the pyrite from zinc concentrates.

THERE are now in operation in California electric power transmission plants, using water as the prime mover, that aggregate over 80,000 H. P.

SINCE the Seattle, Wash., assay office was opened on July 15, 1898, it has received gold of the commercial value of \$52,780,579.45, principally from the Klondike and Alaska.

AT the Onelda mine, at Sutter Creek, Amador Co., Cal., fuel oil at \$1.50 a barrel is equal to wood costing \$4.50 a cord, with the balance of lesser advantages in favor of the oil.

THE largest single shipment of refined copper on the Great Lakes is 2800 tons, worth almost \$1,000,000, taken by the steamer Mohawk, from Dollar Bay, Houghton, Mich., in October, 1901.

In sinking the shaft on the Senator mine, at Steamboat Springs, Nevada, drill holes are kept several feet in advance of the sinking, in order to indicate the presence of hot water channels from the hot Steamboat springs adjacent.

A TWENTY-FIVE-TON charge of powder in one blast at the Decleville quarries, near Los Angeles, Cal., is estimated to have loosened 200,000 tons of rock, which would be a breaking from place of four tons or two cubic yards to the pound of powder.

THE depreciation and repair bill on water power plants is less than on steam plants. Four per cent is usually ample to cover these two items in water power plants, while the corresponding allowance for a steam or gas engine plant is from 10% to 15%.

THE United States Supreme Court has sustained the State law of Tennessee making store orders redeemable in cash. One of the opinions upheld the law as applied to State corporations and the other decision sustained it as applying to foreign corporations.

THE annual report of Mine Inspector Hall of Michigan shows 13,498 men employed in copper mining in Houghton county during the year ended Sept. 30, a decrease of 473 from the aggregate of the preceding year. Accidents numbered thirty-three, eleven being fatal.

THERE is no work on the "Distillation and Analyses of California Crude Oil." As the treatment of Pennsylvania and Russian oils are dissimilar to that required in the California oils, books describing the refining of these oils are only suggestive as to the mode of refining California oils.

EXTRAVAGANCE is a fault of which no true engineer is guilty. One of the greatest claims the engineering profession has upon the respect of the public is that it works constantly and persistently to increase efficiency, to reduce cost, to convert what is harmful or useless into sources of wealth and to avoid waste.

THE chief medical officer to the Government of the Gold Coast in Africa, Dr. N. Kaye, says that twelve months residence on the coast of that country and eighteen months up country are, in his opinion, the outside limits that white men should be compelled to stay, after which they should take six months leave.

THE Keswick Electric Power Co. has put in near Shingletown, in Shasta county, Cal., a pipe line 6800 feet long and 3 feet in diameter, delivering water at the water wheel under 1200 feet head. The pipe is set in a cement bed. Two days were taken to fill it, in order to give the pipe an opportunity to take up the strain of the water column gradually.

THE U. S. Circuit Court in what is known as the King case of the Bunker Hill M. & Concentrating Co. vs. the Empire State-Idaho M. & Dev. Co. held that two claims could not be located on the linear section of one vein so as to give both locations extralateral rights. In other words, one owner could not split the vein by two planes and follow down indefinitely under the locations.

THE weight of the U. S. silver dollar is 412.5 grains, of the Mexican 418.16 grains. The U. S. dollar is 1.5 inches in diameter and .08 inch thick. The Mexican dollar is some larger, but very little. The U. S. dollar is 900 fine in silver, 100 in copper. The Mexican dollar is 903 fine in silver and 97 copper. The Mexican dollar often contains a trace of gold from the imperfect refining methods used.

TWO ARIZONA COPPER MINING COMPANIES, the Shannon and the Arizona, operating contiguous mines at Clifton, have by conveyances carried out an agreement which forever eliminates the question of extralateral rights as between them. They have made the common boundaries on both end and side lines vertical planes, regardless of the apex, strike or dip of an ore body crossing the line.

IN the California quartz mining regions it is usual to find the larger number of the springs coming to the surface on the uphill side of the quartz veins. The country rock stratification collecting water, it descends with its bedding until the quartz veins are encountered, cutting off the continuity of water channels in the country rock

and diverting it upward under pressure along the relatively free contact with the ledge.

ALASKA has three hour meridians, the 135th, the 150th and the 165th degrees of longitude from Greenwich. The 135th is two minutes twenty-four seconds of time west of Juneau and the meridian is just one hour west of the 120th meridian, which determines Pacific standard time in the U. S. Southeastern Alaska is to use 135th meridian time, which will be known as Eastern Alaska time, and thus continue the system of standard time in use in the United States.

A GOLD BELT or copper belt is a form of expression used to describe a line or band of ore deposits of the particular metal which in the relation of the deposits to each other suggests the idea of a common geological origin and, incidentally, continuity. It is not intended to convey the idea that the continuity must be direct or close. The several deposits which are together designated a "belt," may be separated by intervals of several miles in which no deposits are found.

THE efficiency of the undershot water wheel is from 27% to 30%, of breast water wheels from 45% to 50%, of overshot water wheels from 50% to 70%, of various types of turbine water wheels from 70% to 88%, and of various types of tangential water wheels from 85% to 92% for large wheels and 75% to 85% for small wheels. It is considered safe to take the efficiency of good modern water wheels at from 80% to 85%. Generally the efficiency does not fall off very much at three-fourths load.

OWNERS of farms at Redding, Cal., 6 miles southeast of Keswick, where the copper reduction plant of the Mountain Mines Co. is situated, have again brought suit against the company for damages and a restraining order to compel the company to condense the sulphur fumes from the open-air roasting of the copper and iron pyrites preparatory to smelting. The company alleges that it is impossible to condense the fumes except at such a cost as would make their business unprofitable.

THE cost of water per horse power year is quite variable, and an average figure is of little significance, as it can easily be misleading used as a basis of estimates. About the lowest figure is the cost of a Canadian plant (\$6.25). Niagara water power is sold for \$13 per horse power year, from which its cost may be inferred as being nearly as low as the Canadian referred to. At some installations the costs run up to \$25 and \$30 per horse power year. The average figure is stated to be from \$10 to \$12.

THE Visalia, Cal., Dist. U. S. Land Office has made a decision in an oil land case in favor of the homestead claimant, in which the facts are claimed to be that the mineral location for oil was made and title to it passed by deed from the locators before the homesteader made his filing and entry on the land. Later the owners of the location undertook to start sinking a well and were ejected by force by the homesteader, who had before this commenced his residence on the land. The decision will be appealed from.

NO ONE can say which county of California, or indeed of any State or Territory of the West, is the best for a prospector. They are all good. They all offer the opportunity for the prospector. It is impossible to say of any of them, "all is now known of possible mines it is possible to know." The history of all of them proves that there are always others—mines which the late comer does discover for the first time or mines which the first comers discarded.

SOUTHEASTERN ALASKA is limited to that portion of the district including and extending from the Lynn canal southeasterly down the coast to the Portland canal. It includes only a portion of the narrow strip of coast, taking in the islands and a strip of mainland 30 miles wide. The islands are very superficially explored. Douglas island at Juneau and some of the islands near Ketchikan have been explored inland from the coast, but only to a very limited extent. The strip of mainland has been explored back of Juneau and Wrangal, but very little at other points. West of Icy straits the district is described as the Seward peninsula, never as southeastern Alaska.

ZINC AMALGAM is sometimes used for copper plates. When so used the copper plate should be cleaned with a swab with well diluted sulphuric acid; then while still wet the zinc-mercury mixture is applied. To prepare the zinc amalgam clip sheet zinc into small pieces and immerse them in mercury, after washing them with a little weak sulphuric acid and water to remove any oxide. When the mercury will absorb no more zinc, squeeze through chamois leather or calico, as for silver amalgam, and well rub in. The plate thus prepared should stand for a few days, dry, before using. If, before amalgamation with gold takes place, oxide of copper or other scum should rise on this plate, a little very dilute sulphuric acid will instantly remove it.

A NEW METHOD of economically recovering the tin from the tin plate scrap and clippings has been patented. A convenient vessel is divided by a porous or permeable partition, preferably, for cheapness, made of wickerwork. One side is filled with coal, the other with tin plate scrap, the former being the cathode, the latter the anode, and the charging electrolyte being sea water or a salt solution. A number of such cells are made and connected up, forming a battery capable of working a separate electrolytic bath, for plating or other useful purpose. The iron dissolves to ferric chloride, the tin partly falls to the bottom and part passes to the coal

(the cathode). The final solution of any iron is effected in the electrolytic bath. The process is such that the separation of the tin and solution of the iron yields the current necessary for cleansing the recovered tin.

AN excellent permanent corner monument for a mining claim can be made with concrete. A pit 16 inches square can be excavated 16 or 18 inches deep if in soil or gravel, or to bedrock only if the latter is a less distance down. In this set a form made of inch boards 12 inches square clear inside dimensions. The height can be such as to project from 12 to 30 inches above the surface as desired. Mix the concrete in the proportions of one part cement, two parts sand and five or six parts clean gravel or clean broken rock. Fill this into the form, ramming it as the filling proceeds. Large pieces of rock can be used in the center of the mass to save concrete. For marking, letters made of wood, "V" shaped, can be faced against the side of the form in their proper relative places as the filling proceeds. When the top of the form is reached the concrete can be leveled off or shaped as desired. The boards of the form should not be nailed together. At least one side should be fastened with screws or clamps to admit of easy removal when the concrete sets. After the box is removed the wood letters are picked out and the monument is finished with a float of clear cement. A monument of this description is preferable to wood posts in localities where claims are many and valuable and where in or adjacent to considerable centers of population. Wood posts decay readily and are easily destroyed. While very satisfactory for locations, the value of which is undetermined, wood posts should be replaced with stone or concrete monuments where the mines are valuable and permanent.

WHAT is known as the "hole contract" system of payment for work to miners is a method originated by Carl E. Davis, E. M., superintendent of the Center Star and War Eagle mines, at Rossland, B. C., to meet the local conditions and requirements in those mines. Under the day-labor wage system the amount of work performed per man working underground was found unsatisfactory. The breaking of ore in the mine was not confined to definite wall limits but varied irregularly with the extent of mineralization of the hard country rock, which when rich enough was ore. The width to be broken varied from 4 or 5 feet to 100. The amount of ore to be broken varied so that no contract system of payment based on ore broken down could be used satisfactorily. These changes, however, did not affect the rate of drilling per man over 5% monthly. Payment was then made to miners on the number of feet drilled monthly, machines being used. The place, direction and approximate depth of the holes to be drilled are designated by the shift foreman. The length of holes drilled is measured at the end of the shift time before blasting and a copy of the record given to the contracting miners. The men work in crews of four, two on each eight-hour shift. The third eight-hour shift is given to blasting. Under this system the amount of work done by the men was satisfactory to the management and the miners earned an average of \$1 a day more than they did working for day wages. The comparative costs to the mine were per ton of ore broken in stoping, by the (hole) contract system, \$0.477; by the wage system, \$0.865. In development work, per foot of drift heading, (hole) contract system, \$8.79; wage system, \$11.14. Drift heading advance per month average was increased under the (hole) contract system from 50.8 feet to 97.5 feet. In shaft sinking the rate of advance per month increased from 27.2 feet to 58 feet.

TUNNELS, as an alternative construction for the wooden flume conduits used for supplying water to the electric power plants in the California mountains, are being seriously considered. The difficulty with the flumes is danger from breakages due to forest fires. The enormous cost is the objection to tunnel construction. The danger to flumes from fire can be reduced very much by clearing the land adjacent to the flume of trees and undergrowth before constructing the flume. A clearing of 40 feet on each side of the flume is sufficient. On the upper side a shallow cut should, where practicable, be made to receive burning pine cones as they roll down the mountain slopes. The special point of danger to the flumes is in the footing of the high trestle bents. Here the clearing should be specially thorough to keep a grass fire from reaching the sills and post footing. The construction of trestle bents to support a flume should be avoided by the substitution of an excavated grade in the rock the full width of the flume. Part of this grade can be made a dry wall, if more convenient. Every spring the cleared strip should have the grass burned off of it and the starting undergrowth cut down by the flume tenders. The preceding, accompanied by vigilance on the part of the tenders and a flume full of water, should make the starting of a fire impossible. Tunneling should be a last alternative. It is subject to dangers of its own, in liability to caves, which stop the flow of water, and are more difficult to repair than a burned flume. There is notice of a fire and a chance to protect against it. A cave will come without warning, and the conditions surrounding the operation of a power plant limit the opportunities for inspection. A substitute for flume construction that is cheaper than tunneling and free from its objections otherwise is the grading out of the mountain side the full width of a ditch and a base for its outer wall. On this base a concrete wall can be built and the floor of the ditch can be grouted with cement. This construction is more costly than a wooden flume, but much less costly than a tunnel would be.

## Quartz Mining in Korea.\*

Written for the MINING AND SCIENTIFIC PRESS.

The Korean Government has granted several concessions to foreigners for mining purposes, but only two of these are carrying on work on the ground. Of the two the Oriental Consolidated Mining Co., an American corporation, in the northwestern part of Korea, has passed the prospecting stage and become a bullion producer. A description of this company's mines and their operation may be taken as a fair illustration of what can be expected from mining in this country.

These mines are situated in the northern part of Ping-Yang Province, about 300 miles north of Seoul, the capital of Korea. The route of transportation is by steamer from Nagasaki, in Japan, to Chinnampo, in Korea, five days' journey, with stops, thence to Anjou, one day on a small steamer owned by the company, and from Anjou 38 miles on a good road by wheel or horse. The journey from the mines to Chemulpo takes ordinarily three days by water, or ten days overland. The overland route is the winter route, steamers being shut out by ice.

Sixty-five miles west of the mines is the city of Wee-ju, the walled city that, since the first settling of Korea, has guarded the gate to China. The main road from Seoul to Peking passes through Wee-ju. The city is on the Yalu river and looks directly into China—the "great country" of the Koreans. The nearest point of the Yalu to the mines is about 25 miles, and every summer large numbers of Chinese cross into Korea and travel to the mines in search of work.

The gold quartz mines being worked by the Oriental Consolidated Mining Co. are scattered. The three main camps may be considered as forming the points of a triangle whose sides measure about 23 miles. These camps are connected by telephone. At the present writing there are three mills in operation, one of forty stamps and two of twenty stamps each, while another of forty stamps is being con-

are very skillful with a double-hand hammer, and their white foremen claim they are equal to the best white miner at that work. They cannot, however, be relied upon to place their holes, nor to handle powder. Seemingly they cannot realize the care necessary when working with explosives. Add to this the fact that they are inveterate thieves and shirkers, and it will be seen that only by constant watching and searching can they be made to do a day's work and prevented from stealing anything they can lay their hands on.

Each shift has a native boss, who assists the American on duty. He can usually speak a few words of English.

Preparations are being made to install a compressor to try machine drilling.

The mine hoist engineers are all Koreans, usually boys between eighteen and twenty-two years. They show more aptitude than older men and quickly become expert, though they seldom know anything

that the amalgamator has as many natives as he pleases to help him. It is on battery work that the Chinaman looms up. Some of them are as valuable as white men around stamps and mortars. On the other hand, the concentrators are tended, almost without exception, by Korean boys.

Japanese engineers, under the supervision of a European machinist and engineer, attend the big mill engines and do the repairing of engines and pumps. Each camp has one or more Japanese blacksmiths, who do very good work. Several white carpenters and millwrights are on the concession, and a number of Japanese carpenters are employed. Around the mines Korean carpenters frame timbers and do other rough work, but their work is poor and crude compared to that of the Japanese, who excel in light work. The wages paid to Asiatics is very low. The following is about the usual rate per month in United States gold:

|                                                              |                    |
|--------------------------------------------------------------|--------------------|
| Korean mine bosses.....                                      | \$10.00 to \$30.00 |
| Japanese engineers, blacksmiths and carpenters.....          | 25.00              |
| Korean carpenters, timbermen, engineers and blacksmiths..... | 9.00               |
| Korean or Chinese miners.....                                | 7.50               |
| Korean or Chinese shovelers, car men, mill hands, etc.....   | 6.00               |
| Coolies.....                                                 | 4.50               |

While these rates seem at first glance ridiculously low, it must be remembered that, comparatively, the Korean workman is very little worse off than the American at home. His monthly board and room cost him \$2 per month at a native hotel, or, for coolies, 44% of his wages. When he lives at home he spends only \$1.50 for his food, or 33%, leaving him 66% over and above his food and room. Comparing this with the same grade of labor in America, which commands from \$1 to \$1.60 per day, with board from \$12 to \$24 per month, it will be seen that the difference is very slight. And when the Korean turns to clothe himself and buy his tobacco he is at a great advantage over his white compadres, for one suit of clothing lasts him until it rots away, and costs but 50 cents to \$1, while he can buy a backload of tobacco for the same price.

Lumber and oak cordwood are delivered at the mines by Koreans for \$15 per thousand and \$2.25 per cord, respectively. Mining supplies and other freight is delivered at Chinnampo by steamer, thence to Anjou by the company's vessels, and from Anjou to the mines by wagons and native bull carts. The stores carry a stock of necessities and many luxuries, though the difficulties incident to the transportation often cause a famine in certain articles, and prices are necessarily high.

Mail reaches the mines about every ten days by a regular system of carriers between camps and the nearest postoffice, and the concession is in direct communication with Chemulpo and foreign cable by the Imperial Korean Telegraph, which has an office and operator at the main camp.

The climate at the mines is not disagreeable. Spring opens about March 1, and from then on the weather is like early summer in California, until July 15, when the rains begin. Then until September 15 is a two months' rain, broken by a few good days. It is hot and steamy all the time. September to December 1 is ideal weather, and on December 1 the winter sets in cold and sharp, with little snow and the extreme of cold 30° below. The average low temperature mark is probably 8° below for a normal winter.

### Clearing Powder Smoke From Mine Workings by Engine Exhaust.

TO THE EDITOR:—Having occasion to call into use some mechanical method of clearing prospect workings of powder smoke, the exhaust of a gasoline engine used for hoisting suggested itself as a possibility in that way. Some 2-inch steel casing was procured, a 2-inch tee was placed in vertical exhaust pipe just above the engine, a short piece of 2-inch pipe was bent to about 24° from horizontal, and the casing was attached to this with plain coupling, one end gas and the other casing thread. The casing was carried upward at this angle some 30 feet to the air pipe from underground workings. At the head of the gallows-frame the air pipe has a diameter of 6 inches, which at this point was enlarged to 8 inches for a length of 2 feet to compensate for reduced space by the presence of the exhaust pipe. Here the exhaust pipe was by a bend back to horizontal carried through the side of enlargement and elbowed upward centrally to the air pipe. A short nipple was screwed into the casing, the casing was suspended by hangers at suitable intervals between the air pipe and the engine, while at the upper end of enlargement of air pipe one joint of 6-inch air pipe was added, making the arrangement complete. There had been some little apprehension that this length of exhaust pipe, with bends and couplings, might by added friction impair the efficiency of the engine, but this was not the case, at least to no harmful extent.

From the top of the gallows-frame to the bottom of the shaft is 150 feet, and from the bottom of the shaft to the end of the drift 120 feet. With full load the engine showed no weakness and the induced current of air through the pipe was full and strong. While the sharp shot of the engine set up a pulsating

Gate at Anjou, on China-Korea Boundary.

Oriental G. M. Co. Mill and Buildings at Tabowie, Korea.

structed. A cyanide plant is treating the concentrates from one mill, and a second cyanide plant is being constructed at one of the other mills. The concentrates from the third mill are shipped to American smelters. At only one of the camps is the ledge capable of being worked by tunnels, shaft mining being necessary on the others.

The labor is all done by Chinese, Koreans and Japanese. Underground, some claim that the Chinese make the best single-hand drillers, while others prefer Koreans. There are some Korean miners who

miner in Korea is not only to plan his work, but to keep a constant lookout to see that it is executed as he plans it.

Drill and pick sharpening is also done by Koreans, and to shape a drill properly is apparently one of the things it is impossible to teach a native. The rock is not very hard on drills, as a rule, but a bull-nosed bit is invariably the result of the Korean's work. They seem to lose sight of the cutting qualities of a bit in their anxiety to get one they can be sure will not break.

The methods of milling do not differ materially from those practiced in the United States, except

\* See illustrations on front page.

vacuum in the upper portion of the pipe, this by the elasticity of the long column of air in the pipe was reduced at the lower inner end to a steady inflow. The whole arrangement cost about \$9 and my own work in fitting.

W. D. LINTON.

Wadsworth, Nev., Oct. 26.

## Late Gold Dredging Practice.\*

Written for the MINING AND SCIENTIFIC PRESS  
by RALPH L. MONTAGU.

Gold dredging had been carried on successfully on a moderate scale in New Zealand for some years before the installation of the first successful dredger in the United States. Various machines had been set up in different parts of the country, but from one cause or another they were not a financial success. In some cases there was not sufficient gold in the gravel to make the work profitable; in others, the gold was so fine that it could not be saved; but in the majority of cases the machinery was either too lightly constructed or the final disposition of the tailings had not been sufficiently provided for.

Among other of the earlier attempts, in the autumn of 1894 a company was organized to dredge the bed of Grasshopper creek, near Bannack, Mont. The ground had not enough grade to sluice, and, owing to the nature of the gravel, drifting was considered very dangerous. The company acquired a group of claims lying along the creek and a mining ditch that extended to within about 3 miles of the property. By extending the ditch a head of 348 feet was obtained, and a Pelton water wheel and dynamo were used to obtain power for the dredger.

Bannack was the scene of a mining excitement in the early '60s, the bars on either side of the creek were mined and \$20,000,000 was taken out by the simple methods then in use; the bed of the creek and the bottom land adjoining were not touched, with the exception of a few isolated places where drifting was tried, but not very much was accomplished, owing to reasons already given.

The dredger, which was built by the Bucyrus Co. of South Milwaukee, Wis., was of the elevator type, and consisted of a chain of alternate buckets and links capable of excavating to a depth of 25 feet. The buckets had a capacity of 5 cubic feet, and the gravel elevated by them was dumped into a short rotating grizzly having openings 5 inches in diameter. A stone chute carried the boulders overboard, the screened material dropping into a hopper, from which it was elevated and dumped into the sluice box by a second chain of buckets.

The water for sluicing was obtained by means of a 12-inch centrifugal pump. The sluice boxes were supported on cables extending across the creek. The dredger was built during the spring of 1895 and began operations during the latter part of June. It is believed that a description of the numerous difficulties that were successfully encountered and overcome will be useful to those who contemplate dredging, as they indicate points to be avoided.

The first trouble arose from the power house. The Pelton water wheel, which was placed inside a cast iron casing, was not given sufficient clearance; consequently, when the full stream of water was turned on, and when the throttle valve was wide open, the dead water, instead of falling from the wheel, was carried around inside the casing, and, acting as a break, lowered the speed of the dynamo. This reduced the voltage, and, acting on the motor that drove the centrifugal pump, reduced the speed below a point at which it was possible to lift water. The trouble was remedied by removing the casing from the pump and by lengthening the shaft that carried the water wheel. This placed the bearings further apart and allowed sufficient clearance.

The secondary chain of buckets that elevated the screened gravel from the hopper to the sluice box next gave trouble. It was found that the buckets on the under side of the ladder rubbed against the enclosing case. The hopper was not large enough, and the chain was driven from the bottom tumbler. This difficulty having been overcome, it was found that the arrangement for supporting the sluice boxes was not of sufficient stability. This was counteracted by supporting the sluice box from the under side of a restle. Differential chain blocks were used to regulate the grade. This arrangement was finally changed to an auxiliary flatboat that carried the sluices.

Some of the motors on the dredger were overloaded and their armatures burnt out; this caused further delay. But the greatest disappointment was the fact that bedrock was not reached at 25 feet. This would not have happened if the ground had been prospected before the dredger was built. Bedrock (35 feet) was finally reached at the end of the first season (1895) by excavating a pit as deep as possible, lowering the water level and then excavating farther. This necessitated handling the gravel twice in some cases.

The results obtained from the gravel taken from near bedrock were found to warrant a further expenditure, and during the following winter the dredger was changed, so that it was possible to dig to a depth of 35 feet below water level, and various minor changes were made in other parts of the machinery.

In the spring of 1896 this dredger commenced ac-

tual work, and, with the exception of temporary delays caused by the breakages, it has been in successful operation ever since. Further on, in considering the various types of dredgers, the final development of this machine will be shown.

**ECONOMIC ADVANTAGES OF DREDGING METHODS.**—Throughout the mining districts of America there are various deposits of gold-bearing gravel that cannot be successfully worked except by dredging. In some cases a scarcity of water and insufficient grade prohibit ground sluicing or hydraulicking. In California the anti-debris laws prevent hydraulicking unless a restraining dam is built to hold the tailings. This adds considerably to the cost of mining.

A dredger will work successfully on a perfectly flat piece of ground and needs only enough water to counteract evaporation and seepage. It may be said that a dredger creates an artificial grade by elevating the gravel to a point from which it can be sluiced back into the cut from which it was excavated.

A dredger can work the bed of a large river, which if attempted any other way would need wing dams, pumping and other expenses to add to the cost of mining.

Where there is sufficient volume of water with head enough to hydraulic successfully, the same water power if applied to water wheels and dynamos will generate enough power to drive a dredger or dredgers that would handle 2½ times as much gravel as could be done by hydraulicking.

Hydraulic placer mining appeals to the investor on account of its simplicity of operation and its apparent economy; but in the majority of cases, when a pit is worked out the entire plant has to be moved into a new position to handle further gravel.

This amounts to a periodic expense of considerable magnitude, whereas a dredger when once in operation does not call for more expenditure than enough to renew and repair parts that wear out. A dredger will handle ground quite as economically as can be done by hydraulicking; but no dredger has been able up to the present to clean bedrock thoroughly where the bedrock is hard and cut up by deep crevices. Where the bedrock is soft, of clay-like consistency, and rotted and broken to shallow depths, it can be cleaned thoroughly with the right type of machine.

As a rule, dredgers are "cleaned up" every week, in some cases oftener. This, compared with the clean-up of a hydraulic mine at 30-day or season intervals, is a decided advantage.

Dredgers are working now in deposits of gravel that are 45 feet deep. At depths over 60 feet the extra cost of a machine and the difficulties to be overcome in the construction of it are such as to practically prohibit dredging at this depth, except where the deposit is very rich and will pay the added costs.

Dredging is technically a satisfactory method, because self-contained. The entire plant is at all times under the eye of the operator.

Before putting a dredger on a piece of ground, it should be, of course, thoroughly prospected.

A Keystone drill seems to be the preferred apparatus for this work.

The ground is surveyed into square plats of equal area and a hole is put down at the corner of every square. An average should be taken from every hole, the mean depth to bedrock ascertained, and from these results one can determine approximately the value per cubic yard and the total amount of gold in the deposit.

The physical character of the gold should be determined and carefully considered, since the commercial success of the investment rests on the ability to save the gold.

I would advise, in addition to the drilling prospecting, the sinking of several shafts to bedrock in order to better determine the nature of the gravel, and to get an idea of the size of the boulders. One type of dredger that is successful in light gravel may be inefficient and useless in a coarse gravel with large boulders.

The lowest cost at which ground has been handled by a dredger is 6 cents per cubic yard; this included operating expenses, repairs, management, depreciation of plant and official expenses. This degree of economy was only reached after several years of practical work and experimenting to get the best efficiency obtainable from men and machinery.

I do not wish the investor to expect that every dredging proposition can be handled on those terms. If, at the end of a year's run, it is found that the repairs and operating expenses are as low as 6 cents per cubic yard of gravel handled, the result can be considered very good.

The first cost of a dredger has a certain ratio to its capacity. Other conditions being equal, a dredger that would handle 4000 cubic yards per day would cost considerably less than the cost of two dredgers to handle 2000 cubic yards each in the same time. The cost of handling the gravel in the first case would also be less per cubic yard than in the latter case.

A large tract of low-grade ground might be profitably handed by a company who put in a number of large machines capable of handling on an average 5000 cubic yards per day per dredger; whereas if the same ground was cut into smaller lots, each owned by a different company operating dredgers at from 1200 to 2000 cubic yards per day, the various invest-

ments might barely pay expenses. This is the commercial condition that requires advance consideration.

On the whole, however, there is no other class of mining investment where there is a smaller element of chance. With the ground prospected thoroughly and the proper class of machines installed, success is assured. The product gold is the standard of value and is not affected by the commercial disturbances that affect other values.

The ideal dredging proposition can be defined as a deposit of gravel, not over 35 feet deep, overlying a soft bedrock, with about 20 miners' inches of flowing water on it. There should be little or no timber or brush on the land. There should be not more than 5% of the gravel composed of boulders, the largest not to exceed 400 pounds. The gravel should average 25 cents or more per cubic yard throughout in gold, which is coarse and evenly distributed from top to bottom through the gravel. Cheap electric power or cheap fuel would complete the favorable conditions. If there was more water in the stream than 20 inches it would be immaterial.

The other factors mentioned all bear directly on the cost of mining. Timber has to be cut down and stumps in some cases must be blasted out. Brush and roots have to be pulled out of the buckets as they come up, or else they will choke the screening apparatus. Coarse gold is easier saved than fine, and the gravel containing it need not be screened so fine; this makes a small saving in the power required.

Where there are a large number of boulders in the gravel, the buckets have to be made heavier; they cost more and take more power to operate.

Very few places will be found to entirely conform with the ideally desirable conditions; but a considerable divergence from these conditions is possible before the proposition would become unavailable.

(TO BE CONTINUED.)

## Gold and Silver Production for the Year 1900.

Director Roberts of the Mint has prepared a statement showing the production of the precious metals for the calendar year of 1900. It shows that the production of gold in the world that year was 12,457,287 ounces, of the value of \$257,514,700—a loss in value of \$49,070,200 from 1899. The loss was mainly in the Transvaal field and due to the war. The production of South Africa in 1899 was of the value of \$73,277,100 and in 1900 \$9,671,000. The principal gains were \$8,118,000 in the United States and \$6,600,000 in Canada. The United States again heads the list. In the United States the principal gains were by Alaska, Arizona, Colorado and Utah.

The silver output of the world amounted to 178,796,796 fine ounces, the largest ever known. It exceeds the product of 1899 by 11,572,513 ounces. The United States again leads all other producers, with a slight excess over Mexico.

The production of gold in States and Territories producing the largest amounts is estimated by the director as follows:

|                   |             |
|-------------------|-------------|
| Alaska.....       | \$8,171,000 |
| Arizona.....      | 4,193,000   |
| California.....   | 15,816,200  |
| Colorado.....     | 28,829,400  |
| Idaho.....        | 1,724,700   |
| Montana.....      | 4,698,000   |
| Nevada.....       | 2,006,200   |
| Oregon.....       | 1,694,700   |
| South Dakota..... | 6,177,600   |
| Utah.....         | 3,972,200   |

The commercial value of silver in the States and Territories producing the largest amounts is as follows:

|               |             |
|---------------|-------------|
| Arizona.....  | \$1,872,210 |
| Colorado..... | 12,700,018  |
| Idaho.....    | 3,898,062   |
| Montana.....  | 8,801,148   |
| Utah.....     | 5,574,912   |

## The chief countries producing gold are:

|                              |              |
|------------------------------|--------------|
| United States.....           | \$79,101,000 |
| Mexico.....                  | 8,900,000    |
| Canada and Newfoundland..... | 27,904,100   |
| Africa.....                  | 9,671,700    |
| Australasia.....             | 74,260,000   |
| Russia.....                  | 20,145,500   |
| Austro-Hungary.....          | 2,141,700    |
| Colombia.....                | 1,809,500    |
| Brazil.....                  | 3,330,300    |
| Venezuela.....               | 1,089,500    |
| British Guiana.....          | 2,035,900    |
| French Guiana.....           | 2,241,300    |
| Peru.....                    | 1,085,200    |
| China.....                   | 5,574,400    |
| Korea.....                   | 4,500,000    |
| British India.....           | 9,433,500    |

The commercial value of silver in countries producing the largest amounts is as follows:

|                              |              |
|------------------------------|--------------|
| United States.....           | \$35,741,100 |
| Mexico.....                  | 35,611,400   |
| Canada and Newfoundland..... | 2,578,200    |
| Australasia.....             | 9,703,400    |
| Austro-Hungary.....          | 1,233,000    |
| Germany.....                 | 3,361,300    |
| Spain.....                   | 1,974,900    |
| Bolivia.....                 | 6,723,600    |
| Chile.....                   | 2,947,900    |
| Colombia.....                | 2,183,400    |
| Peru.....                    | 5,295,200    |
| Japan.....                   | 1,029,400    |

### A New Electric Chain Coal Mining Machine.

A coal cutting machine now manufactured by the Sullivan Machinery Co. of Chicago, Ill., is claimed to be an entirely new departure along this line and promises results which a short time ago would have been considered impossible.

It combines in one machine both the breast and longwall types and is of simpler construction than the ordinary machine. The sumping cut in the room is made, as shown in Fig. 1, similar to the breast machine, and from its position at that point, without being moved or reset, it cuts across the room, as shown in Fig. 2, traveling on its own base and propelling itself, no skids or track being necessary.

The superiority claimed is in this arrangement, for if the time used in the operation of the ordinary breast machine is divided into three parts—one-third for the feeding process, one-third for backing out and one-third for moving and resetting—it is doing actual work only one-third of the time; while in the case of the Sullivan machine there is no resetting from the time of its first advance until it is withdrawn after it has undercut the entire face.

One of the greatest advantages claimed for this machine is that there is practically no heavy labor connected with it. It is loaded, unloaded and moved about the room by its own power.

Owing to the construction of this machine, it holds itself under the coal, while traveling across the face, without the use of jacks, saving the labor of the third man employed on longwall machines to shift the heavy jacks which hold the cutter under the coal as the machine advances.

In making its face cut, the Sullivan machine advances by means of a feed chain, the extremities of which are fastened on opposite sides of the room, the machine starting at one corner and pulling itself toward the other extremity of the chain. The depth of undercut is controlled by the runner by simply tightening or loosening the feed chain by means of the special jack.

For work in hard or soft coal it is necessary to have the machine equipped with several sets of feed gears, the hard formations requiring a slow feed. These feeds run from 14" a minute in hard coal to 42" a minute in soft. For instance, if the machine is provided with a 6-foot cutter bar, in one minute's operation with the feed at 42" a minute it will cut 21 square feet of coal.

What is claimed by the manufacturers as the world's record for coal cutting was recently made with this machine in the Dickason mine at Linton,

### A Swinging Ore Bin Gate.

Written for the MINING AND SCIENTIFIC PRESS by D. E. BIGELOW.

The ore bin gate illustrated herewith has been found very convenient, particularly for filling cars under ground, in narrow tunnels, where there is little room for the operating gear of other forms of gates.

Owing to the position of its point of support, the weight of ore upon it assists in closing it and holding it closed; and as it displaces no ore as it swings about its bearing, it is very easily opened.

Sheet iron of No. 8 or 10 gauge is heavy enough for any ordinary size, as its circular form and the way it is supported nicely resist the strains coming upon it.

Simple of construction, it may be made in an hour at any mine and as easily put in position, or transferred from an abandoned chute to a new one.

### Relation Between Engineer and the Laws of Nature.

The relation between the engineer on the one hand and the laws of nature on the other is unique, and differs from the relation that exists between any other professional man and nature. Unlike the geologist, who is limited in his observations to those favorable localities which nature has been kind enough to unfold for his inspection, or the biologist, who must stand merely as an observer of nature's acts, the engineer pins nature down and forces her to answer his question. It may be only a yes or no, but it is an answer;

organic nature. He alone of all professional men has an unvarying criterion by which he may decide the right and the wrong, the correct and the false. He gets accurate data by which he may build his bridge, construct his dynamo or lay out his railroad. Departure from these data means failure. Other professional men are subject to varying human laws and human notions, and so get along without ever having before them an absolute standard; but the engineer is forced to be in harmony with natural laws, his work must be absolutely truthful, his logic must be without flaw. Sophistry and ignorance are not for him. He must know, and know accurately; he must reason, and reason logically. If he does not know the stresses in his bridge, the endurance of his material or the details of his dynamo, he cannot rank as an engineer. Nature, calm and dispassionate, is always on guard over him. No other man in the world, I believe, unless it is the chemist or physicist, is subject to such rigid and unceasing discipline; no man's errors are so glaringly brought to light as his. The lawyer can fall back on the plea that the judge was biased or the jury packed; the doctor may, perchance, bury his mistakes; but the mistakes of the engineer bury him. We accept his success as natural, because it is in harmony with nature's laws; his errors are glaring, because they are out of harmony with nature. All the world sees his failures. A mere tyro can recognize a poor roadbed, defective machinery or a dangerous bridge. The engineer has then for his ethics the most dignified and exalted standard; he has an absolute and unvarying criterion for truth and error; he has over him a judge who will decide with unerring swiftness that his work is a failure if he violates the law.—V. C. Alderson in Armour Inst. of Technology Year Book.

THE requirements for admission to the Colleges of Mechanics, Mining and Civil Engineering of the University of California at Berkeley have again been raised and will go into effect in 1905. The change will require that all applicants for admission must have concluded a course in geometrical drawing, representing one daily exercise a week for one school year. The requirement calls for continuous training in the use of drawing instruments, in the solution by graphic methods of such geometric problems as shall emphasize the necessity for accuracy and neatness. In connection with this there must be a continuous treatment in the Reinhardt system of free hand, lettering and round writing. The course should be a general one, affording preparation for technical drawing, as taught in the Colleges of Engineering, as well as for the purposes of business life. Also for the Colleges of Engineering there will be required two subjects from this list: Latin, Greek, English, French, German, of which one must be French or German. The colleges affected are the most popular at Berkeley and have become too crowded for efficient work.

A Swinging Ore Bin Gate.

FIG. 1.

FIG. 2.

Ind., where a run of 360' 6½-foot undercut was finished in eight hours. During this run the machine was moved to six different faces and operated from start to finish by only two men.

and since he can vary his questions—that is, the conditions of his experiment—he can ultimately get the information he desires. He deals with the immutable, the unchanging laws of in-

## Mining and Metallurgical Patents.

Patents Issued October 22, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

WATER WHEEL.—No. 684,800; W. A. Doble, San Francisco, Cal.

A reversible tangential water wheel having a series of oppositely faced buckets, faces similar and of double ellipsoidal form, a transverse wedgelike bottom common to both, wedgelike partitions on each face in central plane of wheel, in combination with a branched nozzle, each branch curved from normal to discharge tangentially to pitch line of centers of buckets, oppositely to other, and a movable spindle-shaped core piece in each branch, with stems and balancing pistons, each branch having a converging lip surrounding core piece, whereby discharge jets are made to impinge on buckets in unbroken section.

GOLD SEPARATOR.—No. 685,005; A. R. Palmer, Oakland, Cal., assigned to the firm of Palmer Gold Separating Co., Oakland, Cal.

This invention consists of a revoluble vertically disposed cylinder adapted to contain mercury or amalgamated or silvered plates having an inwardly projecting flange around the top to prevent the overflow or escape of the mercury while allowing the lighter material to constantly flow over and be discharged. The bottom of the cylinder is so constructed that the material delivered therein will be carried outwardly and upwardly by centrifugal force and by overflow caused by constant additions from the feed apparatus which delivers the material centrally into the bottom of the cylinder. Water is added to the mass in suitable quantities and by means of a proper overflow any portion remaining in the apparatus after it is brought to a state of rest may be washed out through this discharge.

PRESSURE REGULATOR FOR PUMPS.—No. 684,806; K. Enzinger, Worms, Germany.

A pump cylinder and valved suction and delivery pipes, a chamber in open communication therewith having interior capacity equal to interior effective capacity of pump cylinder, a diaphragm in chamber, means for applying pressure on side of diaphragm, opposite communication with cylinder, whereby diaphragm may yield when liquid discharge rises above predetermined pressure, and means whereby pressure in rear of diaphragm is kept from increasing

as diaphragm recedes, whereby upon increase of pressure of liquid discharge pump is at once rendered inoperative.

PROCESS OF PRODUCING LIME OR CEMENT AND COMBUSTIBLE GASES.—No. 685,064; A. L. Schutert, Sacramento, Cal.

Passing heated products of combustion of burning fuel through a mixture of raw cement and carbonaceous fuel, thereby expelling all gaseous matter and vapors of water, clinkering partially burned cement by burning residual combustible matter, and subsequently passing all products of combustion of burning fuel, together with all gaseous matter and vapors of water, from mixture of raw cement and carbonaceous fuel, through a body of highly heated fuel.

ORE GATE.—No. 685,153; A. M. Levin, Wilkesburg, Pa.

A chute having bottom curved in cross section, an upright gate journaled above center of chute and rotatable transversely thereof, journal being adjacent to upper edge of gate, which is straight, with edge of lower portion of gate curved complementary with chute.

CENTRIFUGAL PUMP.—No. 685,167; G. McKay, Newport, R. I.

An annular fluid passage provided with central inlet at opposite sides and outlet, shaft extending transversely of fluid passage, blades extending radially from shaft to revolve throughout extent of fluid passage by rotation of shaft, blades being curved and narrowed in width toward their free ends, and fluid passage being contracted from inside outward to present at periphery an area equal to outlet pipe, curvature and shape of blades and narrowing of fluid passage giving a constant and equal pressure to fluid at all parts of passage over blades.

ELECTRIC MINE LOCOMOTIVE.—No. 684,950; C. Robinson, Columbus, Ohio.

The axles A, A', arranged relatively close together, motors arranged between ends of car frame and axles, gearing connecting armatures of motors with axles, a casing inclosing parts and forming a centrally arranged depressed chamber or compartment between axles, chamber being of such form as to provide a seat above each axle, a rotary trolley support or base on one side of central chamber, a corresponding support or base on opposite side of chamber and devices for controlling both motors and brake mechanism arranged within compartment, within reach of operator seated on either seat therein.

AMALGAMATOR.—No. 685,184; H. M. Smith, Libby, Mont.

A skeleton frame, a pan supported in frame, a table, a bolster secured to frame and mounted to slide on lower portion of table, a bolster for upper end of frame consisting of removable sections, bolts for securing sections together and to frame, and means for imparting lateral sliding movement to frame.

Some Recent Additions to the Collections of the California State Mining Bureau.

Fine specimens of azurite and cerrusite from New Mexico.

Native mercury on crystallized calcite, Marfa and Mariposa mines, Terlingua, Texas; Montroyd Sharpe.

Quicksilver ore, St. John mine, Solano county, Cal.; Alf. Tregidgo.

Asbestos, Hazel creek, Shasta county, Cal.; Benj. F. Miller.

Rich silver ores, with gold, La Palma mine, Durango, Mexico; Dr. G. E. Davis.

Spinel (gem variety), Ceylon, India, and fine tourmaline crystals, Mesa Grande, San Diego county, Cal.; A. E. Heighway.

Very handsome blue marble from a new locality, near Riverside, Riverside county, Cal.; Kretek & Vertiska.

Gold quartz, showing free gold, Blood mine, near Murphys, Calaveras county, Cal.; P. E. Condit.

Native mercury with cinnabar, vanadinite and pyromorphite, and cinnabar with included fragments of charcoal, Marfa and Mariposa mines, Terlingua, Texas; Montroyd Sharpe.

Halite (rock salt), of exceptional purity, Virgin river, Lincoln county, Nev.; J. Bell.

Rich auriferous pyrite and free gold, Thunder mountain, Idaho; G. W. McAllister.

Quicksilver ore, Elgin mine; Sulphur Creek, Colusa county, Cal.

Concretionary hydromagnesite, Bolinas, Marin county, Cal.; Robert U. Collins.

Very rich silver ores, (called by the Mexicans "petanko"), mines of the La Dura M. & M. Co., Sonora, Mexico.

Auriferous gravel, showing free gold and gold washed from it, Kunz hydraulic mine, Klamath river, Siskiyou county, Cal.; J. S. Lowden, Jr.

Gold quartz, Bull of the Woods mine, near Summer-ville, Trinity county, Cal.; J. Liebrandt.

Copper ores from seventeen new mines and prospects in California. H. S. DURDEN, Curator.

## The Mother Lode of Atlin, B. C.

The country rocks from the northeast shore of Atlin lake to a little north of Boulder creek and east and west from McKee to Monro mountain are magesian eruptives, principally a hard, green diorite. This hard diorite seems to be cut diagonally by a belt of soft, decomposed magnesite, interlaced by bands of serpentine; the width of this belt has not yet been determined, but its course seems as follows: Beginning at Boulder, it runs south, cutting Birch, crops again at Pine, keeping the valley, down to Stevendyke, where it seems to leave Pine, crossing Spruce, and here heading for McKee creek. In crossing the divide from Spruce to McKee, coming from the direction of Boulder, the same rock formation may be found and followed across McKee, losing itself in the slate formation east of the creek.

This mineral-bearing magnesite is cut diagonally by quartz veins, which seem to have a northeasterly strike, and dips 60.20 east. The country rock for many feet on each side of the vein seems to be impregnated with mineral with values in free gold sufficiently high to pay handsomely for milling. So far as the prospecting work has been done on Pine creek rich bodies of rock have been shown, and in cross-cutting the ledge matter the extent of the pay has not yet been determined, although the cuts have been run some 30 feet. The strike and dip of the new find on Pine is the same as that of the Yellow Jacket and the vein has the same characteristics. Above the Yellow Jacket the same rock has been found carrying values, and here seems to strike undoubtedly in the direction of Gold Run. Although no vein has been discovered as yet in this vicinity, we believe some will be during the winter while drifting for placer, as quite a proportion of the placer gold taken from Gold Run is sharp, having in many cases the same quartz attached.

One cannot help but observe that wherever a creek has cut through the above-mentioned body of magnesite rich values have been found in the adjoining placer claims, showing plainly that the wear and tear of the water has simply done the milling of the rock, depositing the gold below.—The Atlin Claim.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ALASKA.

#### JUNEAU.

The Mammoth and Jackson quartz claims at Snettishan, owned by C. Morse and S. Kohn, have been bonded to G. Bach of Juneau. A lower tunnel is in 150 feet and an upper tunnel is in 125 feet. The vein is from 6 inches to 4 feet wide.

At the Rodman Bay mines the magnitude of the ore body is said to approximate that of the Treadwell mines at Douglas. Rodman Bay is about 60 miles from Sitka, in Baranoff island, and the mines are 8 miles from tidewater. The Rodman Bay Co., principally English capital, is the owner. The ore is low grade, but in great quantity. It is claimed that the mountain is a mass of low-grade ore, running from \$3 to \$4 per ton. Geo. Bent is manager.

#### ARIZONA.

##### COCONINO COUNTY.

Twelve asbestos claims in Grand Canyon have been sold by J. Hance, C. H. McClure and the heirs of W. H. Ashurst, of Williams, to S. W. Selfridge of New York for \$10,000.

##### GILA COUNTY.

T. G. Cockrill, of Platte City, Mo.; G. S. Watkins, W. N. Bowen and F. A. H. Garlicks, of St. Joe, Mo., officers of the Pinto Creek M. & S. Co., have been at the company's mine on Pinto creek to determine plans for the further development of the property. The Yo Tambien is now opened by a shaft, crosscut tunnel and drift to a depth of over 250 feet, and the buying of machinery necessary to develop to a greater depth is under consideration.

##### GRAHAM COUNTY.

Adjoining the Fleming Bros.' claims in the Galuria mountains there has been discovered an additional vein 30 feet wide which samples over \$25 gold to the ton. A half-ton sample, taken from all the ledges, shows much of the rock when crushed held together by wire gold.

##### MOHAVE COUNTY.

J. P. Jacobson of Minneapolis, Minn., president of the Arizona Northern M. Co., is in Kingman preparing to start up the Senator mill in Lost Basin. He has bonded several mines and purchased the Senator 20-stamp gold mill.

W. Grant and F. O'Dea have bonded the Gold Basin mill and the O. K. gold mine near Kingman.

##### PIMA COUNTY.

J. Quinn, in charge of the Grand Reef mine, near Solomonville, is said to have resumed work on that mine, making a general cleanup of the machinery and pumping out the water. This mine is owned by J. W. Mackay of New York.

##### YAVAPAI COUNTY.

M. J. Lester, who bought from G. W. Swartz, for \$10,000 cash, some placer ground on the Big Bug, has installed a steam shovel, that will handle 600 cubic yards of gravel per day, and other machinery, expending, it is stated, \$40,000 before starting up. The plant in operation is said to be a success; from a four days' run made recently \$4000 was the clean-up. Only seven men are employed and it is estimated that the expenses will not exceed \$50 per day. The plant installed is substituted for the Swartz plant of two men and two horses with which about \$100 per week net profit was obtained.

##### YUMA COUNTY.

O. A. Knox has bought for J. S. Jones of Colorado Springs, Colo., the Planet copper property on Bill Williams Fork of the Colorado river. This includes fourteen claims and five mill sites, and has belonged to O. Angsade for many years.

### CALIFORNIA.

#### AMADOR COUNTY.

The shaft on the Argonaut mine is down over 1900 feet. Ten stamps of the mill are kept running half time on ore from the south drift at the 1200-foot level. This drift, it is reported, has been run 2000 feet from the shaft into Hoffman ranch, lately bought by W. F. Detert for mining.

At the Kirkwood mine sinking has been resumed, to go 200 feet deeper, taking the shaft to a depth of 750 feet. At the 550 level a low-grade ore body was encountered.

#### BUTTE COUNTY.

Eastern people have secured control of the Catskill and Bishop mines, near Bangor. Pumping has been commenced on the latter.

#### CALAVERAS COUNTY.

At the Jones mine at Railroad Flat twenty-eight men are employed, sinking

the shaft and stoping out ore. The mine is owned by a Boston, Mass., company.

The Afterthought mine, near Railroad Flat, is being developed by its owners, with W. W. Cook Supt. A 2½-foot vein of ore that runs \$25 to \$60 to the ton is exposed. A vein of good milling ore 4½ feet in width is in the face of the tunnel. A mill test of 200 tons is being taken from the various shoots exposed.

At the Poorman mine, near Railroad Flat, a tunnel will be run 2500 feet from the south fork of the Mokelumne river to cut the vein 900 feet from the surface. The main working shaft is now down 360 feet and will be sunk to 600. A mill will be erected.

A San Jose company is opening up the Conrad gravel mine at Railroad Flat under B. Jennings, Supt.

The Oriental M. Co. has bought the Calaveras mine on Indian creek, near Murphys, and is now making preparations to build a 20-stamp mill. The cyanide plant is about ready for operations. The company is receiving bids for sinking the three-compartment shaft.

#### EL DORADO COUNTY.

Mr. Coles and Mr. Eastwood have already begun the rebuilding of the hoisting works at the Zantgraf mine, and hope to have it in operation within twelve or fourteen days. Work of construction on the new mill will be begun soon.

#### KERN COUNTY.

Supt. McMahon states that the Butte mine at Randsburg at its last milling of eighty-seven tons cleaned up \$5244, the average being about \$60 per ton. This ore came from the 375-foot level. The total production since June 1, 1900, has been \$73,500, average value per ton \$79.10.

The Yellow Aster Co. at Randsburg have ordered a new boiler at the Goler wells. Both mills are now running and are crushing 450 tons of ore daily. The total cost of the new 100-stamp mill, complete, is stated to have been about \$105,000.

#### MONO COUNTY.

S. G. Lines of San Francisco, president of the Alamo M. Co., operating in Antelope valley near Bridgeport, says that arrangements will be made for putting a mill on the property in the spring, if the mine continues to improve as it has up to this time.

#### NEVADA COUNTY.

(Special Correspondence).—The Girard M. Co. of Sacramento, operating in Meadow Lake district, have had a 4-stamp mill in operation all summer. Have been crushing about eight tons per day. This has turned out from \$40 to \$50 gold per day above all expenses, besides 20% (1.6 tons) concentrates per day, containing \$45 to \$55 gold. The company has lately added four more stamps and it is the intent to place hoisting machinery of greater capacity on the property and sink a new shaft. The Crystal Lake G. M. Co., Francis W. Breine of Philadelphia, manager, have built a boarding house 24x40 and an office building, and a 10-stamp mill is being erected by G. A. Nihell of Nevada City, which it is expected to start up by Nov. 15th. In connection with these operations, an Eastern company is erecting a rotary roasting furnace, using crude petroleum for fuel, the oil to be hauled 33 miles from Truckee. This furnace will be used to oxidize the heavy sulphureted ore before milling. The company has leased the Excelsior group (the Hartley mines) consisting of four claims. This group has a large body of ore which will average about \$7 per ton free and 15% to 20% concentrates going \$45 to \$70 per ton gold. These concentrates yield easily to chlorination or cyanide.

Cisco, Oct. 27. C. W. R.

The Red Cross mine at Omega, under bond to J. A. Brent, who has been developing it for several months past, has been leased by him to a company of working miners, who propose to continue operations.

C. Graham of Nevada City has interested San Francisco and Sacramento people in Shady creek on the San Juan ridge. The company has over 2 miles and will bond the entire creek as far as Cherokee, 4 miles in all. At the Phelan ground, flumes will be built to work this winter. It is proposed to work both the tailings and virgin ground by a system of undercurrents. Two lines of flumes will be built, one over the other. In the upper flume cast-iron bars will be placed, on which the gravel and tailings are deposited. The bars separate the coarse material, allowing the fine to run into the lower flume, the coarse debris being carried away. In the lower flumes quicksilver traps are provided, which will catch the fine gold which escaped with the debris from the hydraulic mines. Mr. Graham is superintendent.

The New Independent mine, at Moore's Flat, has been pumped out to a distance of 230 feet. All the machinery on the prop-

erty has been placed in good condition and development work has been commenced.

G. C. Sargeant of the Sargeant mine at Quaker Hill is superintending the construction of an impounding dam. The barrier will have a capacity of holding back a great volume of debris. As soon as it is completed a United States debris commissioner will inspect it and, if accepted, active work will be commenced for the winter.

The Ironclad mine, near Rough and Ready, was opened up many years ago and sunk to a depth of 180 feet, but excessive water encountered caused abandonment then. This mine and the Mistletoe mine are owned by a San Francisco company, headed by a Mr. Canfield. Under Supt. Hay these mines are now being reopened.

#### ORANGE COUNTY.

The Santa Fe Railroad Co. has just brought into flowing at Fullerton an oil well that yields 570 barrels of oil of 22° gravity in twelve hours. The flow is continuing without any signs of diminution. The well is 2000 feet deep—the deepest in the county. The hole is 16 inches in diameter at the top and 7 inches at the bottom. The company, it is said, values its new gusher at \$200,000.

#### PLUMAS COUNTY.

Gobert & Leshner have bought the Bushman quartz mill and will remove it to the Crown Point mine, near Quincy, which they have been developing. Whether it will run by water power or steam has not been decided.

#### SAN DIEGO COUNTY.

It is reported that the California King G. M. Co. has commenced actual construction on its projected plant at Picacho, near the Colorado river. The plant will have a capacity of 1000 tons of ore a day and will be largely automatic in detail. The plant includes a 5-mile railway from the mines to the mill. The mine will be provided with steam shovels, capacity one ton, and the cost of loading, it is anticipated, will not exceed 2 cents a ton after the ore has been broken down at an estimated cost of not more than 6 cents a ton, including blasting. The company, it is said, expects to mine and mill the ore at a cost not to exceed 75 cents a ton.

#### SHASTA COUNTY.

The semi-annual report of the Mountain Copper Co. shows a large increase made in the output of its mines and also that much lower grade ore is now being treated than formerly. The 172,782 tons of ore smelted in the six months ending June 30th last yielded an average of 94 pounds of copper to the ton, or 4½%. In the year previous 207,571 tons were treated, which yielded an average of 129 pounds of copper, or 6½%. In the whole of the year 1900 the Mountain Copper Co.'s output amounted to 26,850,880 pounds of copper. Its net earnings were \$1,458,000, or a little less than 6 cents for each pound of copper produced. On the basis of the first six months, its output for 1901 will be 32,565,120 pounds—about 30% more than now being produced by the Quincy mine at Lake Superior. It is claimed that the Mountain Copper Co. operated to a disadvantage last year by reason of the fact that its smelter was reconstructed and enlarged. Though its plant had a capacity of 750 tons daily, it smelted an average of only 575 tons. Its plant has been increased to 1000 tons daily capacity, and, according to its report, has treated an average of about 950 tons daily since the beginning of the present year.

G. Vanderbilt and J. H. Bryan of Dunsuir are building an arrastra on a gold quartz claim on Long gulch, near Dunsuir.

The Bully Hill Copper M. & S. Co. employs about 500 men in the mines and smelter. The smelter includes a Bessemer converter. The ladles, of a capacity of three tons each, are handled by a traveling electric crane. A main hoist, capable of handling twenty tons, lifts and carries the ladles and an auxiliary five-ton hoist tips the ladles for pouring. The engineer rides with the traveling crane. The entire plant is operated by electric power and lighted by electricity. The slag is broken up by an egg-shaped iron weight of perhaps 4000 pounds fastened to the auxiliary hoist. A hydraulic elevator runs up and down into the converter room. Very little smoke is noticeable. The furnace is a large-sized water-jacketed blast furnace. Three tons of matte is delivered from the furnace at each "tap." In the plant is a briquetting machine, of a capacity of 100 tons a day. Briquettes are composed of the fine ore particles, are round in shape and weigh four pounds. In the main furnace room, or charge floor, the briquettes are stacked to dry to the amount of 500 tons. In the smelter yard there are two 25,000-gallon water tanks, and sixty stall roasters and two mechanical roasters for finely divided ore. The stall roasters resemble coke ovens. All of the roasters are connected

by a flue with the main brick stack which carries off the fumes from roasters and plant alike. The machine shop is fully equipped and modern in every detail. The powerhouse is equipped with blowing engines and dynamo.

The Three Sisters gold quartz mine at French Gulch has been bonded by Ellery Bros. to V. Fox and D. Perano at \$10,000 for eighteen months. The bonders have started development work in the Grayson shaft.

A Keystone driller run by a traction engine is being operated on Clear creek, near Redding, by Postlethwaite & Loughborough of San Francisco. If the prospecting proves successful a dredger will be installed.

#### SIERRA COUNTY.

The Dudley mine at Forest City, owned by H. A. Greene of Los Angeles, is prospecting well again. Considerable dead work has been done and the bedrock has been broken through into the channel, which has widened out. H. Murray is Supt.

The Brush Creek and Ante-Up mines, situated near the Mountain House, have been bought by W. Corbin of San Francisco.

Sacramento people have obtained control of the Mohawk quartz mine, near Alghaney, and will open up the property at once. A hoisting plant will be installed and sinking commenced. Rock recently taken from the Mohawk paid \$16 to the ton.

#### SISKIYOU COUNTY.

The O. & C. quartz mill, near Henley, is being built rapidly by contractor G. W. Cooper of Yreka. The company, with C. W. Tyrer as manager, will start crushing ore.

A Cripple Creek company of Colorado miners is preparing to open up Ash creek below Henley and will put in an extensive flume.

H. Thompson and J. A. Hennessy say they will put up a 10-stamp quartz mill on the Meyer's mine, on Yreka Flats, which they have recently bought.

#### TRINITY COUNTY.

W. Montgomery states that at the mine owned by the Bob's Farm M. Co., at Rattlesnake, the largest ledge will average over 30 feet in width and the ore runs in free gold from \$3 a ton up. The mine is equipped with a 2-stamp triple discharge mill and an electric plant will be put in next spring.

At the Lucky Hall mine, at Hall City, the company has opened up a good shoot of ore. The mine was discovered by W. R. Hall, now of Carters, Tuolumne county, who is still interested in it.

The Lappin mine, near Lewiston, is reported sold to Pittsburg, Pa., people for \$110,000.

#### TUOLUMNE COUNTY.

Supt. Stayton of the Badger mine, near Rawhide, is developing a strong 4-foot vein of high-grade ore. A mill is proposed to be erected soon.

The Mohican mine, F. Chappellet Supt., on the main Tuolumne river, near Jacksonville, has seven tunnels on a vein, which is 6 feet wide in places. The lower tunnel, 30 feet above the river, is in 150 feet. The 5-stamp mill is nearly completed.

The Goldwin mine mill has started crushing ore. Supt. J. L. Partz says that sinking the shaft 100 feet deeper from the 500 has been commenced.

The Green Jumper M. Co. will soon resume work at their mines near Confidence.

At the Von Tromp mine, near Sonora, the stamp mill has been completed. Ore on the dump is estimated sufficient to keep the mill running for five months.

The John Royal M. & M. Co. have reconveyed to C. W. Troyer, A. E. Troyer, O. L. Anderson, J. T. Watkins and E. Watkins the John Royal quartz mine, near Columbia, the consideration not having been paid.

### COLORADO.

#### CLEAR CREEK COUNTY.

(Special Correspondence).—The Georgetown-Silver Plume district has been from the first a high-grade camp. During recent years the tonnage has not been great, but the values seem to keep up almost to their former grade. C. K. Wolf, manager of the Chamberlin sampler at Georgetown for the last twelve years, states that the ore handled by him at that point for 1900 had an average value of \$109 per ton. He also figures that the output of that camp for 1899 amounted to \$557 per capita of the adult population of the camp. In the district generally the leasing system prevails and operations go on with little friction.

The Mendota, Scepter, Smuggler, Stevens, Paymaster, Mineral Chief and Commonwealth are the principal mines in which the lead product exceeds the silver and gold, hence these are called the lead mines, though their ores run 15 to 50 ounces silver. The Dunderburg, Seven-

thirty, Bismarck, Pelican and Allunde produce ores which run very high in silver, and whose lead values also run well up.

McClellan mountain section, close to the Continental Divide, is known as the gold belt, the properties there being the Stevens, Huckleberry, Independence, Johnson, Mendham, Bullion, Commonwealth, Paymaster and Santiago. Their ores carry silver, gold and lead. The Waldorf Co. has 700 acres on the east slope of McClellan mountain, where they are running the Argentine tunnel westward, which is in 400 feet. On the opposite side the Stevens tunnel is being driven eastward to connect possibly with the Argentine.

The Red Oak Co., made up of Iowa people, are operating the Astor, Scepter and Sunburst, on Democrat mountain. A 1600-foot drift in ore that averages over 2 feet wide has been run on the Scepter. This ore is a lead sulphide which it is believed will make a 50% lead concentrate. It is also said that it will run fair values in gold and silver. The Astor is an old property, whose ore will be cut 800 feet below the old workings. A 2½-mile tramway runs from the mine to the new mill in the valley. The latter is undergoing some changes under the directions of J. G. Roberts of Idaho Springs. It is expected to be operating as a concentrator in a few weeks.

The Welch mine, after eighteen years idleness, is being reopened by L. R. Fry. It has ore that runs high in silver and well in lead. He has shipped a number of carloads.

The Sporting Times, on Griffith mountain, is being reopened by Iowa people, in charge of F. Schrott.

The Central Colorado, on Leavenworth mountain, carrying silver, gold and copper, is being developed.

J. Warren Brown of St. Louis, Mo., one of the stockholders of the Dunderburg, has large holdings on the right of the stream between Georgetown and Silver Plume, on Republican mountain. They have been idle ten years by reason of litigation, but were profitably worked prior to that time. The suits involved two groups—the Lebanon and the Republican mountain—which cover 2 miles of surface along the strike of the ore belt. The litigation has been terminated and Mr. Brown is on the ground presumably to reopen the properties. WASCOTT, Georgetown, Oct. 16.

#### DOLORES COUNTY.

There is a movement among Dolores county miners to consolidate readily workable contiguous groups of mines instead of operating by independent effort. This has been done in many districts to their advantage. At Rico the Pro Patria M. & M. Co., W. J. Scoutt manager, appears to be taking the lead in such work. It has twelve claims on Dolores mountain adjoining the Enterprise and Stanley mines. There is a main tunnel in 2700 feet, crossing fifteen veins. Its 100-ton concentrating mill, with electric power and electric separators, is under construction.

#### GILPIN COUNTY.

The Defiance G. M. Co. of New Orleans, La., is working the Defiance mine in Russell district, near Central City, under a bond, with W. S. Robinson as manager.

#### GUNNISON COUNTY.

The Citizen mine and Citizen group of claims in the Pitkin district, composed of twenty-two claims, have been sold by Mrs. J. L. Osgood of Denver to the Wallace M. Co. of Denver for \$32,500.

#### LAKE COUNTY.

In the rock-drilling contest at Leadville the prizes were divided as follows: First money, \$750, Malley and Chamberlain, Leadville, 40½ inches; second, \$350, Ross and McNichols, Rossland, B. C., 39½; third and fourth money, \$200 and \$150, respectively, divided between the tie teams, McKenzie and Make of Leadville and Davey and Freethy of Butte, Mont.

#### OURAY COUNTY.

H. Scott and R. Richards, while on the Tiffin lode at Cow creek, have opened up a large cave filled with lead carbonates, carrying silver chloride.

#### PARK COUNTY.

(Special Correspondence).—Schlessenger & Co. are operating the Last Chance mine, 17 miles west of Fairplay, on which they have a bond. This mine, which is a producer of siliceous silver-lead ore, is at an altitude of about 13,000 feet and is well developed. Recently a new vein has been opened. Some smelter shipments are being made; but most of the output is mill ore, and Mr. Schlessenger says a concentrating plant is to be built 2 miles from the mine at a point 3000 feet lower. Fairplay, Oct. 23.

#### SUMMIT COUNTY.

(Special Correspondence).—The Juniata group of twenty claims, located on Nigger hill, was acquired some time ago by Colorado Springs parties. It was considerable

of a producer in former years, and is now being reopened and re-equipped under the management of Mark Evans. Present work consists of a 780-foot tunnel that crosscuts several veins and a shaft at a higher point. The tunnel will be driven 200 feet farther to cut the Juniata vein, on which the shaft sinks. This vein is said to be opened for 2000 feet on its strike from the shaft. It is 245 feet vertically from collar of shaft to level of the tunnel.

The Mecca placers, on French gulch, have operated a portion of the season. It is stated that 288 yards of bedrock gravel yielded \$9 per cubic yard. This was taken from the old river bed, where there is 22 feet depth of gravel to bedrock. A new pipe line, 24-inch diameter, has been put in this season and Evans hydraulic elevators are being installed, with the idea of handling the material cheaper and more rapidly.

Most of the ore being shipped from Breckenridge is that of lessees operating on old properties on Farncome hill.

Breckenridge, Oct. 18.

(Special Correspondence).—The Summit M. Co., operating the Summit mine and Wilfey mill, in charge of E. E. Byron, are producing an iron, lead and zinc ore, having silver, lead and gold values. The same company have also fixed up the Excelsior mill at Frisco, which belongs to Ault & Wiborg, and will send part of their mine tonnage to it.

The Eagle mine, belonging to Peter Breene, is shipping sixty tons a day of sulphide ores. The mine is opened through a shaft down 200 feet vertical and 700 feet on pitch of the vein. A half-mile tram line delivers the ore from the mine to the shipping bins at the railroad near Kokomo.

Kokomo, Oct. 19.

Smith & Bradbury have put a force of men at work on the Mollie R. mine, near Breckenridge.

#### TELLER COUNTY.

C. M. Clinton of Denver has taken a two years' lease at a 20% straight royalty on the middle block of the Golden Wedge claim of the Mary Jane Co. at Cripple Creek. He intends to sink a shaft from the surface and install a steam hoisting plant.

#### IDAHO.

Parties arriving at St. Anthony from Henry's lake report the discovery of gold found in what is termed rotten granite in the hills about 3 miles south of Dwellah. Samples of the stuff brought here are said to run from \$1.50 to \$100 gold per ton. About 2 miles of ledges have been staked, and between thirty and forty men are camped in the locality, building cabins and preparing to work during the winter.

#### ADA COUNTY.

The Elmore group, near Boise, has been sold to A. L. Morris of Boise and H. A. Smith of Salt Lake City.

#### IDAHO COUNTY.

W. A. Stevens, manager of the Buffalo Hump Co., has bought one-third interest in the Cracker Jack mine in the Hump district. The consideration is the completion of 250 feet of drifting upon the south vein and the installation of a complete 10-stamp milling equipment upon the property.

W. L. Farnsworth of Lewiston says Newsome creek district is showing well. The Tim Conley ledge is widening with depth and the high values continue. An arrastra has been started and it is reported that a daily cleanup of \$500 is being made. The N. P. M. Co., of which Mr. Farnsworth is one of the directors, is now ready to install a mill. About 250 feet of work has been done and on the lowest level the ledge showed 3 feet of \$100 ore.

#### SHOSHONE COUNTY.

A 20-ton carload of gold ore has been shipped from the mines of the Etruscan G. M. & M. Co., near Murray, to test the ore for the best method of treatment. The company has determined to build a 20-stamp mill on the ground. J. Johnston is manager.

The Snow Storm M. Co. has reached the ledge, 500 feet in the crosscut tunnel. The footwall rock shows copper minerals and was mistaken for ore. On the level 530 feet above the tunnel the ledge showed 12 feet width of ore where it was cut. In the tunnel is 37 feet all ore except 2 feet on the hanging wall. The ore is said to run over 7% copper, 12 to 18 ounces in silver and \$2 to \$3 in gold. No process has been determined as to the method of treatment, but the selection of a leaching process is considered likely. The mine was originally located years ago and a shaft sunk 80 feet in ore all the way down, but the property was abandoned, then relocated, the new owners shipping from the old dump a carload of ore that considerably more than paid charges.

#### WASHINGTON COUNTY.

(Special Correspondence).—The Heath

M. Co. has decided to erect a concentrating plant on its mine in the Heath district, development of the mine having been in progress for several months. The company has water power which will be utilized in generating electric power to operate the mill, compressor and for lighting. Buildings have been erected and operations will continue through the coming winter. McKinney & Hall of Welser are local managers, the principal stockholders being in New York, Philadelphia and Erie, Pa. L. S. Welser, Oct. 27.

The Copper Queen M. Co., Ltd., has been incorporated in Idaho, with office at Pocatello and \$500,000 capital. The incorporators are E. E. Calvin, F. Dunn, J. L. Craig, A. C. Heald, W. G. Lane, E. Purcell, G. H. Olmstead and F. S. Deltrich. The company owns three copper claims—the Herald, Athens and Ridgeway—in the Heath mining district, 16 miles from Cambridge, on which development work has been done.

#### MONTANA.

##### FERGUS COUNTY.

The new mill plant of the Barnes-King mines at North Moccasin is crushing 110 tons of ore daily. Recent development work in the mines has exposed an immense amount of ore, which is now being broken from an open cut and passed through chutes into the cars below. At present only four miners are employed in breaking the 110 tons of ore.

Work on the plant of the Kendall Co. at North Moccasin is progressing. The excavations are completed and a part of the framework has already been raised. H. H. Lang is in charge of the construction and states that the mill will be ready about the first of the coming year.

#### NEVADA.

##### ESMERALDA COUNTY.

The Consolidated Esmeralda Co. has been incorporated under Arizona laws to operate the Pamlico mine, owned by W. D. Tobey, D. L. Bliss, J. A. Yerrington and J. Forbes of Carson City.

##### HUMBOLDT COUNTY.

The American Niter & Potash Co. has made a shipment of three carloads of niter to San Francisco from its works near Lovelock. Two carloads of niter and two of salt will also be shipped.

##### LINCOLN COUNTY.

Control of the April Fool M. Co.'s mines and mill at De Lamar has been bought by a Salt Lake City, Utah, and Montana syndicate, headed by S. Bamberger and J. D. Wood, on a basis of about \$100,000 for the whole. The company's management has been reorganized with W. S. Godbe of Salt Lake City as president, S. Bamberger treasurer and D. L. Wertheimer secretary. With these officers, R. Lieber and J. B. Leggat of Butte, Mont., will be directors. E. Godbe has taken charge of the mine as manager.

J. Chisholm of Salt Lake City, Utah, is preparing to develop sulphur deposits of great extent. According to a report from T. W. Forrester, they are close to the grade of the proposed railway through Lincoln county. The beds are said to be capable of producing a large tonnage of almost pure sulphur, which can be mined at very little cost.

##### LYON COUNTY.

P. Gallagher, sinking on his gold discovery near the Mason Pass, is down 23 feet and the ledge has widened out to 3½ feet. On top the ore assayed from \$60 to \$100 per ton, and in the bottom of the shaft assays have been obtained that go over \$200 per ton.

##### WASHOE COUNTY.

W. H. Ivey of Washoe City has sold the Morgan mine and mill in Galena canyon to Salt Lake City, Utah, people, for \$15,000.

#### OREGON.

##### JACKSON COUNTY.

Reed & Fletcher, at Meadows district, near Jacksonville, have sunk a shaft 112 feet and cut a vein 11 feet in width which runs well in canabarr. —The Rogue River Quicksilver M. Co. has men at work sacking ore, which is growing richer with depth. —Hammersly & Chisholm are steadily working on their claims, as are also Chapman & Co.

F. Kauster, who has been working his quartz claims on Foothills creek, near Ashland, is having a crushing made at the custom mill at the latter place. The ore shows coarse gold.

J. H. Bagley has bought the Noah Bowers group of eight placer claims on Ward's creek from J. Wimer & Co. W. A. Corthell of Ashland, H. Perkins of Central Point and T. Olsen of Gold Hill are interested with Bagley. The new owners will operate on a more extensive scale.

##### JOSEPHINE COUNTY.

W. F. McNeil's mine on the Chetco

river, 16 miles from Kerby, is equipped with a hydraulic plant. The gold obtained is nearly all coarse, heavy, smooth channel gold, though some rough gold is obtained.

A rich body of ore is reported uncovered at the Baby quartz mine, in Jump-off-Joe district. A 26-inch vein has been cut 80 feet in from the surface. The mine is operated by Meyers, Rice & Smith of Grants Pass.

#### SOUTH DAKOTA.

##### LAWRENCE COUNTY.

(Special Correspondence).—The Spearfish G. M. & R. Co.'s new 200-ton cyanide mill at Ragged Top was destroyed by fire this morning. The fire started in the lower part of the building. The origin of the fire is unknown, but is supposed to have caught from small boiler in the refinery corner of the mill; the building, being of wood, and dry, burned like tinder. The mill has been in operation less than a year; the operation has been quite successful and has shown that the immense ore bodies of Ragged Top will make one of our foremost cyaniding districts. The insurance was about \$25,000, but the loss will exceed \$75,000. The plant was complete, containing crusher, two pair rolls, six solution tanks, ten 125-ton leaching tanks, with precipitation boxes and refinery. Several thousand dollars can be cleaned up from the ruins, as the precipitating room was on solid ground. O. N. Brown, the general manager, is waiting instructions from the main offices at Colorado Springs, Colo. It is expected that they will rebuild to better advantage and on a larger scale. S. A. E. Deadwood, Oct. 26.

#### UTAH.

##### BEAVER COUNTY.

In the O. K. group, near Frisco, it is reported, a cave has been found on the 300-foot level, the dome, floor and walls of which are copper ores.

##### BOX ELDER COUNTY.

The Sunflower M. Co. has been incorporated, with office at Salt Lake City; capital, \$300,000. J. R. Browning is president and O. Morris secretary and treasurer. The company owns the Sunflower Nos. 1, 2, 3, 4, 5 and 6 and Sunflower Extension Nos. 7, 8 and 9 in Clear Creek district.

##### JUAB COUNTY.

D. Lombard, J. A. Pierce, A. Jensen, J. C. Jensen and G. Swanson have incorporated the Sweetwater Con. M. Co., capital \$3000, and office in Eureka. The property consists of claims near Eureka under development.

##### SUMMIT COUNTY.

At the California mine, at Park City, the capacity of the concentrator will be doubled by installing additional tables, jigs and rolls.

##### WASHINGTON COUNTY.

Control of the Surprise group of copper-bearing claims at St. George has been bought by Park City, Tintic and Salt Lake investors. The buyers are said to have paid \$31,375 for the control to G. Adams of Eureka.

The Paymaster group at St. George has been bought by J. J. Mullin and A. J. Malloy for a London company.

##### WASHINGTON.

##### JEFFERSON COUNTY.

It is reported that J. Singer, representing New York people, has bought several free-milling gold propositions in the Olympic mountains, near Port Townsend, for, it is said, \$10,000 from J. Rice, J. J. Brown, D. M. Cook and M. Moran of Everett.

##### PIERCE COUNTY.

The Southern Pacific Co. is building seventy-five coke ovens at Carbonado. For fifteen years past the entire product of the Carbon Hill coal mines has been shipped to Oakland and San Francisco for use on the ferry boats and locomotives. The indications were that their output would have to be restricted when the Southern Pacific substituted petroleum for fuel. Mr. Davies, Supt. of the mine, suggested the manufacture of coke. The first battery of seventy-five ovens is nearing completion. At Wilkeson fifty more coke ovens are being built and thirty-three additional at Fairfax. These increases make nearly 300 ovens in this county.

##### SPOKANE COUNTY.

The Montezuma M. Co. has been incorporated at Spokane, capital \$375,000, by C. Hough, T. Hooker, G. W. Roche, A. S. Dibble and J. T. Person.

#### FOREIGN.

##### BRITISH COLUMBIA.

The contract for the Lenora smelter, which is to be erected at Osborne bay, opposite Mount Sicker, has been awarded to F. Sherbourne, of Victoria. Work of con-

Moctezuma, Sonora, Oct. 26.

CHARLES D. WALCOTT, director of the United States Geological Survey, is in San Francisco. He is personally inspecting the work of the irrigation survey in his charge and states that in addition to this the department has during the past sum-

**CAN CLEANING MACHINE.**—No. 685,000. Oct. 22, 1901. Wm. Munn, San Francisco, Cal., assigned to Alaska Packers' Association, San Francisco. This apparatus is designed to clean cans after they have been filled. The outsides of the cans are sometimes rusted and are often covered with adherent material which prevents their being properly soldered. This apparatus is designed to clean the cans in readiness for soldering, and it consists of a revolving brush, intermittently mov-

## ASSESSMENT NOTICES.

**THE CALIFORNIA DREDGING COMPANY.**—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of October, 1901, an assessment (No. 3) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, 120 Sutter Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 23rd day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of December, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary.  
120 Sutter Street, San Francisco, California.

**AMERICAN OIL AND REFINERY COMPANY.**—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of October, 1901, an assessment of five (5) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No. 323 of the Parrott building, Nos. 825 to 855 Market Street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 30th day of November, 1901, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 23rd day of December, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors,

J. C. ANTHONY, Secretary.  
Office—Room 323, Parrott building, Nos. 825 to 855 Market Street, San Francisco, California.

**TANANA MINING COMPANY.**—LOCATION OF principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of September, 1901, an assessment (No. 4) of ten cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 2nd day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,

EDWARD H. STERNES, Secretary.  
Office—Room 801 Claus Spreckels Building, San Francisco, California.

**THE THORPE MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of October, 1901, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 632 Sacramento Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 16th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,

A. F. FREY, Secretary.

Office—632 Sacramento Street, San Francisco, California.

**YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of October, 1901, an assessment (No. 4) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,

EDWARD H. STERNES, Secretary.

Office—Room 801, Claus Spreckels Building, San Francisco, California.

## NOTICE.

NOTICE IS HEREBY GIVEN, that pursuant to written consent of the holders of more than two-thirds of the capital stock of THE JUMPER GOLD SYNDICATE OF CALIFORNIA, LIMITED, a corporation organized under the laws of the State of California, and also pursuant to a resolution of the Board of Directors of said corporation, the principal place of business of said corporation has been removed from the City and County of San Francisco, State of California, to the Jumper Mine, in the County of Tuolumne, in said State of California. (Signed) WILLIAM ADAM, Secretary of The Jumper Gold Syndicate of California, Limited.

Dated San Francisco, October 25th, 1901.

50 Horse Power

TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.
 Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING COMPANY,

THE RISDON Hammered Shoes and Dies.

Manufactured from the best quality of projectile steel—which is stronger and tougher than any heretofore used—the best shoe and die ever made. Will crush more ore per pound of steel than any other. Will not chip or cup and will outcrush any other made. Wear smooth and true with hardly any perceptible decrease in their size, and those who use them say, "We never had shoes and dies wear so long." Send for circulars and dimension blanks to

RISDON IRON WORKS,

SAN FRANCISCO, - CALIFORNIA.

The JOHNSTON CONCENTRATOR.

DURABILITY, CAPACITY AND SIMPLICITY
: : ARE ITS ESSENTIAL POINTS. : :

SAVES MORE VERY FINE SULPHURETS
THAN ANY OTHER CONCENTRATOR MADE.

The Johnston Concentrator is slung with arms from above on an angle, giving it the oscillating motion that makes it a perfect machine. This undulating motion immediately settles the sulphurets, retaining all amalgam, leaving sulphurets very clean, one 6-ft. Johnston doing the work of two 4-ft. belt machines.

Send for
Catalog No. 14.

Westinghouse Dust Proof Motors

Especially adapted to mill and mine where
the open type of motor is not applicable.

**Westinghouse Electric
& Manufacturing Co.**

All Principal Cities
in U. S. and Canada.

Pittsburg, Pa.

Westinghouse Dust Proof Motor Operating Coal Conveyor.

WOODBURY'S SIDE SHAKE CONCENTRATOR.

THIS Concentrator is superior to any other Belt Machine. It has an iron frame, steel shaking frame, and built in the most thorough manner. The patent distributing device distributes the pulp evenly over the whole working surface of the belt; thereby it enables the machine to perform perfect work, and giving more capacity to the Concentrator than any other Belt Machine. The variable eccentric crank gives the machine greater capability to work different classes of ore. I will warrant this machine as having more capacity than any other Concentrator.

Simple in Its Construction - Saves Fine Sulphurets -
Without Loss in Tailings
- Makes High Product - Capacity from 5 Stamps

RUSH YOUR ROOFING==

Don't put off putting on your roofing—put it on now while this good weather lasts, for the rains will soon be here and it is very inconvenient to put on P & B Ready Roofing in the rain.

P & B Ready Roofing is the only kind of roofing you ought to use, for it is the only kind that does not cause any regrets.

P & B Ready Roofing will stand any kind of climate and all kinds of weather—it never rots, runs, scales, cracks, expands or contracts—it won't warp and break, neither will it melt and fill the gutters and drain pipes. P & B Ready Roofing keeps buildings warmer in winter and cooler in summer. It is a remarkable roofing, and every builder who has ever used it continues to use it again and again.

Send for our booklet giving complete information. Address Dept. A.

SUCCESSOR TO

GATES IRON WORKS, Chicago
DICKSON MFG. CO., Scranton.

MANUFACTURER OF

Mining Machinery

There are
reasons
why

the adjustable and practically indestructible GATES ROCK AND ORE BREAKERS produce crushed material at a much lower cost per ton than other breakers. To more than 5,000 users located in all parts of the world, the cause is readily apparent. Gates Breakers not only have much greater capacity, require less power, run without vibration, stoppage or delay, with less wear on the crushing surfaces and permitting carloads of material to be dumped directly into the hopper of breaker, thus reducing the employment of handling devices and manual labor to the minimum, but other convincing reasons supported by indisputable evidence of the superiority of Gates Breakers are given in Gates Catalogue No. 1. Avoid a false start and possibility of failure. There is absolutely no breaker made that will compare with the "Gates."

We are prepared to build crushing plants complete, screens and perforated metal of all kinds, elevators, hoists, engines, and boilers. We also build cement machinery of the latest designs. ESTIMATES FURNISHED UPON APPLICATION.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeanesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeanesville Pumps.

We claim that in Jeanesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

WHY TO BE PREFERRED?

BECAUSE--

First: Inventors have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that all the inventor's ideas will be correctly conveyed, avoiding mistakes and vexatious delays.

Inventors living at a distance from San Francisco may, where they so desire, consult directly with our Washington office.

Second: Inventors receive the benefit of over thirty years' continuous, successful experience.

Third: A description of the patented invention will appear in the Mining and Scientific Press.

Fourth: We have a complete Patent Library, including official records since 1793 and full certified copies of all patents issued since 1872. These are for free examination by any one who desires.

We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches, and give opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete. Inventors' Guide sent free on application.

The Pelton - Doble Litigation.

Those who know "Doble Wheels" will not use "Peltons."
The Pelton Water Wheel Company has awakened to a realization of this fact. It has found its wheels widely replaced by "Dobles," and its prestige gone.
Has it tried to demonstrate that the public is mistaken—that the "Pelton" is a superior wheel?
No.
Why?
Because, when put beside a "Doble Wheel," the "Pelton" has always shown far less efficiency. The Pelton manufacturers want no more comparative tests.
What was there left to do?
Happy idea! Bring an infringement suit. That must last a long time, and in the meantime—so

our ex-competitors calculated—they might deter the public from buying "Doble Wheels" by threats of suits for damages.

So the Pelton Water Wheel Company filed a complaint against Abner Doble Company, based on information and belief, and not under oath, to enjoin the use of centrifugal discs, which prevent water from escaping from the housing along the shaft of the wheel.

We will not try our case here, but call attention, however, to the following facts:

- FIRST—The suit in no way affects the Doble bucket.
- SECOND—The device complained of is one first patented by William A. Doble, and not used by Abner Doble Company since before the Pelton Company secured its patent, because superseded by our present and much better contrivance.
- THIRD—Our present device is wholly dissimilar to that of the Pelton Company.

W. A. DOBLE
PATENT No. 619,148; DATED FEB. 7, 1899.
SERIAL No. 884,343; FILED DEC. 29, 1897.
LAST USED, JANUARY, 1899.

PELTON WATER WHEEL CO.
PATENT No. 833,962; DATED SEPT. 26, 1899.
SERIAL No. 892,733; FILED OCT. 5, 1898.

See the above cuts of the OLD Doble and Pelton patents, together with significant dates.
Will the public be bluffed in this way?
We will guarantee purchasers of "Doble Wheels" against infringement suits.

Operator taking courses or horizontal
angles with BRUNTON'S PAT. POCKET
MINE TRANSIT.
If you wished to find the angle be-
tween two points below the horizontal
with a sighting compass or an ordinary
transit, you would first have to set up
your tripod or staff and then level up
your instrument. All this takes time.
If you only wanted to get the angle
within a degree or so, you could take
a BRUNTON TRANSIT, and holding it
in the position shown, take your
readings in less time than you can
place any other instrument. Send for
descriptive catalogue B9 to

No. 44 BRUNTON BALANCE. Sensibility 1-100 milligrammes
If you are in the market for the very best balance obtainable at
a moderate price, write us for particulars about the No. 44. You
will be surprised to find how cheaply it can be purchased for
cash. While we cannot recommend this balance for fine gold
work, a great many assayers are using it for such successfully.
Send for illustrated catalogue A9, for complete description and
prices, to

Don't Take Chances

Anding out, after you have erected an expensive Mill, that the method designed won't treat your ore. THE TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a specialty of

CYANIDE WORK

claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; experts, however, are constantly devising improvements, the latest being a method of overcoming difficulties which have hitherto prevented the successful handling of ores containing copper and a method for the profitable handling of silver ores by cyanide.

SUITE 1402. NO. 128 BROADWAY. NEW YORK CITY.

W. & P. CYANIDE PAINT.

THE VERY HIGHEST GRADE OF PAINT OR COATING FOR
Cyanide and Chlorination Tanks and Vats,
FLOORS, SINKS AND TRAYS,

Or wherever acids, alkalis or water are used. Excellent also for REFRIGERATORS, being odorless when dry. It is a pure asphalt paint, and therefore unaffected by acids or alkalis. Dries very rapidly to an extent sufficient for handling or for application of second coat, but its full hardness is not attained for some hours, as drying is retarded by use of a heavy oil, and durability of coat is thus greatly increased. When dry is very tough and not brittle like most asphalt coatings. No carbon bisulphid, ether or other poisonous ingredients are used in its preparation, and as it gives out no noxious fumes or gases it can be used in perfect safety in confined places. For purposes given this paint is the equal of any other paint made, no matter if sold at double the price.

In Barrels, 60 Cents per Gallon;
In Cases, 65 Cents per Gallon.

Can be ordered through the trade. Insist on your dealer getting W. & P. CYANIDE PAINT for you or write us direct.

PACIFIC REFINING & ROOFING CO.,

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years. They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

IT IS TO GRIND

THE SMIDTH BALLMILL

AN EXPERT OPINION.

L. S. Russell of Lansing, Mich., of the Bureau of Labor and Industrial Statistics of Michigan, has recently completed a tour of investigation of the Portland cement industry of his State. He is particularly enthusiastic over the Omega Portland Cement Company's plant at Jonesville, Michigan, which he terms "the really model factory, where everything is run on a perfect system."

"Cement," Sept. 1901.

The entire output of the Omega plant is finished in SMIDTH BALLMILLS AND DAVIDSEN PATENT TUBEMILLS. Further comment is unnecessary.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accord-
ance with Law.

We print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act passed by the California Legislature. The law is entitled "An Act to Establish a Uniform System of Bell Signals to be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

The FRUE VANNER with Brownell "PATENT LIP" Flange Belt

stands for everything that is good, desirable and reliable in concentration. The FRUE VANNER is the STANDARD by which ALL OTHER concentrators are judged. If you buy some other concentrator you MAY get satisfactory results. If you buy a FRUE VANNER you are SURE to be satisfied. You get a durable machine of the highest capacity that gives a clean concentrate with the least possible loss in the tailings. The FRUE is furnished with the Brownell "PATENT LIP" FLANGE BELT. This is the best and highest priced

belt on the market. There are over 1700 them now in use, and we have plenty of testimonials to show that after seven years' constant wear they are still without a break the flange. All the largest Mining and Milling plants on the Pacific Coast, and in all parts of the world, have adopted them. Machines are made in four and six-foot widths, and furnished with either plain or corrugated belts. We supply either wood or iron carriage frame, as may be desired.

The pick and shovel have so long been considered the typical symbols of the miner's industry that the knowledge that their primacy is passing brings with it the shock of a questioning surprise. There has been no place with which they have been more associated in thought, and once in fact, than the black galleries of a coal pit. Yet the typical picture of a coal mining gallery to-day is a couple of men armed with monkey wrenches and larger tools that look like loggers' pikes, watching a low-lying, steel-chained thing of metal, that looks like a reaper cutting down coal like grain. Picks and shovels are hardly in sight and very little in use. The same elimination is going on in metal mines. The rock and ore are broken down by powder and then drawn up from the floor and loaded into the mine cars by scrapers. Cars, except platform cars, are self-discharging, and the platform cars are cleaned by a scraper hitched to a cable. Everywhere the pick and shovel are having their former exclusive use limited, till the end when they will have a place in the museum beside the stone hammers and flint knives, is within anticipation.

MANY Colorado and Utah mine owners are discounting the possible unfavorable effect on their business from dependence on the large smelting and milling combinations by making among themselves local combinations in the joint ownership of reduction plants. It is safe to say that such plants cost but little, if any, more to install, ready for operation, per ton of capacity, than the enormous centralized plants of the large combinations. The builders of machinery and reduction plants do not discriminate in prices against the buyers of small plants. The flat cost per ton of capacity for operation may be larger—but is not necessarily so—than the flat cost per ton of capacity for the operation of the custom plants. But mine owners when they pay for reduction of their ores at the large consolidated custom plants do not pay flat cost, but sums which are elastically defined as charges. The profit over flat costs and over current interest on money investment in the plant capacity, as a rule, exceeds the difference in flat costs against the small plants owned and operated by the mine owners. Such small mine owners' plants are at no commercial disadvantage when the combinations hold up prices, as they can sell as they produce in the open market. Being independent, they do not have to reduce production to maintain prices. Natural industrial laws, which would regulate production by suspending the most costly production, when prices go down under decreasing demand or too much production, act freely to restore normal trade condi-

tions. The increasing disposition of mine owners to own and operate their own reduction plants is to be commended. As this journal has frequently stated, custom reduction works and ore buying smelters may make a mine out of a prospect, but they do not necessarily make a mining business out of a mine.

The Lead Ore Market.

The sale price of lead in ores has been reduced by the American Smelting & Refining Co. from \$3.90 to \$3.40 per hundred pounds. This price as a settling basis applies to lead ores bought by the company from producers who do not have contracts with it. These latter will receive payment on the basis of \$3.90 till their contracts run out. The open price of lead to the consumers of the metal remains based on the buying price of \$3.90 per hundred pounds.

It would appear from the present price that lead production is (as this journal suggested some months since) rapidly coming to a point where it must be considered from a mining business standpoint as a by-product production. That is to say, the market price to consumers will be fixed by the production of lead from ores in which the principal values are (first) gold and (second) silver. While the silver production of such ores is much larger than the gold, silver has its own market price troubles. All of the lead produced will not come from these ores, but the largest quantity and cheapest lead will come from them, and the largest quantity and the cheapest cost of production will establish the market price of the entire production.

Combinations may put up the sale price of lead to a very profitable figure, but it is impossible for them to keep the sale price up permanently. There is an average of profit resulting from all metal mining business. If producers of one metal for a time receive much over this average, the effect is to stimulate production by increasing the number of producers. In the production of lead the market price has been high, and to high-grade ore mines has made a large margin of profit possible. Low-grade mines have been exploited under the stimulus of these profits, sharing in them by the production of large quantities of low-grade ore, instead of by lesser quantities of high-grade ore.

The increased production has been abnormal, as a result of the maintenance of the price of lead by a combination of selling interests when the market was not consuming the full production. Left to itself, the price would have receded and cut off surplus production several months since. Now that the inevitable has happened, and the price cannot be maintained any longer, efforts are being made to arbitrarily limit production. Producers who have no contracts are naturally the first to be affected. The price they are offered has been reduced. The producers who have contracts that fix the price are, on the other hand, paid a bonus not to produce. The high-grade ore mines that, under normal business conditions, would be supplying the market are being stood up and forced to pay part of the cost of keeping mines closed that, under the same normal business conditions, would be closed without any payment.

The condition quite fully developed now confirms the correctness of the conclusions this paper has heretofore expressed as to the effect of the smelting combination on the lead mining industry. The mining and reduction of lead in these modern days of close figuring in business can not be conducted successfully as independent business operations. Either the smelting combination must own the mines, as part of the smelting business, or the mines must own and operate reduction plants as part of the mining business. The latter is the commercially desirable condition.

THE idea of crushing with stamp batteries set tandem or in series, one set crushing through a coarse screen and the second crushing the oversize from the first that will not pass the final screen of the second series, is discussed by E. D. Chester in the Mining Journal of London. He states that experimental tests made of the method show an added duty to the stamp head of 35% and a saving of power to the amount of 6%. The test of commercial operation yet remains to be made before the highly satisfactory results obtained in the experimental tests can be used as the basis of the suggested change in

stamp mill practice. The margin for commercial profit is so large, however, that the method should by no means be neglected except as found a failure after most exhaustive trials. In a comparatively small way, but still on a commercial scale, a stamp battery and a Chilian mill have been used tandem in a California plant. The stamp battery crushed through a coarse screen and the pulp went unscreened direct to the Chilian mill, where it was reground. The output was increased something over what the two mills would have done independently, but no record was made of the quantities. It is easy to see that if the pulp from the stamp battery had been screened through the fine mesh screen used with the Chilian mill, and only the oversize run through the latter, there would have been a much larger gain in duty. This method of using a Chilian mill after stamps seems free from some practical difficulties that might be found in commercial practice through using stamp batteries tandem.

Tonopah Mines, Nevada.

Tonopah, Nev., mines are barely a year old, yet they have already made a record notable in a State where notable records for mining districts are almost as numerous as the districts. The complete illustrated descriptive article that appears in this number and the article published in the early-day period of its development six months ago tell the story of the starting of the latest favorite, claiming the attention of the public. Unlike most favorites which take much money from the outside to make them what they are, this favorite is paying its own way from the start. In Tonopah district the yielding of profit has followed so close on promise of it that even the near-by residents of Nevada State do not fully realize it.

Nevada is no longer tied to the fortunes of the Comstock at Virginia City and Gold Hill. As a commonwealth, it is not disappearing through the failure of its original great industry. With the temporary decadence of interest, due to the long-continued period of time since the discovery of a bonanza on the Comstock, the State was unjustly condemned as a field for mining industry. The later years, which to every other State and Territory of the West brought a resumption of mining industry, coincident with the spread of knowledge that mining was business and not gambling, have finally weakened the belief that Nevada mining was a failure and only gambling, and this last year has seen many of the old camps take on a well-deserved new life and has witnessed the discovery of several new ones, of which last so far Tonopah is easily the first.

Most of the older camps which are being reopened have had outside capital providing the means. The new discoveries are the old Nevada prospectors' own. Men who have had the persistence of faith and the coincidence of good luck, and who have remained with Nevada through the years of mining depression, have made the discoveries of Reno and Tonopah and have the rewards. It is pleasant to be able to add that they have shared their good fortune with others whose opportunities and successes had been less.

Tonopah seems to have stood the test of considerable commercial exploitation. The mines have paid their own way. The conditions developed by this considerable exploitation would seem to insure its successful continuance.

THERE is really no "rebellious" ore, in the sense that the early-day miners use the term. It has been the scapegoat for a multitude of mistakes in mines—and in miners. If the ore contained no metal values at all, if it contained silver or copper when, according to the promoters, it ought to have had gold, if the millmen stole it, if it would not amalgamate—it was all fully explained when it was said to be rebellious. The only variation was when it had lead instead of silver; then it was base. Rebellious or base, the art of metallurgy knows the term no longer, as applied to ores. Some have more value than others, some have to be treated by fire, others by water, and lately the wind has been harnessed to treat others. Some of them yield their metal values to the miner, others to the smelting trust; but some one gets the value in any event. Rebellious and base can no longer be used as scapegoats to explain that no one has got the values.

Concentrates.

THE thin coating of lime on the gauge glass can be removed by a little swabbing with strong vinegar.

VERY GOOD samples of bird's-eye porphyry can be obtained from a deposit in Placer county, Cal., near Clipper Gap.

MINE TIMBERS should be framed and secured firmly in place by wedges. Nails or spikes should not be used.

THE Ganz system of electrical railway equipment as applied in Italy is claimed to be at least 40% cheaper than the American systems.

IN an air compressor at 100 pounds gauge pressure 1 cubic foot corresponds to 7.82 cubic feet free air; at 80 pounds pressure, to 6.46 cubic feet; at 60 pounds, 5.10.

ALUMINUM SCRAP has a recognized commercial value, ranging in New York from 24 to 26 cents a pound. This price applies only to the pure aluminum, not to alloys.

A TANK to contain 30 cubic feet of space and 100 balls, each 6 inches in diameter, should contain 36.5 cubic feet. If 37½ inches in diameter it should be 4 feet 9 inches high inside.

THE seacoast lands of Alaska, on Behring sea, have no timber growth at all. The principal source of supply for this article is drift wood, which is piled up on the beaches in enormous quantities.

IF the wolframite carries 60% tungstic acid, and is favorably situated as to mining and freight conditions, it might be commercially profitable. There is a limited demand, chiefly from Eastern steel makers.

THERE are said to be sixty-nine petroleum gushers in eighty acres of land on Spindletop hill, at Beaumont, Texas. It is reported that the pressure is diminishing and that the installation of pumping plants is anticipated.

OUTSIDE of California, the only producing quicksilver properties north of Mexico known to "Concentrators" are at Woodstock and near Jacksonville, in Oregon; Savonas, British Columbia, and Terlingua, Texas. Each of these has been illustrated and described herein.

FOR tunnel and drift timbering, round or split timbers will generally be found most economical. In shaft work, sawn timber will generally be found to cost less than round timbers. The latter require much more work to frame and are not so adaptable to machinery installation.

THE best up-to-date information on ore concentration can be had in this paper or from the latest catalogues of manufacturers of concentrating machinery. There is not any "new book" on that subject, as manufacturers and metallurgists are in this case in advance of the book-makers.

THERE is no platinum ore "in place" in California or on the Pacific coast, so far as known, the metal on this part of the continent being found usually in grains or pure metal, or as grains of a metallic alloy containing platinum. It is rarely found other than where placer gold is found.

COPPER WIRE for the feeder wires of electric railway lines is being more and more replaced by aluminum wire. It is claimed that, at the present price of copper, aluminum is 20% to 25% the cheaper. It is estimated that over 600 tons of aluminum were used for electric feed wires in 1900.

THE excellent quality of Norway iron was due to the smelting of the ore with charcoal at a low temperature, which did not reduce the silicon and phosphorus in the ore. The latter impurity is present in less quantity in Norway iron ores than in the iron ores of other iron manufacturing countries.

THE International Mining Congress may not be held in Butte, Mont., in 1902. It is required that Butte raise about \$10,000 to entertain the delegates, and failure to do this would be the reason for sending it to Los Angeles, Cal., which was the second choice of the late meeting of the Congress at Boise, Idaho.

THE U. S. District Court of Alaska, in the case of Price vs. Broakway, a suit of ejectment over the possession of a town lot of Skaguay, has decided that a suit of ejectment can be maintained for the possession of improvements on Government land in Alaska. The lot in dispute was not fenced or otherwise enclosed, but had a cabin on it.

THE Supreme Court of Montana, in the case of Parrott Silver & Copper Co. vs. Heinze, decided that, where the apex of a vein passed through a side line and through an end line of the claim, the extralateral rights were bounded by the plane of the end line and by a parallel plane extending downward through the point where the side line was crossed.

THE fractions or fractional claims described in accounts of Alaska mines consist of the small pieces of ground that are left over when claims are measured out closely. The custom of the miners in locating is to include too much ground rather than too little. When restricted to legal limits, the excess becomes a fraction or fractional claim. They are closely looked after in rich ground.

THE machine weighing less than two pounds, to drive shingle nails, does not require technical skill to operate; a workman with less labor and no physical discomfort

is enabled to do shingling at a doubled speed as compared with the hand method. The machine is fed several handfuls of nails of the size for which it is made, and it then sets them up and drives them one at a time—two blows of the plunger hammer for each nail.

ORDINARY CONCRETE, even in masses of great thickness and when made with mortar rich in cement, is always permeable to water. Only a tight, smooth and continuous lining is able to protect it. This can be made of tarred felt in two or preferably three layers. It is built into the breast of the concrete mass so that it forms a sort of partition in it. Water which may reach it through cracks in the cement cannot pass through it.

THE preferable type of ladder construction in a vertical shaft is broken into short stages by platforms in the ladder compartment. The ladder line is thus made up of a number of short ladders set inclined from platform to platform. The length of each ladder is from 16 to 21 feet, advantage being taken of 5-foot apart timber sets for the platforms. The breaking of the ladders into sections is an advantage in sinking a shaft and is safer for men who use it at any time.

THERE is no limitation by law of the number of claims, either lode or placer, which one person, properly qualified according to law, can locate on one placer deposit or on one ledge. A discovery location on a ledge can be made and then extensions can be located. It is essential, however, to make the location of the latter valid, that there shall be discoveries on them—that is to say, they cannot be located on faith alone as extensions, but must have on them valuable mineral which is discovered by the locator.

THE Tipton district mines, England, made an output of mineral during the year 1900 of 707,602 tons. The total quantity of water raised was 18,385,780 tons, or twenty-six tons of water to every ton of mineral. The cost of the pumping per ton of water was about a farthing (half a cent). The pumping plants are regarded as obsolete and expensive and changes are projected looking to the installation of electrically operated pumps, with power obtained from gas made by the Mond method for the prime mover.

THE Supreme Court of California, in the case of Cave vs. Tyler et al., on appeal from a San Bernardino county trial court, has decided that an appropriation of water from a stream, diverting the entire flow, does not ripen by prescription into a vested title as against a subsequent diversion by a riparian or other claimant up stream; that there is, by virtue of the lower and senior appropriation taking all the water of the stream, no vested or accrued right to all the water of the stream up through the public land to its source.

THERE is no good business reason for the practice of allowing very large margins of power in providing for the machinery of a mining plant. Extra weight and cost of the excess of metal, and extra operative cost to move the excess, make a continual unnecessary burden of cost against the business. Machinery should be given enough power to do the work for which it is designed, but it should be kept in such a condition of efficiency that there should be no necessity of having an excess of power for contingencies. There should be no contingencies.

THE Commissioner of the General Land Office at Washington has adopted a new schedule of deposits for official surveys of mining claims in the office of the U. S. Surveyor-General for Utah. The deposits will be: For lode claim, \$30; for placer claim, \$30; for mill site (separate), \$25; for mill site and lode claim embraced in one survey, \$45; for upward of three locations embraced in one survey, for the first location, \$30; for each subsequent location, \$20; for each lode claim within and included in the survey of a placer claim, \$15; for certificate of \$500 expenditure of improvements after approval of survey, \$5.

A NARROW vein of high-grade ore is ordinarily most economically and satisfactorily worked by stripping the vein on the hanging wall side before breaking it down. The object of this is to enable a more thorough separation of waste rock and ore to be made. With the hanging wall rock broken out and disposed of as filling in the stope underfoot, a canvas or board floor can be laid on it, onto which the ore falls when broken out. From this it can be sacked directly or shoveled into chutes without the loss of the finer broken ore, which is as a rule the richest. Any waste broken out from the foot wall with the ore is readily sorted out and thrown aside.

LOCATIONS of mining claims within patented town sites have been declared void by the California State courts. The case on which the decision was made originated in an attempt to locate placer ground in the town site patent of the city of Oroville in Butte county. The status of lands outside the survey meander lines of Feather river at Oroville and in the bed of Feather river are now being litigated by mineral claimants. In a case before the Interior Department at Washington, where the same question was at issue with Rogue river, Oregon, placer claims, the Department ruled that it did not have jurisdiction, and that locators on such lands would have to get title and the right of location under State laws.

THE gold in sea water does not precipitate from its solution in sea water during the Arctic winter, when the water under the ice is quiet. The gold-bearing beaches at Nome, Alaska, are not enriched by gold from that source. The proponent of the theory must have confused solution with suspension. Fine particles of gold

mechanically suspended in sea water or any other kind of water will settle out of it by gravity. But the gold in sea water is not suspended as such, but is in solution, probably as the chloride and bromide of gold. These salts have to be chemically broken up to precipitate the gold. There is no evidence that these salts which are in exceedingly minute quantities in sea water are broken up and deposited while part of the sea water. This paper has several times heretofore, in answer to inquiries, explained in detail the simple, natural action by which the land-formed placer deposits became the bed of the sea and the marginal beaches to it.

GOOD ROADS, or their temporary substitute—good trails—cannot fail to prove an economy in the opening or prospecting of a mine. The custom of using the barest excuse for either for months, or it may be years, until the prospect develops into a mine results in an entirely unnecessary loss of time and labor used in travel over them. This loss is really a loss of money, because time and labor necessary or unnecessary have their money equivalents. It is cheaper, too, to make the good road or the good trail in the beginning, once for all, and not make a series of successively closer approximations to what is desirable, each in turn to be abandoned for the succeeding better one. Several poor substitutes for roads or trails will invariably in the end be found to have cost more than the one good one made in the beginning. The excuse that the prospect may not make a mine, and roads or trails will then become a dead loss, is not a sufficient one, though true. The development of the prospect is begun on just exactly as if it was the beginning of the making of a mine. Every economy that would prove such in the long run of mine operation is economically justifiable from the beginning. Besides, it may be added that, suppose along with the other money, time and labor put in the ground, the money, time and labor put in the road or trail is lost, there would on close accounting be found, as a rule, less money, time and labor loss in the good road or trail construction than in the poor substitute.

THE custom in Russian and Siberian mines is for the miner to make on the employer's time the handles to the picks and shovels. The pick commonly used is made of iron, steel pointed, weighs about six pounds and consists of a handle socket and only one point. The handle which the miner prepares is the limb of a small tree trimmed down with the ax. It is only about 24 inches long, and is thus shorter than the handle of the American pick. The shovel is about the size and weight of an American coal handler's shovel. In shape it is more dish like, more pointed and longer in proportion to width than the long-handled mining shovel of the West. The handle, like that for the pick, is made by the miner from the limb of a tree which has been worked down into shape with an ax. The handle is short and is fitted into a metal socket and held by a pin. The miner cannot lift earth and rock with it over breast high, and that with very considerable effort, as compared with a throw of 8 to 9 feet made by the American miner's shovel. The Russian operators, however, very generally will be found to prefer their own home-made tools, claiming them to be the cheaper for them, particularly because the native tree-limb handles are so cheap and can so easily be replaced when broken. It is largely through such ideas of cheapness and the use of such inferior tools that the Russian mining is costly, though Russian miners' day wages are very low. It is a condition that has not always been given the determining weight in considering the mining investment of foreign capital in Siberian mines that it should have. When the better tools are substituted and the workmen made skilled in their use, the latter invariably have to be paid higher wages, so that in the end it is found that the cost of the work to the mine operator is not diminished a great deal.

THE longest mining tunnels projected and in course of actual construction are very largely in Colorado. These they are being run to crosscut single mountains and ranges containing a large number of ore-bearing ledges. These ledges are being intersected at depths far below what would be economically profitable by shaft mining. In addition to the great depth of backs over the floor level that these tunnels open, they can, when these upper ore bodies are more or less worked out, be utilized as a surface from which to sink to depths beneath. The tunnels and the open workings above offer exceptional advantages for this sort of deep mining. By provision therefor, the water that flows into the overhead workings can be collected there and conducted down to the tunnel level in pipes under pressure, which can there be utilized for power development. Practically, this costs the minimum in the way of investment, and, being possible of use direct, can provide the maximum of effective work from the theoretical efficiency. It is safe to say that 70% of the theoretical water power can be had in work. Under average conditions, more water will enter each 100-foot depth of workings above the tunnel levels than below. The power, then, that can be developed from the inflowing water above will perform the service of lifting of the lesser quantity of water coming in workings below to a depth very nearly, if not entirely, equal to the feet of head of the power water. With these practical working conditions, the tunnel exploitation of lode deposits in Colorado means cheap deep mining to depths that are unthinkable with dependence solely on shafts from the surface. The deep mining so effected may not be as spectacular as the deep shaft mining projected in the Transvaal, but it has the more satisfying quality of a safer and larger profit margin.

Tonopah.*

[STAFF CORRESPONDENCE.]

Once in a while the rapid wealth producing power of a new mining discovery gives to its place a name that remains fixed and inseparably associated with it, despite the far-reaching influence and efforts of the United States Postoffice Department to name it something else. The Comstock is such a discovery and such a name. Officially, to the Postoffice Department it is Virginia City and Gold Hill, but these might pass and yet "The Comstock" remain an undying memory of fortune from mines. Tonopah, like the Comstock, also in Nevada State, shows indications of becoming possessed, like it, of a name of destiny. Called Tonopah first by the discoverer of the mines, the Postoffice Department named it by request Butler to commemorate the name of the discoverer. But Tonopah it remains in speech and writing, and seems likely to remain.

Tonopah is that dream of the prospector—a grass-root mine. At least, it would be a grass-root mine but for the complete absence of the grass. It is well in toward the heart of Nevada, and well towards its top, being 6300 feet in elevation. This journal in its issue of May 18 gave an account of the discovery of the mines and their development at that time. Referring to it, the first settlement and work started just a year ago. By January 1 of this year the population was 80; by May 1, 225. Now it is easily 1000, and easily the leading mining town of Nevada in output of gold and silver and in mining activity. In a short year a community has grown up in the heart of a Nevada desert from just nothing at all to become a young city, building and supporting itself, not out of the surplus wealth of older communities, but by itself, by its own labor and the output of its mines.

This last is the striking feature of its growth and the all but indisputable guarantee that the district, as a center of population and profitable, self-supporting mining industry, is an enduring fact and not a Nevada desert mirage.

James L. Butler, the discoverer, brought no money into the desert to make a mine. He paid for his first assays by a deed to a twelfth interest in what he had

the royalty from the leases is repaying it faster than it was paid out.

As Tonopah is at the present time, it is an important place, 60 miles from and southeast of Sodaville, a station on the Carson & Colorado Railroad.

This station is the railroad base for supplies and also the shipping point for the ores which have been

at which point passengers are compelled to remain over night, the service from that point southward being tri-weekly, leaving Monday, Wednesday and Friday, passengers lying over night at Hawthorne and connecting with stages at Sodaville the following morning for Tonopah.

There are ten restaurants in Tonopah, and several

Brower Bros., Golden & Sinclair Lease, Tonopah, Nevada.

sent for treatment to the Selby Lead & Refining Co. at San Francisco.

The road between Tonopah and Sodaville is a natural, unimproved highway of very easy grade, following the depressions between the hills and crossing the sagebrush plains which make the characteristic topography of the State.

A tri-weekly stage runs between Sodaville and

lodging houses, and two hotels are now being erected. Board is \$8 a week or 50 cents a single meal. Wood is \$15 a cord and hauled 15 miles. Water will soon be piped to town; it is now hauled in barrels and sells at \$1.50 a barrel. Lumber sells at \$55 to \$65 a thousand, being hauled 60 miles from Sodaville. Hay in small lots brings \$2.50 per hundred and \$35 per ton. A large amount of produce comes here from

Oddie, Pheby Bros. and Peters Lease; Golden, Beauchamp, Tamblin & Sunderland Shafts in Background, Tonopah, Nevada.

found. The men who took first leases from him brought no money with them to pay for the mining. They were working miners, with no capital but the miner's knowledge of what was a good mine and the miner's strength and skill of arm to convert it into money. The men who did bring money to buy the mines have merely had to lend it—not spend it—for

*See illustrations on front page.

Tonopah, the journey requiring a day and a half, stopping over night at Crow Springs, a stage station, affording good accommodations. Railroad fare from Reno, on the overland railroad, to Sodaville is \$11, and from there by stage the round trip is \$12, or \$7 one way. The freight rate from Sodaville to Tonopah is \$20 per ton. Trains leaving Reno in the morning connect with the Carson & Colorado Railroad at Mound House daily for Hawthorne,

Bishops, Inyo county, Cal., by wagon transportation. Miners' wages are \$4 per day, carpenters' \$4 to \$6. At present the camp is supplied with miners, and the market for other labor is pretty well supplied.

There are three groups of mines in this camp, owned by three independent companies. The Butler group, comprising the original discovery locations, is owned by the Tonopah Mining Co. of Nevada, with J. H. Jenkins as general manager. The

Gold Hill group is owned by T. L. Oddie, Brougner Bros., A. L. Hudgens, R. Gordon and P. Manning, all residents of Tonopah. The Clifford group is owned by W. H. Dickson, A. C. Ellis Jr., O'Meara Bros., J. B. Thompson, J. E. Bamberger, W. A. Wilson, T. J. Lynch and others of Salt Lake City, Utah.

The Butler group embraces eight locations, the ledges all running nearly parallel, the Mizpah being at the northern and the Valley View at the southern boundary of the combination. The distance between these two is about 1500 feet. The topography and the situation of the several ledges are such that shaft

avoided breaking down second class ore or waste rock with it, and have made no special effort to produce quantity, but directed all energy toward getting selected, high-grade ore, which has also tended to limit the output.

The Mizpah ledge, at first neglected, is now producing much more ore than the aggregate of all the other ledges of the camp, and at present is being developed on a more extended scale. The developments on this ledge prove it to be a continuous ore shoot of 1300 feet, averaging about 4 feet in width. At no point along this ledge does it produce other than high-grade milling ore. Nearly 50% of the ledge, so far as exposed, is composed of ore containing values in gold and silver of \$100 to \$300 per ton.

Along the course of this ledge, and within the 1300 feet above named, ten shafts have been sunk, averaging between 100 to 175 feet in depth, from which drifts have been run for considerable distances. To a depth of 150 feet this ledge has been pretty well blocked out and its value is closely estimatable.

Beginning at the west end of the Mizpah ledge is lease No. 44 of Lynch, O'Meara & Sullivan, one of the greatest producers of the camp. The owners have lately installed a gasoline engine and hoist and a rock breaker, and will soon have in operation air compressor drills.

The next lease is No. 30 of Wilkinson, Coslett, Robinson & Stott, which also is yielding heavily in both high-grade and milling ore.

Cutting & Brown own the next lease, No. 19, which to-day, at a depth of 165 feet, has a 7-foot ledge of ore that will average \$150 per ton. This lease is also one of the largest producers in the camp of shipping ore.

The Clark or Company shaft, which joins lease No. 19 on the east, is down 155 feet, with a 4-foot ledge in the bottom. While sinking the last 75 feet, this shaft has in places produced over \$500 a foot.

Brougner Bros., owners of lease No. 36, also one of the very best producers of high-grade ore, are unable to sack it as fast as taken out. There are now 2000 sacks of shipping ore awaiting wagons to haul it to the railroad.

The next lease, No. 50, is that of Sinclair & Golden, who, after going through 100 feet of capping, struck a shoot 35 feet long of ore that assays \$200 to \$300. They now, at 160 feet, have a 4-foot ledge of high-grade shipping ore.

Lease No. 34 is owned by Oddie, Pheby & Peters, who have a shaft down 130 feet. They have had considerable shipping ore and a large quantity of milling ore at 115 feet down. Drifts 40 and 80 feet show 5 to 7 feet of milling ore.

Lease No. 80 is owned by Frank Golden, who, after going through ore of little value for 120 feet, struck good ore that has increased in value, and at present has a 4-foot ledge at 155 feet depth that carries values of \$200 to \$600 per ton. The recent exposure of this body of ore which is 250 feet farther east from others of high grade proves more fully the extension of the ore shoot.

Still farther east, and higher up the mountain, is lease No. 52, of Golden, Beauchamp, Tamblin & Co., who are taking out a large amount of good ore after sinking through heavy capping.

The next higher lease is that of Spenker & Co., whose claim has already produced some good ore. They are sinking and expect to strike the rich ore shoot.

Every one of the above leasers has been taking out ore at a profit and the total product will average over \$5000 per day. Cutting & Brown of lease No. 19 within a few days took out eight tons of ore that averaged \$500 per ton.

The Gold Hill group adjoins the Butler group on the south and consists of three claims—the McCulloch, Good Enough and Butler. While the general characteristics are similar to the Butler group, the overlying formation is hard; but, as depth is attained, the formation becomes softer, the ledges larger and better.

The ledges show excellent walls, with talc gouge, and are nearly perpendicular, inclining a little to the north, and about parallel to the Valley View ledge. While there are plainly a number of ledges in these claims cropping out on the surface, others are determined only by sinking.

There are a dozen prospect shafts, most of them being sunk by lessees, the deepest being 80 feet. The owners are about to put up a whim and sink a shaft to considerable depth. This group has been producing small quantities of high-grade ore for several months, and, as depth is attained, the indications are good that their values will prove as good as the Butler group.

In connection with the Tonopah properties, an enterprise known as the G. & H. tunnel site has been started. This tunnel crosses into the mineral zone and is headed towards the Butler group. It has now

Cutting & Brown Lease, Tonopah, Nev.

work is the only means of operating them to any depth, or, in fact, of performing any development work of consequence. All of the ledges are being operated by leases under a royalty of 25%, and upon allotment of territory 100 feet in length by 50 feet in width along the veins.

Operations are by no means strictly confined to the major lodes, for intervening—and, in fact, running almost parallel—between the stronger ledges are auxiliary ledges, all ore-bearing, that are also being prospected and developed.

In this area of about 1500 feet square shafts and cuts are in operation everywhere. Sacks of high-grade ore are piled up on the various dumps like

East End Valley View Ledge, Open Cut, Tonopah, Nev.

grain or cordwood. Over 10,000 sacks of ore, averaging over \$10 per sack, are on the Mizpah ledge alone, awaiting transportation. Windlasses, whips and whips meet the eye in every direction. Nearly all of the ore taken from the properties has been the result of development openings in sinking the shafts and by underhand stoping. Had the ground been opened and overhand stoping been systematically done, the product would have been much greater up to the present time. The leasers, aiming to extract the richer ores, have as far as possible

Cutting & Brown Lease, 50-Foot Level, Tonopah, Nev.

entered Oddie mountain, a distance of nearly 300 feet, and a connection has been made with the surface for air.

The face is now in a highly mineralized formation, and it is expected by the owners that any blast may break into ore. The owners of this property are T. L. Oddie, Brougner Bros., A. L. Hudgens, Robert Gordon and P. Manning—residents of Tonopah.

The Clifford group consists of the Wandering Boy and Stone Cabin claims; the former lies at the west end and the latter at the east end of the Valley View lode.

These, together with the Lucky Jim, were purchased by Dickson & Ellis of Salt Lake City last August. Up to the present time these claims have been exploited with a large force of men. The ores are very similar to the ores found on the Butler group; the ledges are strong and well defined. The company will soon equip the property with hoisting machinery.

Edwards, Cutting & Co. Lease, Tonopah, Nev.

The future of the Tonopah is not solely dependent upon the very rich rock that is being extracted, but, if anything, more upon the great mass of ore that will not pay the present heavy expense of transportation and reduction. Under existing circumstances it would be a difficult matter to form any satisfactory estimate of the amount of such ore in sight, inasmuch as a large percentage of values already mined is the result of shaft work, unconnected openings and drifting, carried on only to a very limited extent.

In this district a black silver sulphuret is the pre-

dominating mineral; gold here follows the silver in the ratio of \$25 of the former to 600 ounces of the latter, and, while treatment by free-milling process would save most of the metal, the owners' opinions differ regarding the advisability of undertaking to extract all of the values in the Tonopah ores by this process. Thus far, if there is any perceptible change, it is that values are increasing, rather than diminishing, as work progresses, and in some of the exposures the ratio between gold and silver is in favor of the gold in opposition with the general relative output of the two metals.

The idea formerly obtained here that the high-grade ores occurred in "pockets," but it is generally conceded now that the rich ores occur in shoots in the ledges of milling-grade ore. This has been proven particularly in the Mizpah ledge. Leases that had no shipping ore on the surface have been able to cut the high-grade shoots of their neighbors by studying the trend and sinking to proper depth.

A very interesting feature of all the ledges of the group, and particularly of the Mizpah, is the numerous lateral faults that occur at frequent intervals. While these have in some places thrown the ledge as much as 10 feet, they have not to any extent inconvenienced mining. In the opinion of some, these faults are to a considerable extent responsible for the extreme richness of the so-called shoots. It is suggested that the ledges were first formed of a milling grade of ore, and, by the subsequent faulting, the solutions that originally deposited values had a second opportunity to enrich the ledges at the points of fracture, and thus there seems to be an established system of shoots following along these lines of faulting.

The Tonopah or Butler group of mines up to the present time has produced over \$400,000. Besides this amount, 500 tons of ore are now en route to the smelter for reduction, and this ore is as good as that which has already been treated. Also, there are 15,000 sacks of same grade shipping ore now on the claims awaiting transportation to the railroad. Finally, there are 10,000 tons of second class ore now on the dumps waiting the determination of the company as to the most efficient and profitable process of reduction to be installed.

Nine-tenths of this ore has been taken from the Mizpah lode, as the largest development has been done on this lode. The Valley View lode, 1500 feet east, and several other lodes lying between it and the Mizpah, have produced proportionately well for the amount of development work done on them.

The Tonopah Company has already begun work with a view of getting a good supply of water into the camp from two different sources, and probably within sixty days the system will be ready for operation. There are over 400 animals engaged in hauling ore from this camp to the railroad, and as many more could be profitably employed.

There are 125 wooden buildings and 200 board and canvas buildings here, and more going up daily. There are fully 1000 residents here to-day. The community is one of the most orderly on the coast; nearly every branch of business is represented, including a branch of the Bullion Exchange, Bank of Carson City and a free library. Funds have been raised for a school building and steps taken to erect Presbyterian and Catholic church buildings. There is a good weekly newspaper, the Tonopah Bonanza, published here.

For the photographs from which the half-tones illustrating this description were made this journal is indebted to the courtesy of Al Smith, photographer at Tonopah.

Tonopah, Nevada, Nov. 1.

NOTHING better illustrates the dependence of one branch of science upon another than the history of the U. S. Weather Bureau. Meteorology as a science is almost absolutely dependent upon the electric telegraph; indeed, it is as it stands to-day directly a product of the extension of telegraph lines over wide areas. When the telegraph was invented and first put to work, no one foresaw that one of the results which would follow this extension would be the ability to plot instantaneous charts showing weather conditions over such a wide area as that of the United States, for example. As soon as it was possible to do this, it became easy to study the motions of storm centers and weather areas, and from them the science of meteorology, especially of weather forecasting, has arisen. While some of us may feel occasionally that this is not an exact science, yet statistics show that it is far more exact than is commonly believed, and that the percentage of verified weather predictions is astonishingly large. Both the weather service and the time service of this country are entirely dependent upon the telegraph.—Electrical Review.

THE following are the figures for the output of platinum from the Urals, Russia, for the last ten years: Ounces troy—1891, 135,874; 1892, 146,394; 1893, 165,787; 1894, 167,743; 1895, 141,668; 1896, 158,520; 1897, 181,693; 1898, 192,225; 1899, 191,172; 1900, 174,846. At present the Urals yield 96% of the world's platinum supply. The Platinum Industrial Co., which bought up a group of the most productive platinum mines, counting on an annual yield of 67,000 ounces, only produced 26,000 ounces.

Late Gold Dredging Practice.*

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS
by RALPH L. MONTAGU.

VARIOUS TYPES OF DREDGERS.—The following description applies to the type of dredger developed at Bannack, Mont.:

Fig. 1 illustrates the principle on which the dredger works. The gravel is excavated by an endless chain of alternate buckets and links and

the grizzly extends aft and is carried on and supported by an auxiliary flat boat. The flexible connection in this case is arranged by having the lower end of the sluice box on the dredger overlap the upper end of the sluice on the auxiliary flat boat. An opening is made in the bottom of the upper box, where it overlaps the lower box, which allows the material to pass through, and a turntable supporting the lower box at this point produces a flexible connection. The pump lifts water only, and consequently does not wear out as soon as the pump in the first mentioned dredger, which lifts water and gravel.

Fig. 1.—Principle Upon Which Dredger Works.

dumped into a rotating grizzly. A perforated pipe carrying water extends through the grizzly and by this means a number of jets of water impinge on the gravel and thoroughly wash the smaller particles free from the larger. The large stones fall overboard, the finer material carrying the gold falling into a sump, whence the gravel and water are lifted by a centrifugal pump into the sluice box. The fine tailings are deposited in the cut made by the dredger.

The upper end of the sluice box rests on a turntable, the base of which sets on the dredger, and a short length of special hose is the means of connecting the discharge pipe from the pump to the upper end of the sluice box. This arrangement forms a flexible connection between the dredger and the sluice box boat, and by means of cables anchored on shore and passing through pulleys on the sluice box to a hand winch on board the dredger the end of the sluice box can be swung from side to side of the cut and the tailings can be evenly distributed.

The dredger being held in position by a spud at the stern, the digging is done by commencing at one side of the cut and swinging slowly across to the other side by pulling in on one side line and at the same time releasing the other. The ladder is then lowered and the dredger is swung slowly back. This is continued until bedrock is reached. The ladder is then hoisted and the dredger moved ahead by swinging the boat and using the other spud to step up with in the following manner: We will presume the right hand spud is down. The dredger is swung to the right hand side of the cut; the left hand spud is dropped; the right hand spud is hoisted; the dredger is then swung to the left hand side of the cut and the right hand spud is dropped; the left hand spud is hoisted and kept up until another move ahead is necessary.

The distance moved ahead is regulated by the length of the arc through which the dredger is swung. While the dredger is moving ahead it is not digging. The operator stands in a pilot house, from which he has a full view of the work. By a system of levers he controls the bucket chain and the winch that hoists the ladder and swings the boat, and in some cases the same winch hoists the spuds.

This type of dredger makes a very clean cut—i. e., does not leave any gravel behind it. It can successfully handle very coarse gravel and large boulders. The spud holds it steady and there is not so much surging backward and forward of the dredger as there is on dredgers that do not use spuds. A dredger of this type with 5 cubic foot buckets will average about 2300 cubic yards per day from the beginning to the end of the season.

Another modification of the same model is the "single lift" type. In this style dredger the upper end of the ladder is considerably higher than in the preceding type. The grizzly is placed fore and aft and the sluice box beginning directly under

A stone chute carries the large stones overboard; the other points are similar on both dredgers.

(TO BE CONTINUED.)

Cyanide Treatment of Coarse-Crushed Gold Ore.

TO THE EDITOR:—A number of articles have been published lately in various mining papers regarding a so-called new discovery in the application of the cyanide process to gold-bearing ores, and as the case has never been quite correctly stated I thought it might be of interest to your readers to know the facts in the case, as there are probably numerous cases where the same system can be employed to a great advantage.

The mine where this work has been done was formerly known as the Cummings mine, near Callahans, in Siskiyou county. It has been opened and operated for a great many years, but owing to the extremely fine character of the gold the values in the ore could not be recovered by milling and amalgamation. Numerous assays of the ore showed an average value of from \$6 to \$9, and mill tests on the same samples showed that but from 13% to 17% of the assay value could be saved by amalgamation. Numerous tests were made with cyanide solution, and it was found that by passing the ore through a 40-mesh screen and treating with a weak solution of cyanide for fifty-six hours 96% of the assay value of the ore was recovered without the use of lime.

As the ore body showed every evidence of permanency, a dry-crushing cyanide plant was recommended and installed by the Helena Gold Mining Co., the present owners of the property. A new mill was put in to do the crushing, and after several months of trial it was discarded, as it was impossible to prevent the mill from grinding the ore to an absolute powder and making so many slimes that leaching was impossible.

Further experiments with the ore showed that the values were contained in an oxidized iron pyrite, and that the ore in breaking in the mine, as well as in the breaker, always broke where the structure of the ore had been weakened by the intrusion of a pyrite. It was then decided to experiment with coarse material, and these experiments were made under the direction of Frederick Lundstrom, who was in charge of the cyanide plant, and James McKeen, the superintendent of the mine. The results of the first tests showed that 80% of the value of the ore could be extracted from the material directly from the rock breaker—or, in other words, all material that passed through a grizzly with bars set 1 inch apart on an incline of 45°. This material was in no case larger than 1-inch pieces. The greater part of the material, however, was broken to about ½ inch or finer, and the consumption of cyanide in the treatment was one-half pound per ton of ore, the time of treatment being from seventy-two to ninety hours.

There is nothing in particular to wonder at in this

method of treatment, and its success lies in the fact that the values were contained in the oxidized iron pyrite, which was invariably exposed to the surface by the natural breaking of the ore. It is probable that the ore will change in depth to a sulphide, and in that event, of course, finer crushing will be necessary, but I am of the opinion that in all cases where it is found that the values are contained in oxidized pyrite this coarse crushing and cyanide treatment will be applicable.

EDWARD H. BENJAMIN.
San Francisco, Cal., Oct. 29.

Mining and Metallurgical Patents.

Patents Issued October 29, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

ROASTING FURNACE.—No. 685,344; E. B. Parnell, Carshalton, England.

A longitudinal housing A, of triangular transverse section rounded at top or apex, a hearth B dividing the housing throughout its length into upper and lower chambers A₂ A' respectively, means of communication between one end of each flue and a common source of heat and a chain conveyor arranged along length of hearth.

METHOD OF SEPARATING VALUABLE METALS FROM METAL-BEARING MATERIAL.—No. 685,508; C. E. Dolbear, Hyde Park, Mass.

Separating gold or other metal particles from the siliceous or similar particles in mill pulp, or other metalliferous material, consisting in passing the metalliferous material between and within the influence of opposing electrodes, charged with electricity of opposite kinds, whereby all particles of metalliferous material are attracted toward electrodes, and after contact therewith metal particles are repelled from electrode with which they have made contact, and attracted toward opposite electrode, while siliceous or similar material remains under attracting influence of electrode, and stopping passage of repelled particles during their passage from repellent electrode to attracting electrode.

GUIDE FOR STAMP MILLS.—No. 685,622; E. Major, Denver, Colo.

The girth beam, a back clamping plate dished rearwardly and having rearwardly projecting bosses, the girth beam being constructed to correspond with the face of plate, back clamping plate being provided with two forwardly extending flanges connected by a web at front edges, a front clamping plate dished forwardly and provided near top and bottom with rearwardly extending lugs adapted to

enter space between flanges of back plate, guide blocks held between clamping plates and engaging flanges, and bolts extending through clamping plates and girth beam, bolts passing between flanges of rear plate and having tapering enlargements intermediate of ends adapted to engage tapered openings extending through bosses of back plate, ends of bolts being secured to girth beam and front clamping plate.

PACKING FOR DRIFT, GALLERY OR OTHER OPENINGS IN MINES.—No. 685,522; J. Muirhead, Pittston, Pa.

A mine opening having an enlarged chamber below same, a column in chamber, and packing material in unoccupied portion of chamber around pipe, column extending downwardly from chamber to a pumping device with which it is connected.

APPARATUS FOR DRILLING AND OPERATING WELLS.—No. 685,641; J. Reid, Oil City, Pa.

A well drilling and operating apparatus, a continuously running explosive engine having a main drive shaft, a power-transmitting shaft in alignment with main drive shaft, a coupling detachably securing transmitting shaft directly to main shaft end to end and stopping, starting and reversing clutch on transmitting shaft and suitable means to operate clutch extending forward to derrick floor; clutch and operating means consisting of a transmitting pulley or drum loose upon shaft, a reversing gear on shaft thrown into or out of driving relation with pulley or drum, a wheel concentric with shaft and a brake band applied to wheel, a brake band lever for applying brake, a friction clutch forced by a movement longitudinally to shaft into and out of driving

relation with transmitting pulley or drum, a bell crank lever having one end presented in a direction to impart longitudinal movement to clutch, and a rock shaft parallel with continuously rotating shaft having oppositely projecting levers connected respectively with brake band lever and bell crank lever and thereby adapted to impart movements transversely and longitudinally of rotating shaft and throw reversing gear and friction clutch alternately into and out of driving relation to transmitting pulley or drum.

ART OF EXTRACTING GOLD FROM REFRACTORY ORES.—No. 685,691; R. McKnight, New York, N. Y.

Treating refractory ores containing precious metals and a refractory metalloid by pulverizing the ore, mixing with pulverized ore a quantity of haloid salt of an alkaline metal, relative proportions of materials being those quantitatively requisite to produce, when heated in presence of oxygen, a haloid salt of precious metal, and an oxygen salt of alkaline metal and refractory metalloid, roasting mixture with free access of air and agitation at a temperature sufficient to effect reaction mentioned, but shut off from products of combustion until reactions above mentioned are accomplished, and volatilizing and recovering precious metal values as haloids or oxyhaloids.

THE coefficient of friction varies largely with the different kinds of metals, the lubricant, pressure, temperature, velocity. Prof. Thurston's experiments with steel journals running in bronze boxes lubricated with sperm oil, gave some curious results. For instance, with a speed of 30 feet per minute, 200 pounds pressure per square inch, and at a temperature of 90°, the coefficient was .0056. By increasing the temperature to 150°, leaving the other conditions the same, the coefficient rose to .05. Again, with 1200 feet per minute, 200 pounds pressure per square inch, and a temperature of 90°, the coefficient was .01; then by increasing the temperature to 150° without making any other change, it fell to .006. With 100 feet per minute, 50 pounds pressure per square inch, the coefficient was .0037 and did not change when the temperature varied, by 10° to an experiment, from 90° to 150°. There are other instances given in the hundred and over experiments, where the coefficients scattered over a wide expanse, when pressures, temperatures and speeds were changed, the lowest was when the pressure was 100, .0019 pounds per square inch, the speed 100 feet per minute, and the temperature anywhere from 90° to 130°, and the highest, .125, with a pressure of 4 pounds per square inch, speed 30 feet per minute, and the temperature anywhere from 120° to 150°.

Gasoline Hoisting Engine.

Herewith is depicted the latest production of the Weber Gas and Gasoline Engine Co., in a gasoline hoisting engine. They have been building gasoline engines for sixteen years at Kansas City, Mo., and claim ability to make such hoists as illustrated with all the latest improvements. They write that their

hoists are in use at 13,500 feet altitude, and at some points in Mexico and Arizona in mines below sea level. These hoists are fitted with ring oiling main bearings; circuit breakers for prolonging the life of the battery; toggle joint clutch mechanism, designed to prevent any thrust on main shaft; speeding device for controlling the hoisting speed; and indicators, showing the location of load.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

KETCHIKAN.

The Unuk River M., S. & Trans. Co. is a Danville, Ill., corporation, organized under Oklahoma laws, with W. T. Cook, president; J. T. McMillan, secretary, and J. W. Dailey, manager, with office at Ketchikan. This company has bought claims on the Unuk river, about 40 miles upstream. A 25-ton milling and chlorination plant is to be installed next spring. There will be about fifty tons of machinery, which will be towed up the Unak river in flat boats hauled by a steam winch.

At the Iron Crow group at Tolstoi bay, on Prince of Wales island, J. Harvey, manager, says that development has opened a body of rich ore, going about 6% in copper. That is equal to a gross copper value of \$20 a ton, the property being situated on tidewater. The diamond drilling in the Iron Crow group, he states, was not a success through the machinery breaking down. A tunnel on the ore body is in about 20 feet.

VALDEZ.

The economical features of the proposed railroad from Valdez to the Yukon river seem to be such that the undertaking is not as difficult as was originally supposed. The summary of the survey shows that the 130 miles of railway necessary to complete the road to the Kinicott group of copper mines would require but little engineering beyond that of the ordinary mountain road in the more temperate climates. From the copper mines to the Yukon river would be comparatively easy. Engineer Gillette says the highest altitude reached by the line would be 1700 feet. Only one bridge would be required. The cost of construction is estimated by two engineers at \$22,500 and \$25,000 a mile for the construction in the Coast Range, and for the entire length of the line agree on \$15,000 a mile. The Kinicott mine owners claim that they have sufficient ore in sight to justify the expense of building the road, and propose to bring the project before railway promoters of San Francisco, Cal., for action.

ARIZONA.

COCHISE COUNTY.

The combination shaft of the Tombstone Con. Mines at Tombstone is down 500 feet, only 20 feet more remaining to reach the water level. Sinking has been temporarily discontinued. The cutting out of pump stations is being done. At the same time drifts for air are being run to connect with the old workings of the Grand Central and Contention mines.

GILA COUNTY.

C. Kurtz, who has a bond on the Banker group of copper claims near Globe, is taking out ore for shipment.

Larson & Campbell have sold a group of silver-lead claims 8 miles southwest of Bowie to M. E. Kinchila for, it is reported, about \$20,000. The mines have been taken over by the Buckeye M. Co., who propose to install a 50-ton concentrator.

MOHAVE COUNTY.

S. C. Bagg, Supt. of the New Comstock M. Co., reports that the shaft on its mines near Kingman is now below the 125-foot level, in a high grade of gold-bearing ore. The company has leased the Pyramid 20-stamp mill to work ores from the mine.

The option on the Railroad mine, near Chloride, recently given G. H. Hooper, has been taken over by the people representing the Gold Road group. A contract to sink 100 feet on the mine has been let to T. Clark, C. Driscoll and F. Pomeroy.

SANTA CRUZ COUNTY.

A strike has been made on the 50-foot level in the Buena Vista mine at Patagonia of copper glance, running 25% copper and also rich in gold and silver. The pay streak is 18 inches wide.

YAVAPAI COUNTY.

M. R. Kiley of the Oro M. Co., operating gold quartz properties near Minnehaha, reports that 1500 feet of development work has been done. The ore body ranges from 6 to 12 feet wide. A 125-ton reduction plant is under construction.

Hooker & McFarland, who are working the Texas, Black Bart and Iron Rust mines near Jerome, in sinking the shaft, at 90 feet depth cut a 15-foot ledge of ore carrying from 7% to 20% copper.

YUMA COUNTY.

The Colorado River G. & C. Co. of Los Angeles, Cal., has decided to erect a 10-ton smelter on their mine near Parker. J. C. Schelberger of San Pedro, Cal., is manager.

CALIFORNIA.

AMADOR COUNTY.

E. Kuchenbacker has leased the tailings plant at the Central Eureka mine, at Sutter Creek, from W. Dennis.

In drifting on the 800-foot level of the Peerless mine, near Jackson, 2 feet of quartz of fair milling quality have been struck.

CALAVERAS COUNTY.

The gravel mine at Mineral station, near Buckeye, recently discovered by P. Lancelle, has been bonded to P. L. Shuman of the North Star G. M. Co. at \$25,000. Work on the mine has been started.

The Fanny Marie G. M. Co. has bonded the Bluejay and Summit quartz mines, near Jesus Maria, from F. O. Cortmarsh of San Andreas and J. Gnecco of Jesus Maria at \$5000, to be paid in monthly installments of \$500 each. It is proposed to start a tunnel on the vein where backs of 800 feet can be secured.

The Emma mine, near Valley Spring, owned by Brown, Reed & McSorley, has recently been bonded by the McSorley Bros. Machinery is to be put up at once. At present there is a shaft 130 feet deep on the mine. The vein disclosed is 17 feet wide, the fissure being filled with decomposed quartz mixed with slate and other material, the whole of which prospects well. A steam hoist and a 10-stamp mill are being erected.

The American Pacific M. & Dev. Co. has bought the Nigger Hill gravel mine near Campo Seco, and will at once commence active operations. This mine was hydraulicked in early days and paid well. Later exploration has developed a large body of cement gravel on the top of the hill, which will pay by stamp milling. This cement overlies a large body of blue cement gravel. The purpose of the company is at present to work only the upper deposit. A mill is to be erected at once to crush the cement.

The Buena Vista C. M. Co. is the owner of the old Bull Run copper mine, between Valley Spring and Buena Vista, which was exploited during the copper excitement of the early 60's, at which time a shaft 450 feet deep was sunk. The rock prospects well in both copper and gold. It is now proposed to reopen the mine on a large scale.

EL DORADO COUNTY.

At the Josephine mine, Volcanoville, tunnel No. 5 is being advanced 20 to 25 feet a week. Two shifts are employed under the superintendency of J. M. Nougues, Jr.

The Lukens & DuBois claim, near Cool, is being opened up. W. McKoy is Supt.

J. Sipp is reopening his quartz claims near Greenwood. There is a 10-stamp mill on the property.

KERN COUNTY.

The Santa Paula M. & Red. Co., near Randsburg, J. Starr, Supt., has started up its stamp mill.

MARIPOSA COUNTY.

Work on the Pocahontas copper mine, near Mariposa, has been suspended. So far the work has been above water level and is 135 feet deep. Some of the last ore taken out is said to have averaged about 50% copper.

NEVADA COUNTY.

The South Idaho M. Co. has bonded their mine at Grass Valley to J. E. Carter of Grass Valley for two years at \$50,000. The ledge is parallel to the Idaho. No work has been done on the property for the past seven years.

PLACER COUNTY.

The new road to Shady Run quartz mine has been completed. A 5-stamp mill will immediately be installed. The mine, which is on the American river, south of Shady Run, has been prospected by a tunnel run in on the ledge 570 feet. Six crosscuts have been made and the ledge runs from 19 to 36 feet in width. A shaft sunk on the mountain side 212 feet connects with the main tunnel. J. E. Fisher is president of the company.

PLUMAS COUNTY.

At the Jamison mine at Johnstown the important development of the past season is a new ledge struck in an upraise from the drain tunnel level. It carries a good grade of ore.

SAN DIEGO COUNTY.

(Special Correspondence).—A reduction plant of 1000 tons capacity will be put in at the California King Mines Co., on the Colorado river, at Picacho, 20 miles north of Yuma, Ariz. The directors of this company include Senator J. P. Jones of Nevada, ex-Gov. J. B. Grant of Colorado, ex-Senator Pettigrew of South Dakota and ex-Senator S. W. Dorsey. The mine is 4½ miles from the river and is developed by open cuts and quarry work. A railroad, 36-inch gauge, is being built from the mine to the mill. The ore is to be

loaded upon the cars by a steam shovel. The mill will receive the ore from a storage bin at the head of the building, carrying it over a screening device which separates it into two parts, the coarse going to a crusher, thence to a second storage bin; from the latter the material will be fed by automatic feeders to 40x16-inch roughing rolls. From the latter the product will pass to a 16-inch bucket elevator, thence to Colorado Iron Works vibrating screens, which will classify into three sizes. The coarse will be carried back to roughing rolls, the next size going to 54x8-inch high-speed rolls, the finer size to a set of 42x6-inch rolls. The entire product will be thus reduced to 20-mesh, which will be delivered to a system of dust-proof storage bins, to be drawn automatically from the latter to cyanide leaching tanks, of which there are ten, each tank being 40 feet diameter by 5 feet deep. At the conclusion of the leaching and extraction the pulp will be sluiced out through gates. Below the leaching tanks will be a system of gold solution tanks, from which solution can be drawn into zinc boxes for precipitation. The power to operate the mill will comprise five 80 H. P.-return tubular steel boilers and a 24x48 inch Corliss engine. Picacho, Nov. 4.

SHASTA COUNTY.

The Enterprise G., S. & C. M. Co. has been incorporated, to work mines it owns in Pittsburg district; the capital is \$200,000 and the directors are C. Abbott, W. Fluke, H. W. Brooks, W. B. Keeney and C. Stabler of Redding.

J. Lyons and H. W. Carson are not entitled to possession of the Taylor placer claim of twenty acres adjoining the townsite of DeLamar. In the case of M. E. Dittmer and G. W. Girdner vs. Lyons and Carson, for its possession, judgment has been given for plaintiffs.

SISKIYOU COUNTY.

Newkirk & Co. are building a ditch from McKinley creek, near Yreka, to Buckeye Bar, on Klamath river, to be ready when the rains come. The mine is to be worked by an elevator and hydraulic plant.

The Deadwood Placer M. Co. will begin operations shortly by building a hydraulic plant under the supervision of Mr. Graves of Yreka. The intention is to be ready to start this winter.

Martin & Perkins are taking out some very rich ore from the McKinley mine, near Yreka.

The McCook mine, on Punch creek, near Yreka, it is reported, is showing a 3-foot ledge of quartz, which the owners believe will average \$50 per ton.

TRINITY COUNTY.

E. B. Johns of Sherwood, New River district, says the Valencia G. & C. M. Co. has eight claims on the East Fork of New river. The company intends sinking a shaft and doing development work until next spring, when they will erect a small prospecting smelter. The ledge is 30 feet wide and carries copper, gold and silver. The assays show 24% of copper in the ore. In addition to development work, they have made 10 miles of trail. The company also owns gravel bars on New river, and intends putting in a hydraulic plant to operate in the spring.

W. L. Harvey, manager of the Trinity Placer M. Co. operating on Cedar Flat, below Weaverville, says work is being pushed on the Hammer & Kalkhla placer mine, at the junction of the South Fork and Trinity river. The gravel, which is rich, lies in benches, rising from 150 to 850 feet above the river. Twenty-two prospecting shafts and tunnels have been run in the gravel and it runs from 10 cents to \$13.50 a cubic yard.

At the Swanson mine a force of men is drifting and making \$10 a day to the hand.

W. D. Moody has opened the pay streak on his placer mine on New York bar; it pays 25 cents a cubic yard.

The Lappin mine at Deadwood, owned by Cochran, Brady & Tourtellotte, has been sold to Pittsburg capitalists. F. Hollingsworth is superintendent for the new owners, who contemplate the erection of a 10-stamp mill to be run by electricity.

TUOLUMNE COUNTY.

The mill at the Mt. Jefferson mine, near Groveland, has been started up after a shut down of several months. About twenty men are now at work. The new hoist is in working order, the rails in the new shaft are in place and hoisting being done.

W. Symons and J. Sorensen are sinking a shaft on the South Carolina mine at Carters and will make a mill test of thirty or forty tons of ore.

A suit to recover the possession of the Jim Blaine mining claim, near Sonora, has been brought by the Yosemite G. M. & M. Co. against F. F. Britton, F. L. Emerson, R. Van Norton and C. Bigelow.

COLORADO.

CLEAR CREEK COUNTY.

At the Empire tunnel at Georgetown, an average of 6 feet daily is being made.

GILPIN COUNTY.

H. H. Barbee of Denver says the Grand Central G. M. Co. will build a 50 or 100-ton mill to treat the ore from their own mines and to handle custom ores.

The erection of a concentration mill close to the dump of the Bonanza tunnel, near Black Hawk, which intersects the veins in Maryland mountain, is being talked of. The ore bodies opened up in the veins cut, it is claimed, are enough for a 100-ton plant.

SUMMIT COUNTY.

(Special Correspondence).—The Ten Mile L. & M. Co. has holdings amounting to 150 acres at Robinson, and this area includes the old New York group, originally located as a placer property. Prior to 1893 a production of \$318,000 was taken from an ore shoot opened by a shaft on the latter. Work is in progress to get the same ore shoot on its dip at greater depth. The ore produced consists of an iron and lead sulphide carrying 10% to 12% lead and good values in silver and gold. H. M. Shepard of Leadville is Supt.

The Robinson Con. Smelting & Mining Co., which owns 250 acres of mining ground at Robinson, will soon have completed a pyritic smelting plant at the latter place. It is being equipped with three furnaces. This company's mines are pretty well opened up, and the presumption is that their smelting plant will operate mainly on their own ores. Frank Bulkeley is general manager.

The Half Moon is shipping a small tonnage of high-grade ore. It is being operated by Colorado Springs parties.

Robinson, Oct. 29.

TELLER COUNTY.

The Taylor & Brunton people, it is reported, have decided to build a new sampler at Goldfield.

The deepest shaft in Cripple Creek district is the American Eagle, on Bull hill, owned by W. S. Stratton, which is down 1600 feet, where it is connected with the 1300-foot level of the John A. Logan and with the Orpha May. At the present time the ore output from the shaft is five carloads a week.

The Victor G. M. Co. has made arrangements to put an electric hoist on the Indicator claim, adjoining the Victor, at Cripple Creek. At 65 feet depth a good strong vein, that assays from \$18 to \$46 gold to the ton, has been struck.

While digging trenches for pipes in Cripple Creek streets, three veins of quartz were struck, assays from which run from \$30 to \$60 gold to the ton. The veins are from 6 inches to 1 foot in width. The Home M. Co. is exploiting these ledges. T. J. Moynahan, who owns 200 acres of the ground through which these shoots run, has leased it to E. F. Browne of Cripple Creek, at low royalty, with a bonus of \$1000 in cash the day he ships one carload of ore running \$25 to the ton from the property.

Twelve of the forty men employed on the Modoc mine, at Cripple Creek, have been laid off. The reason stated for the suspension is the high rate of smelter charges. The company purposes to break ore and store it with the remaining force until reductions are made in the charges.

A contract has just been let by the Woods Investment Co. for 600 feet of sinking from the tunnel level of the Ingham at Victor. The new shaft will facilitate and cheapen mining and have a better situation for dumping. Its completion will be followed, it is reported, by the installation of a large hoisting plant to sink 2000 feet.

D. Weyand sold to the Mary McKinney Co. the Nisi Prius claim at Cripple Creek, containing an acre of ground for \$4000. It was bought for dumping ground.

The Pinnacle G. M. Co. has started unwatering the main workings of their property, preparatory to resuming work on company account. The main shaft was sunk by Whipp & Glenn, leasers, who shipped ore to the value of over \$250,000.

IDAHO.

BLAINE COUNTY.

The Maggie and U. S. lode claims at Halley have been sold to an Eastern company, for whom F. Mandell is superintendent. The claims are believed to be on the same vein as the Minnie Moore.

J. B. Boyce, of Soldier, has sold to A. McCormick, of Soldier, a quarter interest in the Olympia and Sampson mines, situated in Little Smoky district, for \$6000.

LEMHI COUNTY.

J. E. Hibbs and J. Thompson, owners of the Granite mines, near Salmon, have a dyke of altered granite—sometimes called "satin spar"—which is \$10 and \$12 gold ore.

KOOTENAI COUNTY.

It is reported that a strike has been

on the Weber mine, near Lakeview, of the ore assaying as high as 1000 lbs of silver to the ton.
The Keep Cool mine, near Pend Oreille, the No. 4 tunnel is in 529 feet. The No. 5 tunnel, 100 feet deeper than No. 4, was advanced 650 feet, passing through 250 feet of ore. T. S. Smith of Spokane, Wash., president of the company, says that the mine is now good shape for the erection of a concentrator, and at the meeting of the company in January it will be decided whether to equip the mine with a concentrating plant or to pursue further developments in the way of deep sinking.

SHOSHONE COUNTY.

The American-Commander M. & M. Co., Ltd., has been incorporated with its office at E. J. Clark, president; F. J. Edwards, secretary. The purpose of the company is to develop the American and the Commander claims at Black Lake.

WASHINGTON COUNTY.

Special Correspondence.—Ford Bros. are operating in placer basin at Black Lake. At the latter place the Idaho Gold Coin M. Co., organized by the Fords, owns large surface holdings, with extensive underground development, yielding good veins of ore. The past season a 50-ton cyanide plant was erected. They have also arranged to utilize water power at White Horse falls. Black Lake is the head of Rapid river, in Seven Devils range, the Rapid flowing into the Lake Salmon.

KANSAS.

The reported action of the Union Pacific Railroad in withdrawing from the market nearly 50,000 acres of land in Trego and El counties has attracted attention to the old excitement in western Kansas. A number of chemists have visited the region, claiming as gold bearing and it is reported that some of them declare that the shale along that river will produce from \$10 to \$20 per ton in gold and \$6 to \$10 in silver. Two mills are now building in El county in the district, and Smoky Hill City has grown to considerable proportions in a month. It is said about \$50,000 has been invested in lands of no value for any other purpose. The shale lands extend 50 miles along the river and are on either side.

MONTANA.

CASCADE COUNTY.

Two feet of ore, assaying from 17% to 22% copper, has been struck in the tunnel of the Canyon G. & C. Co., near Canyon Ferry. The new strike was made at a depth of 180 feet.

DEER LODGE COUNTY.

A. Frank and J. M. McDonald of Butte and Omaha associates have bought the quartz claim at the head of Dry Cottonwood creek, near Anaconda, and are putting machinery on it preparatory to extensive development.

GALLATIN COUNTY.

The corundum mines on Camp creek are being worked by McCoy & Klein. It is understood that the operators will ship shipments of ore weekly to Butte.

LEWIS AND CLARKE COUNTY.

A contract has been let by the Snow-C. M. Co., Martin & Canoll of Helena, managers, for 300 feet of tunnel on the McDonald group, near Elliston, on the valley. The new tunnel will open up the lead to a depth of 250 feet.
In addition to the Sunrise mill, near Phillipsburg, has been completed.
The Bellflower, at Phillipsburg, owned by the McLure syndicate, the shaft is down 300 feet and crosscutting to the lead is now in progress.

MADISON COUNTY.

The water power plant now being erected near Red Bluff, when completed, will be one of the largest in the Northwest. The purpose is to supply electrical power at Butte. There will be two generators, each of 5000 H. P. The flume dimensions are 16x10 feet in the clear. It will be miles long and take the entire flow of a river, except in the season of freshets. The plant is nearing completion.
The Fisher & Co. of Butte have bought the Black Chief and Black Boss mines at Pony, owned by Northey & Martin. Operation is to commence immediately.

J. Fine and associates have bonded the fourth of July mines, near Pony.
The Nugget Gulch M. Co. and the Stone Creek M. Co. are about to consolidate as the Bismarck M. & M. Co. A joint stockholders' meeting is to be held in Chicago soon to effect this. It is reported the Stone Creek Co. owns sixteen claims on Stone creek, and the Nugget claims near Twin Bridges, with considerable ore on the dumps.

SILVER BOW COUNTY.

A strike has been made in the Emma mine at Butte, in a new section of the district. The vein is 15 feet in width and assays all the way from \$20 to \$167. It has been decided to sink the shaft 800 feet.

J. A. Murray is working the Ticon mine, near Butte, with P. Delmas Supt. The shaft is down about 400 feet. The development work consists of shafts and drifts, from which ore is being shipped, the returns on which defray expenses of the development. The ore of the Ticon is copper and silver-bearing, the former metal predominating.

NEVADA.

ELKO COUNTY.

Slimes to the amount of 30,000 tons, estimated to contain about \$200,000, are piled up by the Dexter M. Co. at Tuscarora, waiting for some metallurgist to undertake the treatment, so states President J. Dern. A sampling of the slimes showed nearly \$7 gold per ton.

HUMBOLDT COUNTY.

A strike is reported in the Anderson mine, near Mill City. The mine is being operated by a Boston, Mass., company, with F. H. Lowe as manager. An assay of the ore is reported to have returned \$107.60 silver and \$34 gold. The tunnel is in 130 feet.

LANDER COUNTY.

The Gold Park M. & M. Co., with works at Gold Park and office at Austin, has been incorporated with \$1,000,000 capital; T. H. Dalton is president of the company.

NEW MEXICO.

BERNALILLO COUNTY.

The Jura-Trias Co. has completed its copper smelter at Senorita. It owns four copper claims, with considerable development work upon them. The ore ranges from 7% to 25% copper.

COLFAX COUNTY.

(Special Correspondence).—The Ohio G. M. Co. will erect a 50-ton pneumatic cyanide reduction plant on their property at Elizabethtown. C. E. Fueller, M. E., of Denver, Colo., was on the ground last week selecting a site and making preliminary plans for the mill.
Elizabethtown, Nov. 3.

OTERO COUNTY.

T. A. Kelly has leased the Mamie Baird mine at Jarilla and started work on it.

The Jarilla Copper Co. is drifting on the first level on good copper ore and sinking the shaft to the second level.

The Altamont M. Co., at Jarilla, has its shaft down 200 feet and has 10 inches of high-grade silver and lead ore which runs over 4000 ounces silver and 17% lead per ton. The company has installed a gasoline hoist.

SANTA FE COUNTY.

The San Lazarus M. Co., \$5,000,000 capital, has been incorporated to work the San Lazarus group of fourteen claims in the southern part of Santa Fe county, on which it has already expended \$130,000. The office of the company will be at Milwaukee, Wis.

The Belle Royal M. Co. owns ninety acres of mineral land in the Bromide district. Assays give returns of 15% to 25% copper, ten ounces silver and smaller values in gold to the ton.

SOCORRO COUNTY.

The Little Charlie mines, in the Mogollon district, will be operated by the Mogollon G. & C. Co.

OREGON.

BAKER COUNTY.

E. A. Frenzel of California has bought the Tempest mine, in the Greenhorn district, near Baker City. Mr. Frenzel will erect a concentrating plant for the ores. He has also bought 320 acres of placer gold ground on Gold creek, together with water rights.

GRANT COUNTY.

A new ledge has been struck in the Cougar mine, near Granite. It is about 180 feet west of the present vein, and averages \$7 to \$21 to the ton. The lower tunnel is in 1050 feet, and will be advanced 300 feet from the present face, when a 475-foot upraise to the surface will be made. The cyanide plant will not be operated this season.

The Phoenix mine, near Granite, has been sold to Eastern people represented by W. R. Crawford. There is over 1000 feet of development on the Phoenix, 2300 tons of ore on the dumps and the 10-foot ledge, it is said, averages \$35 clear across. The price paid was about \$80,000. A 10-stamp mill will be erected at once.

JACKSON COUNTY.

H. A. Corliss has sold his placer mines in Dry Diggings district, near Gold Hill, to a Chicago company represented by C.

W. Ament for, it is reported, \$20,000.

Mr. Corliss is superintendent.
The Williamsburg M. Co. of Grants Pass has been incorporated, capital \$500,000, by F. E. Forbes, T. J. McClung, Robert G. Smith and L. A. Heberlie.

J. N. Hayes has rented his Sardine creek placer mines, near Jacksonville, to Medford people and is developing a quartz ledge, near Gold Hill, 5 feet wide, which 50 feet down assays \$24.08 copper and \$23.44 gold per ton.

Reed & Fletcher of Gold Hill, while developing one of their cinnabar claims in Meadows district, it is said, have cut through a 20-inch vein of good coal. The bed lies at a depth of 112 feet.

JOSEPHINE COUNTY.

B. F. Walker of Yreka, Cal., superintendent of a hydraulic mine at Althouse, says he is ready at the mine for the water to start operations.

LANE COUNTY.

The railway from Cottage Grove to the Bohemia district, about 40 miles distant, will open up a promising mining district. With the railway, ore can be brought to the smelters cheaply. Several hundred thousand dollars have been extracted from free-milling ores at Bohemia, but in depth sulphide ores predominate, with increased values. The Helena mine, since April 1, 1900, has paid \$104,000 dividends.

SOUTH DAKOTA.

LAWRENCE COUNTY.

D. N. Heizer and J. K. Vanatta of Denver, Colo., are in Deadwood preparing to immediately rebuild the burned plant of the Spearfish G. M. & R. Co. The loss was \$50,000; insurance, \$25,000. The old mill will be duplicated throughout. It will not be ready to run before next spring. The Spearfish Co. owns about 400 acres of mining land in the Spearfish mining district, 12 miles west of Deadwood.

The annual report of the Homestake M. Co. for the fiscal year ended May 31, 1900, shows total of ore milled at the five mills 935,441 tons, which netted \$3,588,654 on the plates, \$48,305 in concentrates and \$2,272 in siliceous ore, making a total of \$3,639,232 for the total output of the mine. The company paid out for mine labor \$1,226,143 and for mill and hoisting plant labor \$174,942. The amount paid for mine timbers was \$242,727, lumber \$8987, coal \$251,995, powder \$127,267, quicksilver \$9707 and candles \$26,700. The bullion averages about \$15 per ounce at New York. The company has paid a dividend of \$1,260,000 for the year. The 1200-ton cyanide plant was built at a cost of about \$300,000, and the water system of bringing into the city water from Spearfish creek, at a cost of \$1,000,000, was completed. At Terraville the old Caledonia stamp mill was repaired and twenty stamps added. The average yield per ton was \$3.90 in gold. Practically all of the values in the ore are now saved. The report was for the year previous to the commissioning of the 1200-ton cyanide plant, which is saving about 95 cents that formerly went down with the tailings into the creek.

The Dakota M. Co. will enlarge its 100-ton cyanide plant at Deadwood by ten additional stamps, increasing capacity to 150 tons. The ore comes from the company's mines in the Portland district, 6 miles west of Deadwood.

UTAH.

IRON COUNTY.

W. J. Halloran of Salt Lake City is at Stateline with reference to the erection of a mill to work the Johnny mine.

SALT LAKE COUNTY.

The capitalization of the United States M. Co. at Bingham and the Centennial-Eureka of Tintic has been increased from \$10,000,000 to \$12,500,000.

The Goodsell M. & M. Co. has been incorporated, capital \$350,000, with B. W. Goodsell president and W. L. Goodsell secretary. The company owns the Hot Stuff claim in the American Fork mining district.

The Alabama M. Co. has been incorporated, capital \$10,000, with C. D. Rogers as president and C. M. Nielsen secretary and treasurer, with office in Salt Lake City. The company owns the Legal Light claims Nos. 1, 2, 3 and 4, in Bear canyon, near Draper.

In the Lavinia, at Alta, the tunnel, in 500 feet, has developed 3 feet of ore that averages 25% lead and twenty-five ounces silver, with a small amount of gold. The ore occurs on the hanging wall, while on the foot wall are 30 inches of ore that averages 15% copper and values in silver and gold.

SUMMIT COUNTY.

The Daly-Judge M. Co. has been incorporated in New Jersey, to operate on Bonanza Flat, near Park City. In the organization of the new company J. J. Daly, A. Fowler and O. J. Salisbury of Salt Lake City, H. O. Hanke of Cincinnati,

Ohio, A. C. Wall of New Jersey and E. H. Wood of New York are directors. J. J. Daly is president and G. W. Lambourne secretary. The new company owns fourteen full claims and part interests in a number of other adjacent ones.

WASHINGTON COUNTY.

S. Williams and S. S. Jones of Provo have bought the Surprise copper and lead mine at St. George and will build reduction works there.

WASHINGTON.

FERRY COUNTY.

J. Wyatt, Supt. of the Mountain Lion at Republic, says that the pump will be taken out of the lower level of the mine and, to save expense, the mine has been closed down and will not be reopened until transportation to the smelters is available, when it will require more than two weeks to pump it out. He says there are 15,000 tons of ore in the stopes ready to put into the cars.

OKANOGAN COUNTY.

R. Insinger, secretary at Spokane of the American Flag Co., operating in the Metkow district, states that the recently installed 20-stamp mill is in successful operation, making its first run.

SKYKOMISH COUNTY.

The Bunker Hill-Sullivan M. & Con. Co., who own the Copper Bell mine near Index, are installing an engine, boiler and air compressor plant for developing and exploiting the property on an extensive scale.

WYOMING.

CARBON COUNTY.

The owners of the new Rambler copper mine, in the Douglas Creek district, near Encampment, will, it is reported, make a contract with the Encampment smelter for an aerial tramway over 30 miles in length, to cost \$250,000.

It has been discovered that the dump of the Doane Rambler mine at Battle Lake contains about \$10 a ton, and the Battle Lake Tunnel Site Co. will work it. G. Doane, the original owner of the Rambler, worked the mine with coal miners, who shot the ore down in such fine particles that thousands of tons were carried out to the dump as waste. Recent assays have shown that the ore on the dump contains \$1.50 gold to the ton, \$2.40 silver and \$7 copper. There are about 9000 tons of ore in the dump, which is valued at \$90,000. It will cost half of this to reduce it to matte.

A strike of copper has been made in the Ottumwa mine, in the French Creek district, near Laramie. Assays show that the ore runs 20% copper and \$1.46 in gold to the ton.

Copper has been discovered on Rock creek, near Kemmerer. The find is black oxide of copper.

FOREIGN.

BRITISH COLUMBIA.

L. S. Austin, Supt. of the Sullivan Mines Smelter at Marysville, East Kootenay, says there will be two lead smelting furnaces, each of 125 tons capacity daily, and six or eight long-bedded hand roasting furnaces. A waterfall capable of developing 600 H. P. will be utilized for running the machinery and the plant will be ready to blow in by March 1, 1902.

The Snowshoe mine at Phoenix, A. J. McMillan managing director, has developed large bodies of ore, and the management is considering the question of treatment. The Snowshoe has shipped from 1500 to 1600 tons of ore to the Greenwood smelter, but it is understood the Snowshoe Co. propose erecting a smelting plant to treat its own ores.

M. B. Webber and associates of Winona, Minn., have bonded from T. Horn and H. N. Coursier of Revelstoke the Black Warrior group, in McDonald creek basin, upon which considerable work has been done. The price is \$60,000; time, two years. S. Shannon has been appointed Supt., and development work and shipments will be made during the winter.

W. Bailey, owning a ranch near the mouth of Wild Horse creek, has begun a suit and asked an injunction to restrain the placer companies now operating on Wild Horse creek from discharging mining debris in the river. The defendants to the suit are The Invicta G. M. Ltd., The Nip & Tuck Hy. M. Co., East Kootenay Consols, Ltd. (foreign company), The Quong Young Tong Co., Chow Dek and Chow Quen (Chinese companies).

DUTCH EAST INDIES.

C. H. Hand, mining engineer of Butte, Mont., who has been examining gold and copper mines in the Dutch East Indies, says of mineral resources in the northern peninsula of Celebes that he found some copper properties which promise to develop into exceedingly rich mines; but, as very little development work has been

done, it is impossible to tell much about them. It is the same with the gold properties. The native Malays have been digging gold in that country for many years, but when they came to water they abandoned their diggings. They have uncovered some ledges showing ore going from \$8 to \$40 a ton, and some of these mines are now being worked under concessions from the Dutch Government.

KLONDIKE.

It is reported that Indiana people are buying up interests on Gold hill, at the mouth of El Dorado, and intend to hydraulic the ground. Two large plants have been bought, water rights have been secured and six creek claims obtained for dumping ground. The whole frontage of Big Skookum, Bonanza and El Dorado has been secured. A number of dumps on the ground that were not washed up during the summer for lack of water have been tested, and it is estimated that they will yield at least \$150,000. A sluice head on Gold hill cost the miners \$14 per hour in the summer of 1900.

A new Klondike strike is reported on Conglomerate creek, a tributary of Montana creek.

MEXICO.

(Special Correspondence).—The Palmarijo & Mexican Gold Fields, Ltd., T. H. Oxniam manager, is overhauling its plant at Zapote and preparing to change the method of ore treatment about Dec. 1.

J. H. Furman and S. G. Burn have bought the Ramos mines for an English company represented by them. The mines include the El Durazno, Tetamoa and the San Agustine groups.

The White Chief M. & M. Co. have reduced their working force about half.

The Guazapares M. & M. Co. is starting the construction of its mill.

Zapote, Sonora, Oct. 22.

Cananea rancho, consisting of 350,000 acres, has been sold to the Greene Con. Copper M. Co. by George C. Perkins of San Francisco and associates. The rancho extends from the Arizona boundary south into the State of Sonora, and contains within it the Cananea copper mines. The price paid for the rancho, it is said, was about \$350,000.

The Emerald M. & S. Co., W. R. Ramsdell of San Diego, Cal., manager, is operating copper mines at Santa Catrina, Lower California. The company has recently bought a lot of anchors, one weighing 10,000 pounds, two of 3000 pounds, and two of 3500 pounds. The four smaller anchors are for mooring vessels at Santa Catrina to load with copper ore, and the large anchor is to fasten the cable upon which buckets laden with ore will travel from the shore to the vessels. This cable will be anchored some distance from the shore and when a vessel comes to load the cable will pass between the masts. As the buckets reach a point over the hold of the vessel they will be emptied and then returned to the shore to be refilled. By this means from 200 to 300 tons of ore can be put on board a vessel in one day. For over a year the company has been at work developing its mine, and now has about 150 men employed. A tramroad is being built from the mines to the coast. As soon as the preliminary work is completed the company expect to ship at least 2000 tons of ore a month to smelting works at San Francisco. On the vessel reaching Ensenada every cargo has to be sampled and a charge of \$2 (Mexican) is levied on every ton, being what is known under the Mexican laws as a traffic tax.

The Cieneguita Co., consisting of Phoenix and Tucson, Ariz., people, is arranging to work their Chipiona and other mines in the Sahuaripa district of Sonora. A. Hendy is manager at Nogales.

PERU.

Butte, Mont., and New York City people, associated with A. W. McCune of Salt Lake City, Utah, it is reported, have arranged to purchase the Sierra de Pasco silver and copper mines in the Andes mountains, 210 miles from Lima. The company has a capital of \$10,000,000. The mine has been worked by natives for 271 years, and it is claimed that fully \$1,000,000,000 have been taken out in silver, but immense deposits of copper ore remain untouched. The silver ore is high grade, but the copper is not. Mr. McCune, it is said, will be manager of the property.

Catalogues Received.

The Taylor Iron and Steel Co., of High Bridge, N. J., has issued Catalogue A, describing and illustrating its special lines of manufactures in manganese and chrome steel. These consist of wearing parts of many mechanical appliances used about mining and mill plants. The Taylor Iron and Steel Co. will be pleased to mail the catalogue on application for it.

Personal.

W. G. FILER of Salt Lake City, Utah, is at Redding, Cal.

WALTER SMITH is now Supt. Sedalia mine, Salida, Colo.

CLARENCE HERSEY has returned from Utah to Leadville, Colo.

A. C. BEATTIE, M. E., of Denver, Colo., is away on a trip to Mexico.

F. S. ROUMAGE of Auburn, Cal., is sojourning in San Francisco.

A. T. AMES, the pump manufacturer of Galt, Cal., is in San Francisco.

E. RAMMELMEYER is the new Supt. of the New Fairview M. Co., Fairview, B. C.

A. P. FORBES, a mining engineer, has gone from San Francisco to Ocatla, Mexico.

H. BRATNOBER, who was at Rosslund, B. C., for several weeks, has gone to London.

R. G. PARKER of Boston, Mass., is examining copper prospects in northern California.

E. M. BIND, who has been at Torreon, Coahuila, Mexico, for some time, is now in New York.

G. A. BIGELOW has returned to San Francisco from Nome, where he spent two seasons.

R. H. CAMPBELL, formerly of Etna, Siskiyou county, Cal., is at Harpers' Camp, B. C.

O. P. POSEY, manager Bingham Con. Smelter at Bingham Junction, Utah, is in Chicago, Ill.

J. W. ASTLEY has been appointed superintendent of the Snowshoe mine, at Phoenix, B. C.

C. L. DOOLEY has returned to Michigan Bluff, Cal., from a year's absence engaged in mining in Siberia.

M. M. JOHNSON has returned to Salt Lake City, Utah, after several weeks' sojourn in New York.

J. HARVEY, Supt. Iron Crow copper mine, near Ketchikan, Alaska, is sojourning at Spokane, Wash.

EDW. PEACOCK has assumed the superintendency of the Bristol Copper Co.'s property near Pioche, Nev.

A. E. RITER of Hope, Idaho, visited Dixie, Idaho, this week to examine some property for Spokane men.

R. E. HANLEY, of the Niagara mine, French Gulch, Cal., is now Supt. Shasta King mine, Shasta Co., Cal.

P. L. YOUNG has returned to Orleans, Cal., from a reconnaissance of the Portuguese, East Africa, gold coast.

J. H. COX of Denver will make a reconnaissance of the Congo river country, Africa, for the Venture Exploration Co.

BELA KADISH has resigned as Supt. Le Roi smelter at Northport, Wash. Oscar Szontagh is his probable successor.

EDW. MANION has resigned the superintendency of the Gopher mine, Hill City, S. D., to be Supt. Clyde mine, Victor, Colo.

N. E. LINSLEY, M. E., has returned to Spokane, Wash., from an examination of the North Fork coal fields, near Phoenix, B. C.

W. E. SHARON succeeds Albert Lackey in the superintendency of the Overman and Caledonia mines, Virginia City, Nevada.

E. L. LEAVER of Chas. Butters & Co. is building a reduction works at Virginia City, Nev., for utilizing the lixiviation process.

M. FONTAINE of Paris, France, is at Clifton, Ariz., engaged in inspecting the mines of the Clifton Consolidated Copper Mines, Ltd.

E. K. STEVENOT has returned from San Francisco to the Oriole mine, Calaveras Co., Cal., where he is superintending operations.

LEO VON ROSENBERG of New York is examining a copper property near Hawthorne, Nev., and expects to be in California next week.

LEWIS SCHATZ, erecting engineer for the Allis-Chalmers Co., is putting in a blowing engine for the Mountain Copper Co. at Keswick, Cal.

W. N. WILBUR, formerly of Yreka, Cal., is now engineer for the Golden District P. M. Co., in the Mount Baker district, Washington.

J. O. HARRON of the firm of Harron, Rickard & McCone, successors to the Parke & Lacy Co., returns to San Francisco from an Eastern trip this week.

P. OREN of Butte, Mont., has gone to Peru in charge of a party of expert miners to open the Cerro del Pasco mines for the New York company lately organized.

E. H. BENJAMIN, secretary California State Miners' Association, has gone to the city of Mexico, where he will attend the

annual meeting of the American Institute of Mining Engineers.

COLONEL C. E. L. B. DAVIS, COLONEL W. H. HEUER and MAJOR W. E. BIRKHEIMER of the United States Engineer Corps have gone from San Francisco to Manila to examine proposed improvements in the Philippines.

Commercial Paragraphs.

C. M. FUELLER has opened an assay and testing plant in Denver, Colo.

McFARLANE & Co., Denver, Colo., are building a stamp mill for the Idaho Springs Mining & Reduction Co.

HENRY ENGELS, 421 Market St., San Francisco, Cal., is the Pacific coast representative of the Chicago Pneumatic Tool Co., Monadnock Block, Chicago, Ill.

THE Compressed Air Machinery Co. expect to occupy their new five-story building, southeast corner First and Stevenson Sts., San Francisco, Cal., next month.

THE Colorado Iron Works have completed a concentrating and lixiviation plant for the San Luis M. Co., at Panuco de Coronado, Durango, Mexico, and a modern concentrating plant of 1000 tons daily capacity, for the Federal Lead Co., at Flat River, Mo.

THE S. Morgan Smith Co., York, Pa., has an order for six single 39-inch and one 18-inch McCormick turbines from the Metabetchouan Pulp Co., Quebec, each mounted in an iron flume connected to a supply pipe 16 feet diameter. Five of the 39-inch turbines will develop 4000 H. P. and drive ten pulp grinders. Another of same size will drive the wet machines, screens and other machinery. The 18-inch will operate a dynamo, head 46 feet. The mill will have a daily capacity of sixty tons pulp, dry weight.

THE New Process Raw Hide Co., Syracuse, N. Y., through its English agents, Messrs. Geo. Angus & Co., has received during the month of October trial orders for its new process noiseless pinions from eleven electric railway companies in Great Britain. The company reports its trade in the general machinery line as steadily increasing, especially in the case of motor-driven machine tools where noiselessness is essential. Since the company's announcement a couple of months ago that it is in position to furnish accurately cut metal gears also, the number of orders received for work in this line has been gratifying and point to an extended trade.

Recently Declared Mining Dividends.

Books Received.

"Micrometrical Observations of the Double Stars Discovered at Pulkowa Made at the University of California," by

W. J. Hussey, Astronomer. Vol. quarto, 225 pages. The work consists of a record of observations of double stars and their movements; of interest to astronomers. Published by University of California, Berkeley, Cal.

Latest Market Report.

SAN FRANCISCO, Nov. 7, 1900.

SILVER.—Per oz., Troy: London, 26½d (standard ounce, 925 fine); New York, bar silver, 57½c (1000 fine); San Francisco, 57½c; Mexican dollars, San Francisco, 45½c New York.

COPPER.—New York: Lake, 15 casks, \$17.25; carload lots, \$17.00; electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62; Casting, 1 to 3 casks, \$16.00; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c. London: £64 17s 6d per ton.

LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco, \$4.90, carload lots; 5½c 1000 to 2000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, 25. London, £11 8s 9d per ton—2.46 cts. per lb.

SPELTER.—New York, \$4.25; St. Louis, \$3.75; London, £16 2s 6d per ton—3.58½ cts. per lb; San Francisco, 10½c; 100-lb lots, 6c.

ANTIMONY.—New York, Cook's, 10c; Hallett's, 9c; San Francisco, 100-lb. lots, 10c; 300 to 500 lbs., 11c; 1-lb. lots, 13½c.

IRON.—Pittsburg, Bessemer pig, \$1.00; gray forge, \$1.00; San Francisco, bar per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

NICKEL.—New York, 50¢@60¢.

TIN.—New York, pig, \$27.50; San Francisco, ton lots, 28c; 1000 lbs., 28½¢; 500 lbs., 28½¢; 200 lbs., 28½¢; less, 29c; better, 30c.

QUICKSILVER.—New York, \$1.00; large lots; London, £9 2s 6d; San Francisco, local, \$47.50 per flask of 76½ lbs. Export, \$45.00.

MAGNESIUM.—New York, \$2.90; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 7c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 100% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 18½c; 15.25c.

PHOSPHORUS.—F. o. b. New York, 50¢@60¢.

ASSAY LITHARGE.—San Francisco, 10c per lb., small lots.

PLATINUM.—San Francisco, 100-lb. lots, \$19 per oz.; New York, \$20.50 per Tr. oz.

BISMUTH.—New York, 30¢, 2.25¢; 50-lb. lots; San Francisco, \$2.50 to \$3.50 per lb.

FERRO-MANGANESE.—Pittsburg, 80% domestic, \$58.50, large lots.

TUNGSTEN.—New York, \$1.50.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in 100-lb. lots, 15½c; less than one ton, 17½c. No. 1½, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 60%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2½, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9½c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 72½¢.

SITUATIONS WANTED.

YOUNG MINING AND MECHANICAL ENGINEER would like position in office as draughtsman, etc. accustomed to turning out artistic mapping. Gold field and mine surveyor. Box 92, this office.

Competent Ore Sampler desires position; can take entire charge, handle men; understands moisture, pump and all details; can assist in office work; with figures; sober and pay strict attention to business; fifteen years' Colorado experience. Success in family reason for desiring change. References. Address W. G. B., care this office.

WANTED.—A position by a first-class all-round millman. Understands amalgamating and concentrating and care of mills. Twenty-five years' practical experience. Arizona or Mexico preferred. Satisfactory references given. Address "Millman" care Mining and

ASSESSMENT NOTICES.

MOHICAN MINING & MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of November, 1901, an assessment (No. 2) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 300 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3d day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
JNO W. CLASSEN, Secretary.
Office—No. 300 California street, San Francisco, California.

THE CALIFORNIA DREDGING COMPANY.—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 23rd day of October, 1901, an assessment (No. 3) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, 120 Sutter Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 25th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of December, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary.
120 Sutter Street, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of October, 1901, an assessment of five (5) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No 323 of the Parrott building, Nos. 825 to 855 Market street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 25th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23rd day of December, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
J. C. ANTHONY, Secretary.
Office—Room 323, Parrott building, Nos. 825 to 855 Market street, San Francisco, California.

THE THORPE MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fourth Crossling, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of October, 1901, an assessment (No. 11) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 632 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 9th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
A. F. FRBY, Secretary.
Office—632 Sacramento street, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Local place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of October, 1901, an assessment (No. 1) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 18th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
EDWARD H. STEARNS, Secretary.
Office—Room 801, Claus Spreckels Building, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION. having received applications to mine by the hydraulic process from N. Gilman, in the American House Mine, at the American House, Plumas Co., to deposit tailings in a ravine below the mine; from Jas. A. Modglin, in the Old Gardiner's Point Diggings, near Fort Wine, Sierra Co., to deposit tailings in Saw Mill Ravine; from the California Company, in the North Hill Placer Mine, near Milton, Calaveras Co., to deposit tailings in Rich Gulch; and from L. V. Tefft, in the Lone Star Mine, near Cromberg, Plumas Co., to deposit tailings in Jackson Creek, gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on November 11, 1901, at 1:30 P. M.

MICA AXLE GREASE

Makes short roads.

and light loads.

Good for everything
that runs on wheels.

Sold Everywhere.

Made by STANDARD OIL CO.

ONCE IN A LIFE TIME

is often enough to do some things. It's often enough to buy a wagon if you buy the right kind. The

ELECTRIC HANDY WAGON

lasts that long under ordinary conditions. First the life of a wagon depends upon the wheels. This one is equipped with our Electric Steel Wheels, with straight or stagger spokes and wide tires. Wheels any height from 24 to 60 in. It lasts because tires can't get loose, no re-setting, hubs can't crack or spokes become loose, felloes can't rot, swell or dry out. Angle steel hounds.

THOUSANDS NOW IN DAILY USE.
Don't buy a wagon until you get our free book, "Farm Savings."
ELECTRIC WHEEL CO., Box 239, Quincy, Ills.

Labor Saving Devices

enable us to produce high grade lamps at the right price.

CALIFORNIA ELECTRICAL WORKS, 547 Mission St., San Francisco.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

Patented Dec. 5, 1899; May 29, 1900.

THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

“THE DANIEL BEST”

50-Horse Power Traction Engine.

Freight carrying capacity of wagons,
16 TONS EACH,
or a total capacity of train,
48 TONS.

CAPACITY
OF
ENGINE,
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

"DUSED AU'S" FAMOUS ROCKING SADDLE. ENORMOUS SAVING IN ROPE.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

DICKSON MFG. CO., Scranton.

MANUFACTURER OF

Mining Machinery

There are
reasons
why

the adjustable and practically indestructible GATES ROCK AND ORE BREAKERS produce crushed material at a much lower cost per ton than other breakers. To more than 5,000 users located in all parts of the world, the cause is readily apparent. Gates Breakers not only have much greater capacity, require less power, run without vibration, stoppage or delay, with less wear on the crushing surfaces and permitting carloads of material to be dumped directly into the hopper of breaker, thus reducing the employment of handling devices and manual labor to the minimum, but other convincing reasons supported by indisputable evidence of the superiority of Gates Breakers are given in Gates Catalogue No. 1. Avoid a false start and possibility of failure. There is absolutely no breaker made that will compare with the "Gates."

We are prepared to build crushing plants complete, screens and perforated metal of all kinds, elevators, hoists, engines, and boilers. We also build cement machinery of the latest designs. ESTIMATES FURNISHED UPON APPLICATION.

PACIFIC COAST RUBBER CO.,

21 FIRST STREET, SAN FRANCISCO, CAL.

Corrugated Pneumatic Hose.

Made absolutely seamless in the fabric as well as in the cover. So constructed as to form, practically, a compact body. No splitting of the tube and opening of the plies, much lighter and more pliable, and will stand shorter bends without kinking than hose made in the ordinary way; will withstand a greater air pressure than any hose double its weight offered on the market. We guarantee this hose to outwear any other style or make of hose for the conducting of air under pressure, whether for drills, hoists or pneumatic tools, and we are satisfied, beyond any doubt, that for this work it is by far the most desirable and economical hose manufactured.

Plain; Wound with Flat or Round Wire; or Covered with Woven Marline Jacket. Sizes 3-8, 1-2, 3-4 and 1 Inch.

FIRTH'S DRILL STEEL.

EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeannesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeannesville Pumps.

We claim that in Jeannesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

DEWEY, STRONG & CO.

(ESTABLISHED 1860.)

SAN FRANCISCO, CALIFORNIA,
and WASHINGTON, D. C.

OLDEST AND LARGEST AGENCY ON
THE PACIFIC COAST.

WHY TO BE PREFERRED?

BECAUSE--

Inventors have the opportunity to explain their inventions personally and directly to the men who write the specifications and make the drawings, so that all the inventor's ideas will be correctly conveyed, avoiding mistakes and vexatious delays.

Inventors living at a distance from San Francisco may, where they so desire, consult directly with our Washington office.

Inventors receive the benefit of over thirty years' continuous, successful experience.

A description of the patented invention will appear in the *Mining and Scientific Press*.

We have a complete Patent Library, including official records since 1793 and full certified copies of all patents issued since 1872. These are for free examination by any one who desires. We attend to all business connected with patents, such as the preparation of Caveats, Trade-Marks, Design Patents, Assignments, Licenses and Agreements. We make examinations as to the patentability of inventions, searches, and give opinions as to infringements, or the scope or validity of Patents. Our Branch Offices and arrangements for Foreign Patents, Trade-Marks, etc., are very extensive and complete. Inventors' Guide sent free on application.

A PROSPECTOR'S or MINER'S EQUIPMENT IS NOT COMPLETE WITHOUT AN EDSON OUTFIT.

EDSON'S OUTFITS
—IN—
OPERATION.

CAPACITY, 1000 GALLONS per hour to 6000 GALLONS per hour. ONE-MAN and TWO-MAN POWER. (For full information by mail, Cable word "ZABARRO.")

SEND FOR BOOKLET "M7"

IT CONSISTS OF

EDSON POWERFUL DIAPHRAGM
FORCE PUMP,

that will pump Sand, Gravel, Tailings,
Slime, or anything liquid enough to flow;

EDSON SPECIAL SUCTION AND
CONDUCTING HOSE,

that will withstand mineral action and climatic influences, besides the wear and tear of mining operations, and rough, mountainous journeys;

EDSON EXTRA HEAVY
COUPLINGS,

that are made especially for the Hose and Pump. Do not wear away at the joints so as to cause leakage. Troublesome delays, besides expenses for repairs are avoided;

STRAINER and SPANNERS,
All Complete,

ready for IMMEDIATE USE.

FULDA TANK MANUFACTORY AND PLANING MILLS,

30 to 40 SPEAR ST., Bet. Market and Mission,
SAN FRANCISCO, CAL.

NON-SHRINKABLE TANKS,
Mining, Water, Oil, Railroad and Wine.

GENERAL MILL WORK AND MOULDINGS.

We claim the Non-Shrinkable Tank with water channels to be the most perfect in the market. There are two transverse holes all around the tank in the middle of the stave, one near the top and one near the bottom. The staves are all grooved from the top hole to the bottom hole, which insures the filling of water between every stave. This will keep the staves water-soaked without regard to whether there is water in the tank or not, so the oil can be pumped completely out of the tank and left to stand for a period; and when the tank is again filled with oil there will be a tight tank, because of the water in the channels and transverse holes of the staves keeping them moist and prevents leaking. There is no possibility for the water to mix with the oil, because the water can be discharged to whatever place is desired.

In mining tanks there is no loss of solution with these water channels.

Don't Take Chances

finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

P & B

Whenever you see these letters on a roll of roofing, you can depend upon the quality and usefulness of the roofing contained in the roll.

P & B Ready Roofing is a roofing for any building in any climate, and is used in every part of the civilized world.

P & B Ready Roofing cannot be injured by the sun, wind, rain, snow, smoke, gases, acids and vapors, or anything else that is likely to interfere with roofings.

It is a roofing that is made of the very best possible materials, in the most accurate and painstaking way—made after years of experimenting and tests, and made to outlast and outwear every other roofing.

If you want to know the many reasons for its strength, durability and convenience over other roofings, send for our booklet. Address department A for a quick reply.

The Lunkenheimer "CHAMPION" Rod Oil Cup,

Suitable for all movable bearings, is simple and practical in construction and can be filled without detaching plug. Glass sides show stage of oil. Attach Cup so that the glass sides are parallel with the rod. When cup is in motion the oil begins to travel in a body within the cup, and at each revolution is thrown against the feed tube and flows down through it to the bearing. The centrifugal force, combined with the shape of the body, carries the oil to the holes in the feed tube. Made in four sizes, holding from 1½ to 12 ounces of oil. A trial solicited and satisfaction guaranteed. Write for catalogue of superior brass and iron steam specialties. Specify "Lunkenheimer" make and order from your dealer.

Mineral Resources of Arizona.

A striking feature of the general interest attracted to mining during the last half dozen years has been the renaissance of Arizona mines. A widely extended and profitable mining industry has been developed from a supposedly decadent industry. The criticism of unsuccessful miners who did not dig down, that Arizona mines had no depth, has been disproved by the now successful miners who have dug mines down to great depths. At the same time Arizona mines have been found to have great breadth as well as depth. The mines are notable for the enormous ore bodies that extended working has disclosed.

The great change in Arizona mines from what they were a dozen years since to what they are now can be attributed principally to the increased value of copper and to the improvements in modern metallurgical methods. The increased value of copper made ores, formerly unavailable, commercially desirable. Improved metallurgy cheapened the cost of their treatment and increased the margin of possible profit.

Old mines—the great silver and gold producers of twenty and thirty years ago—have been reopened to work greater depths, and to secure the copper-bearing ores that were then left in the mine as too base or too low grade to justify mining and treatment for the gold and silver they carried. Now these ores are the basis of a greater mining industry than their appearance was supposed to have destroyed.

The physical conditions make Arizona mineral de-

advantage over most copper mines in other districts. Also, as the sulphide ores are reached with depth, they are found to average high in copper and to carry, as a rule, exceedingly high values in gold and silver, notably the former.

Much of the mining work going on in Arizona dur-

same kind of a record of free-milling exploitation of upper levels and abandonment by reason of the incoming of water with depth or the exhaustion of the first bonanza ore body.

It used to be said, once a silver mine always a silver mine. Now the experience accumulated in Arizona and other Western mines, which for a time was supposed to disprove it, has confirmed and rather improved it. The once silver mines are not only still silver mines, but they are copper mines and gold mines as well.

The new Arizona mining is different from the old, which had considerable of the effect of Mexican association in its methods. The mines were worked near the surface and for high-grade ores only. When the high-grade ore deposit was exhausted, the mining stopped. The new Arizona mining is availing itself of the methods that have proved effective in other regions. Deep shafts are being sunk and the best types of hoisting and pumping machinery are being installed. Milling and smelting plants are being built to save all the different values the complex ores contain. Mining is being made a business of manufacturing rather than an opportunity for gambling. It cannot help being made a profitable business. Copper can be manufactured very cheaply in Arizona. So, too, can lead.

The years of preparation, of getting ready to commercially exploit Arizona mineral resources, are well toward their end. The figures of annual production of copper, gold and silver for the Territory can now be expected to increase rapidly

Portland M. Co., Central City, South Dakota; View Inside Mill. (See page 202.)

ing the last two years consists in the opening of great metal-bearing deposits and in their equipment with metallurgical plants. In nearly every county of the Territory new mines have been opened, developed and equipped without the aggregate of this work at-

Portland M. Co. Mill, Outside Solution Tanks: (See page 202.)

Portland M. Co. Cyanide Mill, Central City, South Dakota. (See page 202.)

posits part of the system developed even more extensively in northwestern Mexico. Copper is the principal metal. The original sulphide minerals have been largely oxidized and secondary deposition has concentrated the values in large, easily minable deposits. In this development of the oxide and carbonate ores, Arizona mines have had a considerable

tracting attention. In nearly every county in the Territory a large proportion of the old mines are being reopened. This is true not only of the old mines that were worked as free-milling gold and silver propositions down to the zone of copper-bearing sulphides and then abandoned, but is equally true of the great silver mines, which have had the

toward a very much higher level than they have ever reached before.

Another feature of Arizona's mineral resources that the last few years has made prominent is the increasing area of the Territory that is being found productive. From a few camps development has spread out till it includes nearly the entire Territory.

Three Counties of California.

Trinity county, and, it may be added, two other northwestern California counties, have during the last half dozen years or so provided a number of mining surprises. Iron mountain, in Shasta county, which had been so repeatedly a commercial failure that its title, the Lost Confidence mine, seemed to reverse the usual fortune of mining names by proving itself no misnomer, was the first surprise. Long before the coming of 17-cent copper it became a striking commercial success in so large a way, that its former failures in a small way ceased to condemn the country, and became looked on as the misfortune of the old miners, who, it has since been erroneously assumed, did not know how to mine, rather than that there was a deficiency of value in the mine. This has been followed, since the copper price climbed to 17 cents a pound, by the revival of Copper City, as it was once known, under new names, Bully Hill and later Delamar, and, by the discovery that in the immediate vicinity in Shasta county there were many other copper-bearing deposits of enormous extent that only required the same complete, persistent development to become commercially the equals of the two specially referred to.

Siskiyou county, which to the uninformed had joined the long procession of mining districts whose mining had only historical and not commercial interest, has, like Shasta county, contributed surprises. West of Gazelle, in hills that long since had been supposed only a cattle or sheep range, a district of large and rich copper and gold-bearing ledges has been discovered and developed well along toward the largely productive stage. Henley, an early day mining camp where the miners had nearly all turned farmers by reason of the placers being supposed worked out, provides a surprise in a quartz mine that within the last three years has yielded more than half a million dollars. The Siskiyou mountains, in a wild region that is so untrodden that it is the last natural wild game preserve in California, is now making its first surprise in the development of enormous copper-bearing deposits. This is likely not to be its last surprise. It is both possible and probable that the closer investigation it will now get will develop valuable mines of gold, quicksilver and platinum. There are many geological reasons for assuming the source of the latter metal found in the Klamath river gravels to be in the Siskiyou mountains north of that stream rather than in the region south of it.

Trinity county, of the three in the northwest, has been the most spectacular in its late mining surprise

offerings. Soon after the announcements of the Klondike discoveries in 1897, it came forward with a very large nugget of gold from a quartz lode. It has not since repeated this; but as a result of the confidence developed, there are now operating half a dozen profitable quartz mines in the Carrville country—the region of the great find. This year the first surprise is almost the last that could be anticipated—the discovery of a great placer deposit—the Sweepstake property, now receiving the largest and most costly installation of placer mining plant made for many years past in California. Another mining surprise of this year from Trinity county is in the late reports of discoveries from the New River country, in the northwest corner of the county. First it was of copper, and last of large quartz lodes of more than ordinary richness in gold. New River is not new as the scene of spectacular mining discoveries that inspire the efforts of prospectors. Twenty years ago nearly similar reports came from this distant, and quite inaccessible region, of gold-bearing ledges of extraordinary richness, but the interest in them rapidly died out till they were forgotten, to be recalled now that the same reports come out as new.

Shasta county and, to a lesser degree, Siskiyou county have presented their mining surprises as a result of changes in commercial conditions which have made known mineral resources for the first time available. Trinity county and, in the main, Siskiyou county are making their unexpected showing now simply because the early-day prospecting was incomplete. It has been taken for granted that the early-day miners and prospectors overlooked nothing. The fact is that there was comparatively little prospecting and exploration done in early days in much of this country, and what was done was extremely superficial. The region of many of the late surprising finds is remote and extremely difficult. The few inhabitants long since ceased to look for anything new in mines, and in time have come to believe there could be nothing new. New-comers for the last twenty years have been few and have quite generally retreated before the great difficulties attendant on original work, coupled with the prevalent belief that ultimate failure waited on the end of any effort to make discoveries.

Happily, the discoveries have come at a time to instill the confidence of reward before which physical difficulties vanish like a morning mist before the uprising of a California sun. There is no reason why the New River country, in Trinity county, and the Siskiyou mountains, in Siskiyou county, should not become rich and populous mining centers. Well-defined and well-proved mineral belts traverse both regions. The Hay Fork country in Trinity county, too, promises well. It must be remembered that what is found now, is only found now, because it was never thoroughly searched for in the old mining days. A prospector in these California localities is really in almost as completely untried ground as any region of Alaska or British Columbia, and in a country that has been less prospected over than Arizona or Nevada.

This journal has frequently called attention to the dormant mining possibilities of this section and suggested that it would reward the investigation of prospectors and operators. The magnitude of these possibilities is clearly shown in the last semi-annual report of the Mountain Copper Co., which shows that during the six months there were smelted 172,782 tons of ore, which yielded an average of ninety-four pounds of copper to the ton, netting an average profit of 6 cents a pound, or \$1,458,000 profit for six months. This rate of production puts it in output ahead of the Quincy mine, the second in production in the Lake Superior region.

THE figures given on another page in a paper by William H. Radford, showing cost details of a hydraulic mining exploitation in California, are interesting. The low figure of total cost, 2.198 cents per cubic yard for material moved, is, if not the lowest ever made, certainly close to it. It is particularly remarkable in connection with the low figure of duty to the inch of water, 1.91 cubic yards. With higher banks, ordinary duty for water on similar free wash gravel would be from 2.76 cubic yards to 3.2 cubic yards. While the figures are actual, and not estimates, they cannot be safely taken as a standard for estimating the costs

of other projected hydraulic mining. The costs of water supply and of breaking up rocks and clay in nearly all operations are higher than these figures.

Economies in Power Costs.

The conservation of the water power of the mountain streams in California and Colorado, and its electrical transmission to mines and milling plants and to industrial centers, has been notably extended and complete. Both States are now inaugurating the conservation of the fuel energy of coal in a convenient central station for distribution electrically to mines and mills exactly as if it was water power that was being so utilized. In the Colorado instance it is the already complete utilization of the available water power that, coupled with the economy that can be effected in saving transportation of coal from the coal fields to the more or less distant and inaccessible mining plants, is the business motive for the new enterprise. In the California instance it is more particularly the cost and difficulty involved in getting a proper water supply to the mining plants. They are in the Randsburg district in Kern county, in a nearly rainless region. In Colorado the metal mine owners are reported to be planning to buy a tract of coal-bearing land, and so conduct the business that they shall get power at flat cost. In California the owners of the coal mines are engaging in the business to make an additional profit from their coal mines. In both cases the profit gains are made by the elimination of a middleman, and a middle service—transportation.

These two widely separated effects from a similar cause—the existence of a large reducible transportation item of the costs of mining—are a practical commercial demonstration of the principle this journal suggested in its issue of June 1st of this year to the California petroleum producers, whose business it was claimed was being made unprofitable by high railroad freight charges. It was pointed out that what the consumers of fuel wanted was the light, heat or power, that was manufactured from the raw material—fuel. It was not essential that each consumer should manufacture light, heat or power for his own service. It was just as practicable, more convenient, and inevitably less costly to buy them ready made from the producer of the petroleum. It was suggested that it was cheaper to transport light, heat and power by wire than to transport petroleum by rail or by pipe line. Practical demonstration of the conclusive character of this suggestion has not only been made by the two commercial enterprises instanced above, but the limit of distance of electric power transmission has been raised, and its cost of transmission lowered since June of this year. The Bay Counties Power Co. are commercially utilizing power 220 miles from the generating station, and a practical commercial test has been made of transmission at 80,000 volts pressure as compared with 40,000 volts, then regarded as the extreme limit. This doubles the duty and earning power of the investment in copper wire used in transmission lines.

The feature in these practical developments that should fix the attention of petroleum producers, and coal producers as well, is the reduction of the reducible item—transportation—to its economic minimum, and its possible practical elimination as a cost item determining sale price. It must surely be realized that no combination of producers of raw material—of petroleum—is commercially invulnerable against new and cheaper fields of production. The opening of one petroleum well close to tide water at San Francisco bay will take away much of the present value of petroleum production elsewhere in California where that production must be transported to market as raw material. The difference of transportation cost will give the market to the nearest field. But, if the raw material is first manufactured into light, heat and power before going to market, there is then no determining difference arising from difference of transportation to give the market to the nearest field of production. The sole cost difference at the market is current interest only on the difference in the respective sums invested in transmission lines. This difference as compared with the sum of the costs, due to investments and charges that are the same in all the fields, is so small that it cannot determine control of the market.

Concentrates.

THERE is no market in San Francisco for tungsten ore.

FOUR-DECK CAGES, holding four mine cars, are used in many of the large mines at Butte, Mont.

ZINC AMALGAM is made by pouring mercury into melted zinc. It should be kept under water.

A TRIAL COURT in Baltimore, Md., has ruled that a seat in a stock exchange is not taxable though it is property.

THE cubic contents of an ore body in feet, divided by 11 if sulphides, and by 15 if oxidized, would give the tonnage, approximately.

FOR the weight per lineal foot of square and flat bars, multiply the area in square inches by $3\frac{1}{2}$ for cast iron, $3\frac{1}{2}$ for wrought iron and $3\frac{1}{2}$ for steel.

THE basis of the settlement of the machinists' strike in San Francisco is that they return to work per day of nine hours, with nine hours' pay therefor.

THE best pressed brick and firebrick weigh 150 pounds to the cubic foot, common hard brick 125 pounds to the cubic foot and soft brick 100 pounds to the cubic foot.

ANNUAL ASSESSMENT WORK questions are matters for determination by the courts, not by the Land Department at Washington. This is the latest ruling of the latter.

NICKEL, cobalt and manganese are magnetic but in a much less degree than iron. A number of minerals are also more or less magnetic in which the metal by itself is not magnetic.

FOR weight per lineal foot of round steel bars take the diameter in quarter inches, square it and divide by 6. Or take the diameter in eighth inches, square it and divide by 24.

ALL of the large ferry steamers on San Francisco bay, Cal., are changing from coal to petroleum fuel, permission having been granted by the U. S. Steamboat Inspection officials.

MAGNETIC SEPARATION, combined with jigging, has been found by experiment to concentrate chrome iron ores so as to bring them above the 50% limit which makes them marketable.

It is ordinarily found to be the case that a more rapid and cheaper construction of a tunnel or drift can be made in soft rock that requires timbering than in hard rock that holds up without it.

THE breaking lode of an aluminum wire, .126 inch in diameter, which has a tensile strength of 28,200 pounds to the square inch and an elastic limit of 19,376 pounds to the square inch, is 2790 pounds.

THE rehearing of the complaint of the Kern, Cal., petroleum producers against the railroad transportation has been postponed to December 21, 1901. Meanwhile the rate complained against remains in force.

THE New Zealand Minister of Mines states that his Government offers a bonus of £2000 for the introduction of a machine or appliance which will satisfactorily treat auriferous blacksand deposits on a large scale.

THE combined by-products of coke making have, in their primary state, a value of about \$1 for every ton of coal coked. Ultimately converted by chemical processes, these products have a very much greater value.

THERE is no fixed limit yet determined as the maximum pressure head that it is practicable to use with a tangential water wheel. An installation with 1700 feet head has been made and one of 1900 feet is under serious consideration.

THE copper produced by the Utah Con. Co at Bingham is claimed to cost 3 cents a pound, after crediting the gold and silver produced with it against the costs. Without this credit it is claimed the copper costs 7 cents a pound to produce.

NAPIER'S law of the flow of steam through an orifice from a higher to a lower pressure is proportional to the absolute steam pressure until the pressure against which the flow takes place equals or exceeds .6 of that in the vessel under pressure.

THE effect of the association of magnetite and chalcopryrite in ore bodies requires exploration in depth to determine questions of magnitude and permanence. No such deposits have yet been mined more than superficially on the Pacific coast.

THE cost of smelting copper ores to matte at the Granby smelter at Phoenix, B. C., according to the statement of the president of the company, has been reduced to \$1.90 a ton and it is anticipated that the cost can still further be reduced.

A FLUME 6 feet wide and 5 feet high should be built of 1½-inch plank and 4x6 scantlings, 6x8 or 6x10 lumber for sills. A 16-foot box of such a flume would require to construct it between 760 and 800 feet of lumber, being 47½ to 50 feet to the lineal foot of flume.

ARAGONITE is calcium carbonate distinguished from the exceedingly common form known as calcite by its higher specific gravity and absence of rhombohedral cleavage. It is a deposit from some mineral springs, and in limestone caves form stalactites.

THE copper ore mined and reduced at Ducktown, Tenn., is claimed to average forty-five pounds of copper to the ton. It is stated that at the present price of cop-

per a production of twenty-five pounds to the ton of ore covers all the expenses of production. This would be about \$4.10 to the ton as costs of mining, roasting, smelting and converting.

THE amount of water required for a gold stamp mill varies from five to fifteen tons per ton of ore crushed, according to the character of the ore, style of mortar and concentration used, etc. The boiler would need about 7½ gallons per horse-power hour.

THE locator of a mining claim located any time this year has until Dec. 31, 1902, to do the \$100 worth of assessment work required to hold it. On unpatented mining claims located prior to Jan. 1, 1901, there remain but forty-five days in which the requisite work must be done.

AT Atlin, B. C., placer miners taking out coarse gold that was bright and angular traced it to its source in a quartz lode by deep trenching, cutting down through the more or less disintegrated surface of the bedrock into rock in place. The lode is now being mined and milled with profit.

WHERE an individual or company takes possession of a claim, holds it and works for five years, as good a title is thus obtained as though a formal location of the property had been made. The Supreme Court of California so decided in the case of the Altona Q. M. Co. vs. the Integral Q. M. Co.

PROVED oil-bearing land at Beaumont, Texas, is held at \$100,000 an acre. There are 200 acres of proved land in Spindletop hill, making the market valuation of the Beaumont field \$20,000,000. It is reported that a prospective buyer was asked \$4000 for a 20x50-foot lot, or at the rate of \$175,000 an acre.

HYDROGEN PEROXIDE is the antidote for cyanide poisoning. A 2.5% solution is used in hypodermic injections made in different parts of the body every four minutes. At the same time the stomach is washed with a 2% solution of the peroxide, which forms with hydrocyanic acid the oxamide $2CO NH_2$, which is harmless.

A MINING CLAIM located on Jan. 1, 1901, does not require assessment work in the year 1901. Assessment work must be done in 1902. The claim, unless assessment work is done in 1902, becomes forfeit and is locatable again on Jan. 1, 1903, but not before then. Assessment work done in 1901 does not save doing it in 1902. It must be done in 1902 for that year.

IN the Rand mines, Transvaal, owing to the scarcity of labor, it has been found economical to use machine drills to break the ore in stopes and to afterwards sort out the barren waste broken out with it. This waste has amounted to as much as 40% in some of the mines. It is considered cheaper to sort the waste out by hand than to put it through the mills.

A SUSPENDED CABLE ore transportation line will operate automatically with a net fall of 400 feet to the mile in the line. With less fall, auxiliary power must be employed to operate the line. With more fall, power for other purposes can be had. Provision to utilize this developed power depends on the commercial feature—there must be enough extra power to pay.

COMPRESSED AIR wasted from power drills is so contaminated with oil from the cylinder that it cannot be taken into consideration as ventilation. It is as important to displace it with pure air as it is to drive out or draw off other vitiated air. The ventilation should be an independent supply provided by fan or blower, delivering by pipe at the point where miners are working.

THE Cripple Creek, Colo., drain tunnel, now in 2800 feet, 9x9 feet in dimensions, is costing somewhat less than \$30 a foot. The Baker Divide tunnel, near Forest Hill, Cal., 3300 feet long, 10 feet wide by 8 feet high, cost \$14 per foot. The Red Point drift mine tunnel, at Damascus, Cal., 2400 feet long, 8 feet wide by 7 feet high, cost \$19 a foot. The Gray Eagle tunnel, near Auburn, Cal., 2700 feet long, 9 feet wide by 7 feet high, cost \$11.50 a foot.

THE U. S. Revised Statutes provides a method by which a U. S. patent can be obtained to the small fractions of public land left between mining claims, provided the fractions are not mineral, do not contain lodes or placers. The General Land Office will order the sale of these lands at public auction on request being made to it, accompanied with a deposit of the minimum amount that would be payment for the land at the minimum price of \$1.25 an acre.

FOR a stamp mill, free-milling treatment, 70 feet elevation between the concentrator and mine-car dump floors provides sufficient fall for the movement of the ore through the several appliances to be effected by gravity. As low a difference as 40 feet can be made to answer every purpose. In some cyanide and concentration mills the difference in level runs up to 200 feet. At the Golden Gate mine cyanide works at Mercur, Utah, the difference in elevation is 145 feet.

WORK to the amount of \$100 performed in placer mining on a lode claim by a lessor is annual assessment work on the claim. But the reverse case would seem different. Work to the extent of \$100 in amount done on a lode inside the boundaries of a placer claim, it would seem, could not be considered assessment work on the placer. The lode within the placer, provided it is known at the date of the placer location, is not held by virtue of that location, but must be separately located as a lode. The work without location, according to law, would not protect the lode against location by a second party. If

the lode is located in a lode claim, the work done on it applies to the lode claim alone as assessment work. The placer claim must have work done on it to the extent of \$100. The difference would seem to be in the difference of the grant made by the law. In a lode claim all the mining deposits, without reservation, within the exterior boundaries, are granted by the law. In a placer location only the placer deposit is granted, known lodes are reserved.

TO GET a power development from a water flow in a pipe, a large part of the full capacity of the pipe to conduct water is lost. The supply pipe water velocity should preferably be kept low, so that the jet flow used gets the velocity of the largest possible portion of the total head. If the pipe is delivering its full flow—all it can carry—there is no power development possible; all of the power in the head is used to move the water against the pipe friction.

NEARNESS to a proved mine is not a guarantee of the value of a prospect. The mere presence of similar ledge matter in the known mine and the prospect, does not create a presumption of the existence of the same ore values. While there is reason to anticipate that knowledge of the laws of formation of ore bodies will ultimately become so perfect that it can be used to locate ore bodies in advance of their development by mining with some considerable degree of accuracy, no such knowledge is yet in existence.

IN the suit of the Central Eureka M. Co. vs. the East Central Eureka M. Co. at Jackson, Cal., the court decided in favor of plaintiff and confirmed plaintiff's possession, stating that the law is well settled that a patent for a mining claim relates back to the location and is a consummation of the purchase then made. The patent being but confirmatory of the title by location, the patentee obtains the same right under it that he would have obtained if the patent had issued immediately after the location in compliance with the terms of the statute.

A BLANKET LEDGE or vein is, as used in California, a vein or ledge lying somewhere near a true level. The term is, however, used more to express a comparison with the ordinary ledges which have a dip or pitch rather than to describe a class of ledges. The apex line of a blanket ledge is the line of its highest edge. A location on that edge would give the location extralateral rights to follow the dip, be it ever so slight. If perfectly flat, the line of outcrop cut would be the apex line, and location on it would take extralateral rights in the opposite direction.

THE General Land Office at Washington has ruled in a recent case coming before it that the entry of a mineral application for United States patent must be made within the calendar year next succeeding the calendar year in which the period of sixty days' publication of the notice of application was completed. This ruling takes the place of the rule that entry must be made within a reasonable time after the publication is complete. The old rule enabled a claimant to complete his application several years after publication, but has developed abuses that the new rule, substituting a definite limit, will do away with.

THE loss of gold in the final tailings from a free-milling plant, with concentrating tables and either cyanide or chlorination treatment, is not a fixed value. It varies with different ores and with different localities and cost of facilities. The effort to recover values stops short in every case at the point where the recovered value becomes equal to the cost of getting it. There are instances where it is less than 20 cents a ton, and claims have been made as low as 8 cents a ton, and again losses are recorded as unavoidable that are as high as \$1.50 a ton. Anything over 50 cents a ton should be made the subject of a thorough questioning analysis before it is accepted as the acme of good milling practice.

QUARTZ BOULDERS and pebbles found in placer gravels are frequently remarked on as carrying no quartz gold. The condition is not universal, for placers are known in which the quartz boulders and pebbles do contain gold. The barren character of such float quartz is far the more common, however, and has been the foundation of many theories of formation of the gold found in the placers which excluded the idea of its coming originally from the quartz. The explanation of the seeming contradiction is simple. The gold in quartz is originally associated with pyrite and other sulphides. Surface percolating waters oxidize these sulphides and largely remove them, before the quartz, still containing the gold, by erosion of its overburden is itself in turn eroded and becomes placer. The quartz breaks up on its lines of least resistance, which are the lines where sulphides have been removed. The larger part of its original gold content is thus freed and the separated quartz fragments are barren. In addition to the structural weakness of the quartz containing gold, its higher specific gravity constantly increasing as the fragment becomes smaller by abrasion, by retarding its down-stream movement relative to quartz containing no gold, keeps it for a longer period of time under abrading influences. There are as well many quartz ledges that are barren of gold, and those ledges that do contain gold have barren portions. Such barren quartz, called "bull quartz" by the miners, is more resistant to disintegration than the gold-bearing quartz. It may thus happen that the quartz found in the gravels with the gold is not the quartz from which the gold was derived.

A Direct Wet Crushing Cyanide Mill of the Black Hills.*

Written for the MINING AND SCIENTIFIC PRESS by
EVERETT B. SAWYER.

In August, 1900, the Portland Mining Co., under the management of N. W. Chapman, obtained control of a nearly new, first-class 20-stamp mill at Central City, S. D. A "cyanide annex" was started so as to use the stamps for crushing in cyanide solution.

In September I accepted the position as chemist in charge of the mill and finished the construction. We started up in November, built an addition early last spring, and have operated the mill for the past year under the above management. I will try and give the general practice of the mill as we worked it out; the method being comparatively new in this section of the country.

The ore is brought by rail from their mines, in the Portland district, some 5 miles from the mill, and about 6 miles up from Deadwood. The ore is, for the most part, from flat formations. It is of a hard close-grained siliceous character and of several different varieties, all coming under the head of siliceous refractory ores. It varies from a comparatively hard, oxidized surface ore that is very good cyaniding ore, to a harder unoxidized blue ore, carrying some arsenic and arseno-pyrites, and not adapted to direct cyaniding. There are also several grades of brownish oxidized ores, well adapted to cyaniding after fine crushing. It is the aim to treat these oxidized ores, though some of the unoxidized gets mixed in, so that the mill tailings vary according to the amount of this blue ore present, other conditions being normal. All the ore carries considerable silver, some in the form of chloride, that extracts very readily.

In the mill work advantage was taken of the results obtained in the Dakota Co.'s experimental wet crushing plant, operated by John Henton, and published in this paper March, 1900. But in starting a plant of this type separating and treating slimes and sands, we found some new difficulties to overcome, and as my experience had been confined to dry crushing plants we had to "cut and try" on some points. After running through the winter with one shift per day the capacity was increased and a new boiler installed so that for the last two months we have been running twenty-four hours per day. The results are as satisfactory as have ever been obtained on this ore. The extraction is nearly 10% better crushing to 20-mesh, as compared with 10-mesh, as we started on. Finer crushing will increase the extraction even more.

In many ways the theory of cyaniding by crushing with stamps in a weak solution is ideal, as you get the air agitation and action of the cyanide in the mortars, even before the ore is crushed. With the use of lime in the batteries, no more cyanide is consumed than with a dry-crushing treatment, the consumption being seven-tenths of a pound per ton of ore, but the loss is close to one pound, as some cyanide goes to waste with the slimes moisture.

Slimes separation and direct treatment have in the past been somewhat of a difficulty, but they are now handled satisfactory in several ways in different mining countries. Devices used in sizing ores in concentration mills are being adapted to cyanide mills with good results.

The Portland mill receives the ore by rail, in bins above, thence it is run by car onto a short grizzly to a 10x20 crusher set at 2 inches. In six to eight hours one man can run and feed through enough ore to keep the mill supplied for twenty-four hours. I substituted compound cups in place of oiling by hand, so the crusher takes the minimum attention, and could supply ten or fifteen more stamps.

The crusher bins feed into four automatic battery feeders. The ore is stamped through 20-mesh screens by twenty 900-pound stamps, dropping 8 inches ninety-four times a minute. The stamps have a duty of about two and four-tenths tons on this hard ore. A weak cyanide solution of from one to one and eight-tenths pound per ton is used instead of water for crushing.

The battery product has 41% passing a 150-mesh screen. I will give the entire sizing test later.

The sands, slimes and solutions run from the battery to a spiral sand pump, which elevates it to one of the slime sand separators over each of the sand-leaching tanks. There are four of these leaching tanks 6 feet deep and 16 feet diameter.

We had some trouble with slime separation at first, and then, owing to a lack of elevation for a proper distributing arrangement, we put in a simple gravity settler box gotten out by B. C. Cook, and it is doing the work very well for our ore in small tanks. For large tanks or finer crushings, I will mention two other better ways before concluding this.

From these first slime tanks the excess of solution is drawn off clear by means of a floating hose, and is pumped to the battery tank for the crushing solution again. These slime tanks are only 8x10 feet, and too small for good settlers, but by placing a partition on one side of the tank, same as in a precipitation box, the slimes go down and settle nicely until

the tank is nearly full. It is necessary to switch the slimy solution back and forth so as to draw off the excess of solution clear. When one of the tanks gets pretty well filled up and the excess solution is drawn off, the slimes are discharged through a bottom trap-door into a lower slime tank, where the actual slime treatment begins, but at this stage 60% of the slime value has already been extracted by the weak crushing solution.

The box now in use, shown in cut, is about 3x4x5 feet. "I," the inlet, is a 3½-inch pipe from spiral pump. "O," the outlet, is a square covered launder, 12 inches wide and 5 inches high. "D," the bottom discharge door, is operated by a long handle. As the battery product comes in "I," the sands settle, while the solution and slimes flow out, "O." When the box fills with sand to "O" it is dumped through "D." The solution on top helps to spread the sand in the tank. This leaves a thin layer of slime on the sand after each dump, and more slime around the edges of the tank than in the center. This is taken care of by carefully raking over the slimes after the solution drains through just before time for the next dump.

All the slimes, outlet "O," go to a center common launder, on the end of which is a long 8-inch galvanized pipe tee, each end of which goes over a slime tank, and as the tee swings on the end of the launder the slimes can be run to either tank by raising or lowering one side of the tee.

The slimes treatment consists principally in washing out the values already in solution, during which time the rest of the cyaniding valves are extracted by pump agitation. We have three slime tanks 8 feet deep by 16 feet diameter, with false bottoms in them sloping toward two center discharge holes. These three tanks are in a row and have one common discharge pipe to waste or to a spiral pump, which is used as the agitator. The simple agitation by pumping from one tank to another, using an excess of barren solution and decanting, is the system used.

I have the tanks fitted and piped so that solution, water or steam can be put in from top to bottom. After agitation, filling up with solution and settling, the clear is decanted off by means of 2½-inch pipe working on a loose elbow at the center of the tank, and having a large square float at surface. This works very well, and is far ahead of the rubber floating hose: but probably the best arrangement in large tanks is the big funnel float as used in the Denver water works, that takes nothing but the uppermost thin sheet, and with a minimum disturbance.

In treating slimes we really reverse the leaching process by putting in barren solution at the bottom, settle and draw off at the top. We tried putting the solution on at the bottom, several different ways, but a central vertical pipe with arms on a swivel coupling about 2 feet from the bottom, proved the best, as the centrifugal force distributed the solution throughout the tank. But the principal agitation is from pumping the entire contents from one tank to the next. These tanks give us about four and one-half days treatment, but it is not sufficient time to make a complete saving. Nevertheless, the extraction obtained is close to 90%, while the saving is generally greater than 80%, which is better than that obtained on the sands. Before going to waste the slimes have several water washes, and then are decanted down to about 40% moisture, carrying 40 to 60 cents per ton in gold and from one-quarter to one-half pound of cyanide that goes to waste with the slimes.

Now returning to the sands. When leaching tank is filled up by the separator dumps the pipe from the battery product pump is switched to the separator over another tank. The excess solution is drained through the false bottom of the sand tank, thence going to the gold tank. The drain valves are closed and the tank is charged from the bottom with a three-pound solution—stands six hours, then after draining the crushing solution, carrying several dollars per ton, is circulated for three days. This is drained, the tank recharged and circulated with weak, barren solution before the wash waters are added.

The four tanks give us four and one-half days leaching. Small tests I made showed better results could be obtained by better leaching, or the time could be cut down by the pneumatic cyanide process. As it is, the extraction approaches 80%, and occasionally exceeds it, in gold. The silver extraction varies from 55% to 80%, according to the character of the ore.

A 45-ton sand tank is sluiced out an 8-inch pipe in from sixty to seventy-five minutes.

The crushing solution is supplied from solutions decanted from the slimes, and the solution is being continually used as a leaching solution and also run through a gravel filter to remove suspended matter, direct to gold tank and thence to zinc boxes. We have neat, handy zinc boxes, being made of standard 52-gallon barrels. We use two rows of six barrels,

each row with a double header. The barrels have the false bottoms and partitions, so as to bring solution up from the bottom. They make an excellent precipitation box, but before clean-up time they get so much gold in the bottom that the partitions overflow some. I have devised another arrangement with pipes to overcome this, and have a special series to be adapted to strong and another to weak solution and will explain them in detail in a future article.

In wet crushing the amount of solution constantly handled is in excess of dry crushing, and in a small mill, where the crushing, leaching and gold solutions vary but little, it is hard to keep value of gold solution up high enough to get the best product to clean up. The solution, before precipitation, runs about \$6 gold and one ounce of silver per ton; after precipitation 4 to 8 cents in gold and three ounces silver. It is possible the precipitation is aided by the silver making a "couple," as precipitation with gold and silver is in general better than with gold alone.

At first the "product" was shipped. Smelter returns were not satisfactory, so I started refining after designing and putting in a combination roasting and smelting furnace, now used by the Denver Fire Clay Co. with their furnace blue prints. I roasted the fine product direct and acid treated the rest. Acid treatment was carried out in a lead-lined tank; then, having no filter press, the slimes were washed and siphoned several times and dried by the furnace in two muffles 2x3 feet, then melted down with a 40% flux charge in No. 100 crucibles. My "maiden bar" of nearly 1000 ounces of bullion ran 970 fine, 705 fine being silver.

SIZING TESTS ON BATTERY PRODUCT.—With every ton of ore crushed there are five tons of weak cyanide solution that goes through the battery screen with this pulp. Crushed ore direct from the battery, using 10 and 20-mesh standard wire screens, gives:

| | 10-mesh screen. | 20-mesh screen. |
|---------------------------------------------|-----------------|-----------------|
| Pulp retained on 20-mesh..... | 9.00 | 0.4 |
| Pulp pass 20 and retained on 30-mesh..... | 17.00 | 6.0 |
| Pulp pass 30 and retained on 40-mesh..... | 8.25 | 7.2 |
| Pulp pass 40 and retained on 60-mesh..... | 15.75 | 17.2 |
| Pulp pass 60 and retained on 80-mesh..... | 9.00 | 10.4 |
| Pulp pass 80 and retained on 100-mesh..... | 1.75 | 7.6 |

| Pulp passing 150-mesh..... | 28.25 | 40.8 |
| Totals..... | 100.00 | 99.6 |

SANDS AFTER SEPARATION.

| | 10-mesh screen. | 20-mesh screen. |
|----------------------------------------------|-----------------|-----------------|
| Sands retained on 20-mesh..... | 21.0 | 1.00 |
| Sands pass 20 and retained on 40-mesh..... | 27.0 | 15.50 |
| Sands pass 40 and retained on 60-mesh..... | 20.0 | 18.75 |
| Sands pass 60 and retained on 80-mesh..... | 10.0 | 16.50 |
| Sands pass 80 and retained on 100-mesh..... | 1.5 | 7.75 |
| Sands pass 100 and retained on 150-mesh..... | 9.0 | 23.00 |
| Sands passing 150-mesh..... | 11.5 | 16.75 |

SLIMES AFTER SEPARATION.

| | 10-mesh screen. | 20-mesh screen. |
|-----------------------------------------------|-----------------|-----------------|
| Slimes retained on 40-mesh..... | 2.0 | 1.0 |
| Slimes pass 40 and retained on 60-mesh..... | 3.5 | 4.0 |
| Slimes pass 60 and retained on 80-mesh..... | 3.0 | |
| Slimes pass 80 and retained on 100-mesh..... | 2.5 | 1.0 |
| Slimes pass 100 and retained on 150-mesh..... | 14.0 | 4.0 |
| Slimes passing 150-mesh..... | 75.0 | 90.0 |

From these figures, by using a 20-mesh, you will see that the separation is not very close, but the sands leach very well with a 17% slime (that passing 150-mesh). But the slimes contain 10% that are coarser than 150-mesh. For best results this 10% should go into the sands, while a greater part of the slimes in the sands should be separated out.

A good separation can be made by a hydraulic cone separator, using weak solution instead of water. The sands from the cone sizer could be run through a distributor over the leaching tank, using more weak solution to aid in distribution. With ample-sized settling tanks the weak solution could be recovered again as fast as it was used, and make the process continuous.

It is merely the question of proper arrangement, giving elevation and with tanks large enough to do the work, using no slime tanks less than 16 feet diameter. In using the cone separators Mr. Merrill, superintendent of the Homestake cyanide mills, has an improvement in the shape of a small cone under the large one, and so slotted as to bring up the water uniformly, without currents. It makes a good separation on very fine tailings. Cone sizing requires a steady stream of wet-crushed ore. The spiral sand pump gives an intermittent stream, so it would require a small intermediate tank with outlet large enough to give a steady stream.

As I stated above, many devices used in wet crushing concentrating mills are being adapted to wet-crushing cyanide mills and tailings plants. While in Denver a short time ago, F. W. Hopkins of the Colorado Iron Works showed me a new screening device for either wet or dry sizing. It is a flat screen set at any pitch and operated by a multiple cam at each corner, which gives it an upward knock of several hundred per minute. The screen is brought back to place by springs. It has been tested, screening the

* See illustrations front page.

finer out to any mesh, including 120-mesh. It occurred to us that it could be used in cyanide mills of the above type very nicely. The screen could be set over the slime tanks and the separated sands could then be washed with weak solutions to an automatic distributor over the leaching tank, and thus get a perfect separation and distribution in cyanide solution. It can be adapted in several different ways, as circumstances demand. The screen is certainly a big advance in separating the fines in any kind of ore, wet or dry.

With the separating devices and various means of slimes treatment that are available to-day, direct crushing by stamps with weak cyanide solution can be made to give the best and most economical results on certain classes of hard, close-grained ore, thus making it possible to change many discarded stamp mills into modern cyanide mills.

The relative merits of wet and dry-crushing cyanide mills will be given a very good test this winter, as there is a new wet-crushing cyanide mill, similar to the Portland, and a dry-crushing mill that will be run on the same general class of ore in Deadwood, and may be the means of some valuable and interesting data.

The Portland mill has shown some advantages over dry crushing by rolls, and I believe we will hear more of direct wet-crushing cyanide mills in the future than we have in the past.

Deadwood, S. D., Oct. 17.

The Wealth of the World.

The wealth of the world is created, not by labor, as political economists and all superficial thinkers have falsely taught, but by ideas that save labor—that multiply the laborer's capacity. That all wealth is the creation of labor is a fundamental fallacy which can only retain the semblance of truth to such as are incapable or indisposed to think to the bottom of things. Labor unassociated with labor-saving ideas has never anywhere in the history of mankind been able to produce as much as was necessary for its own sustenance, but has had to draw on the bounties of nature for the balance. The man with the hoe is a man working in association with an idea that largely increases his capacity—an idea involving the application of the principle of the lever, which enables him to do more than ten men could do with their hands. The hoe, insignificant as it is relatively to-day, was an invention of revolutionary importance to mankind. It enabled man for the first time to create a surplus—which is wealth. The wealth created leisure, and leisure engendered ideas of comfort and stimulated progressive invention. Labor-saving inventions are the yeast of civilization. All labor-saving inventions are only contrivances to save wasted force. Most of the natural force of the world is still wasted for the want of inventions to utilize it. It would probably be a generous concession to man's pride in his ingenuity to admit that so much as 2% of the visible and calculable force of nature has yet been harnessed into his service—we are still so far as that from the climax of civilization.—Joseph H. Hutchinson.

PLUMB LINES 4250 feet long were lately swung in Shaft No. 5 of the Tamarack copper mine in the Lake Superior copper regions. It was decided to cross-cut at the 29th level, at a point 4250 feet below the surface, and two plumb lines were dropped to give the direction. No. 24 piano wire was used, and this wire was lowered from drums attached to a small two-cylinder hoisting engine placed at the mouth of the shaft. To carry the wires down and prevent entanglement in the timbers two "balloons" were used. These were made of wood, were 10 feet long, 2½ feet diameter at the center and tapered to a point at both ends, and weighed twenty pounds each. A lantern was swung in the center of each balloon. The lines were dropped to the bottom in thirty minutes, and 8-pound plumb bobs were substituted for the wooden ones until the wires were adjusted for distance. The 50-pound bobs were attached and the wires stretched 15 feet, requiring that much to be cut off of each. When all was ready the bobs were immersed in two pails of engine oil, to check vibrations; but here something unlooked for occurred, as the wires shortened up 25 inches because of the buoyancy of the oil. A similar set of plumb lines was swung in Shaft No. 2, 3220 feet distant from No. 5, at the surface. In both cases a divergence of about ¼ foot was noted in the distance of the wires from each other; at the top of the shaft the distance was 12.6 feet, and it was 12.7 feet at a point 4250 feet down. Lead bobs were tried instead of the iron ones, but without changing the result. No explanation is given for the disturbing force in the account so far published.

The Aspen tunnel, on the Union Pacific Railway in Wyoming, opened to traffic in October, is 5900 feet long and pierces the Aspen range, one of the eastern foothills of the Wasatch mountains. Its construction was attended with great difficulties, owing to the presence of a large volume of water met at different points in its length, gas and crumbling shale. In some places the material swelled like a sponge, crushing all timbering and necessitating the use of iron and steel to brace the heaviest timbers obtainable. Work was commenced on the tunnel ten years ago.

Some Pumping Data.*

By T. L. WILKINSON.

The largest Cornish pumping plant in the world is the huge Chapin pump of the Chapin Mining Co. at Iron Mountain, Mich. The pump is designed to pump 3000 gallons per minute from a depth of 1500 feet. Some idea of the enormous proportions of this pump may be found from its dimensions. The engine is of the vertical type and compound, and stands 54 feet from the floor. The high pressure cylinder is 50 inches and the low pressure cylinder is 100 inches in diameter, and the stroke is 10 feet. The flywheel is 40 feet in diameter and alone weighs 164 tons, without doubt the heaviest flywheel ever built. The total weight of the engine, exclusive of pumps and shaft work, is 600 tons.

The pump end is attached directly to the beam end which overhangs the shaft. The pumps are of single-acting Cornish type, with plungers 28 inches in diameter and 10-foot stroke. The number of strokes varies from four to ten. The pumps are arranged in series, each set having a lift of about 200 feet. This plant was designed and built by the E. P. Allis Co. of Milwaukee.

Perhaps the largest pumping engine in the western part of the United States is the large Cornish pumping engine at the Ontario mine at Park City, Utah. I quote largely from the article of W. P. Hardesty on this subject.

As the various shafts and levels have been extended the amount of water to be handled has steadily increased. Up to the time that the drainage tunnel was constructed from No. 3 shaft, at the 600-foot level, all the water—amounting to about 4500 gallons per minute—was pumped and discharged through a short tunnel about 500 feet from the surface. This first drainage tunnel from No. 3 shaft carried off all the water of the mine as low as the 600-foot level.

Below this level, however, all the water had to be pumped, and it was decided to erect a large Cornish pump. The large pump, which was installed at the mouth of shaft No. 3, was from the design of W. R. Eckhart of San Francisco.

"The two large cylinders are nearly vertical, being at the same height and inclined toward each other at the top. The high pressure cylinder is 38½ inches in diameter, and the low pressure 70 inches, and the stroke of each 10 feet. The cylinders are both steam-jacketed, and have cut-off valves, though the steam is usually controlled by the throttle valve. The piston rods are connected to the opposite ends of a walking beam or 'bob,' while the connecting rod to the crank which turns the flywheel is attached to a pin at the top of the bob. This connecting rod is 28 feet long, while the arms are 14 feet 6 inches. The flywheel is 30 feet in diameter and weighs fifty tons, its shaft being 22 inches at the flywheel, 16 inches at the outboard and 20 inches at the crank rod journal. The engine's speed is five to seven revolutions per minute, and it works with a steam pressure of 100 pounds. The engine uses a jet condenser. The connecting rod to the pump rod is attached to the bob at the same end as the connecting rod of the high pressure cylinder, but lower down, the distance from center of pins being 4 feet 2 inches, with 14-inch diameter journals, the journals for pins for the engine connections being 10½ inches in diameter. The total weight of the bob is seventy-five tons. The foundations of the engine are 54 feet below the surface, the cut stone necessary being carried up. Over 7000 tons of quarried work were required in the foundations. The pump shaft is 7x9 feet, with enlargements at pump and bob stations, and is heavily timbered.

"The pumps are located at the 1000-foot and 800-foot levels, water being pumped up to the 600-foot level. The pump rod is made of 16-inch square Oregon pine, in 60 to 80-foot lengths, the joints being made by four straps of iron 1x12 inches by 30 feet, thus giving a lap of 15 feet. The two pump columns are 18 inches in diameter and are riveted wrought iron.

"At the 300-foot, 500-foot and 700-foot levels are placed balance bobs connected with the pump rod, the design being to give the engine the same amount of work on the up and down strokes.

"These balance bobs each have counterweights of twenty-nine tons. The two pumps at the 1000-foot level have 20-inch plungers, with 10-foot stroke. The sump is 45 feet deep, but is nearly always full, the suction never exceeding 10 feet. Between 300 and 350 gallons are pumped at each stroke, the water discharging from the lower pumps into a tank located upon the 800-foot level, where two pumps similar to those at the bottom are put in. The capacity is about 2500 gallons per minute. The engine and pumps cost at the factory \$110,000, while the total cost, including foundations, erection, buildings, pump, shaft equipment, etc., was about \$250,000. Besides the Cornish pump, there are four steam pumps underground to relieve it in emergencies, and to act as auxiliaries during the largest flows of water. There is one each at the 1000-foot and 800-foot levels of shaft No. 3. These are 23-inch and 42-inch Knowles compound pumping engines, and have a capacity of

1600 gallons per minute raised 200 feet, the raise being divided into 200-foot lifts by the 800-foot level. There are two additional columns of 15 inches diameter each in the pump shaft for these pumps. Steam is supplied to the pumps in No. 3 shaft by a 6-inch pipe, jacketed with 1½ inches of asbestos, and about 1000 feet long in all. The work done by the Cornish pump has been a great saving over the direct-acting pumps underground. Coal is hauled from the mines at Coalville, 22 miles distant, on the Union Pacific Railway, and costs \$4 to \$4.50 delivered at the mines."

In 1888, at the Ontario mine, a tunnel was begun at the foot of shaft No. 2, at the 1500-foot level. It required six years of the most difficult kind of work, with many mishaps from excessive flows of water, to complete this work. The tunnel was entirely through rock—no earth at all. The tunnel is about 3 miles long and cost in the neighborhood of \$500,000, complete.

The large amount and continuous flow of water through this tunnel led to the idea of using this otherwise wasted energy. A plant was determined upon to utilize this water to light the mine and furnish power for the shops of the mine.

The plant is driven by a 3-foot water wheel, which is estimated to deliver to the main belt 80 H. P. at 280 revolutions under an effective head of 120 feet. The dynamo is an eight-pole 60 K. W. monocyole alternator, driven at 900 revolutions by a 12-inch belt from the pulley on the wheel shaft. The length of the line of transmission is 6½ miles over a rough and broken country, 9000 feet above the sea level. The loss in transmission at full load is estimated to be 11%. This plant supplies light to 700 lamps of 16 C. P. at 110 volts, also drives three motors, two of 15 H. P. and one of 25 H. P.

"Two engineers are employed to run the Ontario electric system, each of whom runs the plant twelve hours daily. No labor is involved, owing to the steadiness of the load both day and night, the attention required in the power house being limited to the inspection of oil in the various bearings and the starting and stopping of the plant at the beginning and end of each run, at which time the machinery is wiped off. The entire system at any instant involves only the attendance of the engineer at the power house, who also makes any slight repairs or alterations required from time to time throughout the distribution. The operating expenses, therefore, include only the engineer's pay, occasional repairs and lamp renewals."

It is estimated that the saving in oil and fuel by the use of this plant is \$3000 per year.

The drain tunnel is being extended so as to drain the Daly mine also. This will give additional power and the present plant has probably been enlarged, as was contemplated. In this way Park City may be lighted and also power supplied to various industries, thereby making the plant pay dividends.

The great Cornish engine is retained to put into service when the time comes to go below the 1500-foot level. The steam pumps which were used underground have been taken out, chiefly on account of excessive cost of operation and partly on the supposition that the Cornish pump will be able to handle the water until a very much greater depth than 1500 feet has been reached, as the drainage tunnel takes care of all the water above the 1500-foot level. The Cornish pump would pump and discharge all water below the 1500-foot level into the drainage tunnel, thus increasing the power of the electric plant.

H. C. HOOVER, M. E., who has spent several years in China, says of gold mining there that, "theoretically, the precious metals are the property of the Emperor, and private individuals are not allowed to mine; but, practically, the Chinese mine everything that contains a color of metal as far as their appliances permit. The Chinese have, according to their histories, mined gold in these regions for more than 1000 years. The striking feature about Chinese mining is that a Chinese farmer, working in the winter time, when otherwise he would be idle, will keep going if he can get 2 cents a day. And he will work down to water level gold quartz veins 5 inches wide worth but \$3 a ton. If we would take any given region in California and work all the veins of that size, we would have the country simply dotted with mining dumps, and in any given region the percentage of gold-bearing veins over 5 inches wide which would pay by modern methods would probably not be 1 in 1000. Then, if we consider that all such workings are covered in, we have the condition of things in North China. For the engineer or prospector to know anything of the value of that country is impossible unless a shaft be sunk and a pump erected on each ancient working. With a proportion of 1 success in 1000 of such expensive operations, it is evident that there is a peculiar bar to the development of China's precious metals."

WIRE-WOUND cast iron water pipe consists of steel wire being bedded in grooves cast in the body of the pipe, and the ends secured by pouring molten tin over them. The whole is then given an asphaltum coating. Trials with pipes thus fortified are said to have given excellent results, and a large water main on this principle is stated to have been put down in Paris.

*Proceedings of Colorado Scientific Society.

Late Gold Dredging Practice.*

NUMBER III.

Written for the MINING AND SCIENTIFIC PRESS
by RALPH L. MONTAGU.

The modified type of dredger is herewith illustrated (Fig. 2).

Where the gravel is not too coarse, the capacities of both these dredgers can be increased about 60% by replacing the links that connect the buckets

It is not advisable to let large boulders (above 200 pounds) dump and go through the grizzly; these are taken out of the buckets as they come up and are rolled overboard.

It takes very little more power to drive a close-connected chain than an open chain; the weight of the extra buckets and the gravel in them is the only factor to be considered; the load on the engine or electric motor is much steadier than it is with the open type.

built by the Risdon Iron Works, have a chain of alternate buckets and links, which differ from those of the Bucyrus Co. in their construction and in the method of connecting them together.

The excavated gravel is dumped into a rotating

(Fig. 3) by buckets; this is known as the continuous or close-connected type. (Fig. 4.)

Where there are a number of large boulders pres-

ent in the gravel, the close-connected type is not advisable, because the boulders that are too large to go through the grizzly get wedged in the buckets and are very hard to get out.

*Copyrighted.

There is not much to choose between these two dredgers. Local conditions must guide the engineer in his selection.

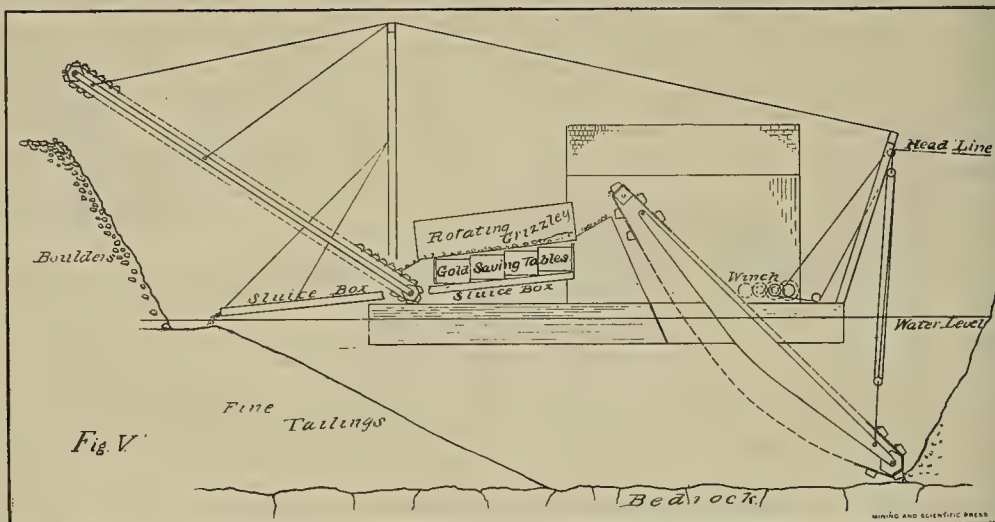

Fig. 5 illustrates a type of dredger that was developed in New Zealand, and a number of them are in operation in California. These dredgers, which are

grizzly; the screened material passes over special gold-saving tables and, falling into a small sluice box, is conveyed to a sump, from which it is lifted by a

centrifugal pump and discharged above and astern of the dredger.

It is not necessary to keep this sand pump running

Pacific Coast Smelting and Refining Works, Copper King, Ltd., Suisun Bay, Cal.

Smelting and Refining Works, Copper King, Ltd.

The growing interest in mining and smelting on the Pacific coast is manifested in the recently completed smelting works of the Copper King, Ltd., illustrated herewith. These works were put in commission last April for the ores of the Copper King mine, located in Fresno county, Cal., but they have since that time been increased to double their original capacity, and they are now prepared to handle over 200 tons of ore per day and within the next sixty days expect to increase to a capacity of 300 tons per day. We have the assurance of the management that the company is prepared to increase the plant to meet the de-

mands of the business, whatsoever they may be. The company is now in the market for the purchase of all gold, silver and copper ores. The plant is fully equipped with sampling mills, ore roasting buildings, smelters and converters. This company enjoys the prestige of having poured the first bar of converter copper ever turned out on the Pacific coast. The first bar was poured on May 1st, 1901.

The smelter is located directly upon Suisun bay, Cal., 1 mile from the two trunk systems of this coast, the Southern Pacific and the Santa Fe railroads, to which they are connected by their own individual railway, thus giving them complete communication either by rail or water. In their operations they

use petroleum exclusively, not only for generating power but in the process of smelting.

The works are the ownership of the Copper King, Limited, and in the first instance, the erection of the works on the bay of San Francisco, was not contemplated. It was their intention to establish the same at their mines in Fresno county, Cal., but owing to the lack of water, fuels and fluxes, and furthermore, the possible difficulties that might grow out of operating there because of the injurious fumes, it was determined to establish smelting works on San Francisco bay, to handle not only the ore from the Copper King mine, but also to go into the custom business generally.

continuously; it is put in operation as occasion demands.

The coarse material from the grizzly is elevated and dumped behind by means of a stacker, which is either an endless chain of buckets or a belt conveyor.

The operator stands on the lower deck on the left side. The winch for hoisting the ladder and swinging the boat is placed handy.

A head line is used instead of spuds to hold the dredger to its work, and there are two side lines on each side of the boat, one at the bow, the other at the stern, to swing the dredger across the face of the cut. A dredger of this type with 3-cubic-foot buckets will handle 600 cubic yards per day under working conditions.

These dredgers are worked by starting digging on the surface and going straight down; the ladder is then hoisted and the dredger moved sidewise about the width of the buckets, which are lowered again, and the process is repeated until the full width of the cut has been dug out; the dredger is moved ahead by hauling in on the head line.

(TO BE CONTINUED.)

Mining and Metallurgical Patents.

Patents Issued November 5, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

MAGNETIC ORE SEPARATOR.—No. 685,817; W. P. Cleveland and C. E. Knowles, Joplin, Mo.

An electro-magnet mounted on a vertical axis and composed of core and shell between which exciting coil is wound, an annular magnetic gap in under face of magnet, a traveling conveyor of flexible material for carrying material across gap but arranged to leave a portion of gap exposed, a rotating brush arranged adjacent to exposed portion for removing material adhering to magnet, and an agitating device acting on conveyor.

ROASTING FURNACE.—No. 685,903; J. A. Bentley, Denver, Colo.

A muffle oven, a fire box, a stack, a hot air flue surrounding oven at bottom, rear end and top, and communicating at one extremity with fire box and at other extremity with stack, a feed channel communicating with oven, means for controlling volume of feed passing therethrough, means for preventing escape of hot air, gases, smoke and vapor and ingress of cold air through channel, a chute leading from oven through hot air flue and furnace wall for discharge of roasted material and for heating and admitting into oven atmospheric air, means for preventing ingress of cold air into oven through chute, means for exit from oven of air, gases, vapors and smoke, and means for mixing and moving along upon oven floor substance being roasted.

SEPARATOR FOR PLACER MINING.—No. 685,773; J. N. Lewis, Ann Arbor, Mich.

A plurality of sluice boxes, means for oscillating sluice boxes in a horizontal plane, transverse arms or brackets operatively connected with and supported by means and constituting supports for sluice boxes which latter have a pivotal or tilting connection with arms or brackets whereby the sluice boxes are adapted for inversion, and means for normally maintaining sluice boxes in horizontal position.

APPARATUS FOR REHEATING COMPRESSED AIR FOR INDUSTRIAL PURPOSES.—No. 685,911; T. A. Edison, Llewellyn Park, N. J.

A reheating chamber, a jacket surrounding it, a grate in chamber for carrying a combustible material, air pipes leading directly to and directly from jacket, an opening connecting space inclosed by jacket with interior of reheater below grate, whereby a portion only of air will be admitted into interior of reheater to support combustion of combustible material, and means for conducting directly heated air to discharge pipe which leads directly from jacket.

ROTARY WATER MOTOR.—No. 685,967; L. E. Boovist, Seattle, Wash.

Two concentric wheels adapted to be rotated in opposite directions, inner wheel having water passages therein formed in curves adapted to discharge water tangential to buckets on outer wheel, in combination with depressions formed between water passages of inner wheel on hub.

AMALGAMATOR.—No. 686,231; G. W. Lee, San Francisco, Cal.

The base plate, an inclined distributing plate connected to it by wall or plate, an amalgamating trough, an inclined cover plate terminating in a downward projecting flange which extends to within a short distance of bottom of amalgamating trough, a tapering feedway between distributing plate and

cover plate, through which ore or pulp flows by gravity, an ore or feed hopper upwardly projecting from cover plate, which hopper communicates with ore feedway, an ore sluice by means of which ore or pulp is conveyed toward feed hopper, a wall or plate surrounding depending flange of cover plate so as to form a waterway, wall or plate terminating slightly above surface of bath contained within amalgamating trough, a water-supply pipe arranged above cover plate and overflow gutter connected to amalgamating trough, into which base material or tailings is forced.

AIR COMPRESSOR.—No. 686,115; F. A. McRae and C. E. Robertson, Montreal, Canada.

An inclined water conductor communicating at its upper end with a water head, a cylinder, with inlet opening, lower end of conductor being connected to and communicating with opening, a series of upwardly extending deflecting vanes independent of one another, located within cylinder at opening, a blower for forcing air into cylinder, an air-conducting pipe leading from blower to a point within conductor and in close proximity to cylinder, a suitably mounted shaft located above surface level of water head, a pulley mounted upon shaft, an endless belt taking over pulley and extending to within a short distance of upper end of conductor, a series of tilting buckets pivotally secured to belt, a second pulley mounted upon shaft and an endless belt operatively connecting second pulley to blower, a water-discharge opening from cylinder and an air outlet from cylinder.

ORE CONCENTRATOR.—No. 686,088; J. Klein, De-sloge, Mo.

A rigid metallic frame, a number of strips secured to it and forming top of table, means for feeding ore onto table in a steady stream, a series of parallel metallic troughs or channels removably secured upon top of table and extending longitudinally on it transversely of feed of ore and tapering from front to rear of table, means for tilting table, means for retaining table in different positions and means for reciprocating table.

STEAM STAMP MILL.—No. 686,149; E. L. Sharpneck, Chicago, Ill.

A cylinder and plunger-carrying piston, a valve chamber, ports leading from valve chamber to cylinder at both ends thereof, a slide valve in chamber, ports leading from middle to each end of valve chamber through slide valve, exhaust passages leading from opposite ends of slide valve all opened and closed by piston in cylinder and adjustable exhaust-regulating means in one passage for controlling speed of exhaust from that end of slide valve in movement of piston.

Hydraulic Mining in Low-Grade Gravel.*

By WILLIAM H. RADFORD.

Having worked some rather low-grade gravel during the past season at a small profit, I give the actual figures, in the hope that other mining engineers interested in this line of work may thereby be induced to do the same, in order that we may all get more data on this little-ventilated subject.

The property here referred to is situated in one of the northern counties of California, where hydraulic mining is still permitted by the courts. The water right belonging to the mine is a good one, furnishing water during about nine months, whenever there is an average rainfall, and a fair proportion of the precipitation is in the form of snow. The ditch, about 11 miles in length, is cared for during the rainy months by two men, and during the rest of the year by one man; and the water cost last season, delivered at the mine, 0.69 cent per miners' inch. The season commenced in November, 1899, and ended the last of July, 1900. During this time 655,657 miners' inches (an inch equals 1728 cubic feet in twenty-four hours) of water were used for piping and for sweeping the bedrock at the end of the season. From actual surveys, this amount of water washed down 1,251,399 cubic yards of material, consisting of pay gravel lying on the bedrock, and varying in thickness from a few inches to 8 feet, and practically barren top material, consisting of mountain slide, carrying considerable broken rock, clay and soil. The banks varied in height from 50 to 130 feet, the average height being 63 feet. The grade of the sluices was 7 inches to 12 feet, the boxes being paved with block riffles 12 inches deep. Long bedrock cuts extended from the heads of the sluices to within a few feet of the banks, and were kept practically to grade as the work advanced. At first electric drills were used on this work; but as it was found that heavy blasting shattered the rock too much and caused slips, these drills were abandoned and hand-drilling was substituted. The bedrock cuts, run in black slate of poor quality, had to be constantly watched and in places timbered to prevent accident. Electric lights were used in the mine during the night time and in the tunnel while cleaning-up was going on. Seven clean-ups were made in the sluices during the season, and at the end of the run the bedrock which had been uncovered was well swept and everything piped down into the bedrock cuts; these were run down, carefully cleaned and creviced up. The result of the season's work was \$31,618.49, showing a value of only 2.52 cents per cubic yard for the material washed. The bullion obtained came from the following sources:

| | | Per cent. |
|------------------------|-------------|-----------|
| Sluices | \$27,315 40 | 86.39 |
| Bedrock ditches..... | 3,811 23 | 12.05 |
| Undercurrents (2)..... | 491 86 | 1.56 |
| | \$31,618 49 | 100.00 |

The undercurrents were run only three months and a half.

The cost of operation for the season was \$27,511.64, which, deducted from the \$31,618.49 of bullion produced, left a profit of \$4106.85.

The total cost was made up as follows:

| | Cost. | Cost per cu. yard. |
|------------------------------------------------------------------|-------------|--------------------|
| Cost of ditch, reservoir and siphon: Labor..... | \$2,670 99 | |
| Supplies..... | 115 55 | |
| | 2,786 54 | \$0.00223 |
| Washing (piping)..... | 2,401 05 | 0.00192 |
| Drilling in bedrock cuts: Hand-drilling.. | 1,050 91 | |
| Electric..... | 269 62 | |
| | 1,320 53 | 0.00105 |
| Timbering bedrock cuts..... | 157 39 | 0.00012 |
| Electric lighting..... | 598 62 | 0.00047 |
| Sluice building and re-pairing: Labor..... | 1,045 70 | |
| Supplies..... | 35 50 | |
| | 1,081 20 | 0.00086 |
| Blacksmithing | 644 02 | 0.00051 |
| Cleaning-up..... | 898 85 | 0.00071 |
| Moving pipes and giants..... | 6,124 91 | 0.00490 |
| Breaking rocks and clay..... | 158 37 | 0.00012 |
| Clearing ground for piping (cutting brush)..... | 3,088 69 | 0.00250 |
| General expenses, watching sluices, and odd jobs..... | 3,015 37 | 0.00241 |
| Supplies used in mine..... | 4,267 31 | 0.00341 |
| Taxes, office expenses, legal expenses, surveying, salaries..... | \$27,511 64 | \$0.02198 |

A resume of the season's work is as follows:

| | |
|-----------------------------------------------|-------------------------|
| Period..... | 9 months. |
| Water used..... | 655,657 miners' inches. |
| Material washed..... | 1,251,399 cubic yards. |
| Cubic yards per miner's inch..... | 1.91. |
| Area of bedrock uncovered..... | 7.314 acres. |
| Bullion produced..... | \$31,618.49. |
| Average yield per inch of water..... | 4.82 cents. |
| Average yield per cubic yard of gravel..... | 2.52 cents. |
| Average yield per square foot of bedrock..... | 9.8 cents. |
| Yield per acre..... | \$4,323. |
| Average height of bank washed..... | .63 feet. |

The washing of such poor gravel during the past season was due to the fact that the company was fin-

ishing up work on one of the benches before moving to another place, and, in doing this, had to wash a large proportion of rim gravel—that is, gravel not in the channel and usually of low grade. Though the profit obtained was small and the final result could hardly be considered a very satisfactory one, still it shows that, under fairly favorable conditions, gravel of quite low grade can be worked at a profit.

Losses in Copper Smelting.

R. C. CAMPBELL-JOHNSON, M. I.

As Cornwall has taught the present age the art of mining, so Swansea, in Wales, has taught the art of smelting. Let us see, then, what loss of copper they allow in their works, and later how far their more perfect methods are adaptable to other parts, or wisely to be modified to local conditions where from higher costs a greater loss of copper in the slags is justifiable. There is a perfect mixture, as a flux for smelting, of lime, iron and silica (quartz), added to the copper ore that will minimize the loss of copper in the slags formed to about one-tenth of 1% in the short ton—that is, two pounds of copper. Suppose, for argument, that the ore is half the burden of the furnace, and the fluxes are the other half of the burden. Then the loss on the ore is double what it is in the slags. This one-tenth of 1% is the acme of smelting, so, as well as the mixtures having to be correct, the furnace has to be in good running order, and the furnacemen to be skilled in order to attain it.

Therefore this acme is seldom attained and modifications are adopted. First, the cost of smelting worthless fluxes is high and another ore with some values in it resembling the fluxes in constituents is used. This, not being quite the acme, raises the loss of values in the slags. Then the furnacemen, when not on contract, have been known, during the night shift, to shut off the blast and take a siesta, by which proceeding the manager's mixtures are knocked endways. At Swansea, from the outer hearth of the furnace the slags are tapped with an upper launder into slag pots of a conical shape and the copper matte is tapped from a lower hole into sand moulds. When the slag in the pots is cooled off these are dumped on a slag floor. A man is kept to daily sample and examine these cones of slag. He spots any matte showing at the top of the cone where it has settled in the cooling, breaks that top off and sends it back to the furnace; also the last six pots, before the blast is shut off and the matte tapped, he invariably returns to be put through the furnace again.

Outside of these slags returned to the furnace he takes an average sample of the run of slags for the twenty-four hours. This sample is assayed by Parkes' assay. The general practice is to pass slags as clean containing eighteen-hundredths of 1% copper, equal to three and six-tenths pounds of copper on the short ton. Two-tenths or more of 1% are called four slags, and the whole run is by degrees remelted again. This loss in producing the first metal is the only loss in the whole process, since the slags, crumbs or skimmings, from the roasting—not calciners, called roasters on this continent—running down the converter and refining furnaces are remelted.

These Swansea methods are the most perfect employed in copper smelting, but in new countries where labor is high they have to be modified, resulting in a greater loss of values in the slags. First, the slag from the furnace runs into a stream of water is granulated, carried away and lost. Correct sampling is impossible, and accidental losses have to be pocketed against the less cost of handling. Secondly, too much blast is driven into the furnace and the amount daily smelted is larger in tonnage, but the loss in slags and fumes is heavier. Again, automatic feeding of the furnace is resorted to.

Should the tuyeres (the apertures in a furnace through which the blast enters) become chilled, and a snout of black burthen form on one side, showing that the furnace is out of running order, then by automatic feeding the furnace cannot be humored by feeding coke to that side to raise the heat, etc., and so be brought back into condition. This makes loss in slags, but still is compensated for by saving cost of labor. Ores have to be made self-fluxing by tricks in the trade, perhaps by using more coke, or methods of mixing green unroasted ore, or fluxing with first metal back again. The mixture, not being up to acme, creates higher losses.

All these modifications are adaptations to local circumstances, and probably pay in the long run. What, then, is the loss of copper in the slags under these modifications?

These facts about smelting are given to teach the public what to expect and enable them to see that they get it, or ask the reason why—so to familiarize themselves with smelting propositions, and not jibe at investing.

The public will promptly ask why do custom smelters only pay for 90%, pay the market price less 6 cents per pound, use dry, electric and other methods of assay then used to estimate their slags, and other leading questions.

These are the business of a custom smelter. If a company does not like it, let them put up their own smelting works and keep the profit in their own pockets. A nod is as good as a wink to a blind mule. —British Columbia Mining Record.

New Placers, Horsefly River, Cariboo District, B. C.

TO THE EDITOR:—You have no doubt noted the reports that a rich placer find has been made on the headwaters of the Horsefly river, in Cariboo district. As usual in such cases, the first accounts published are more or less exaggerated, and some of the publications are misleading and calculated to cause undue excitement and disappointment to many who will try to get to the new El Dorado before it is possible to do so. I will aim to give you the situation and conditions that exist at the present time. There is no doubt about the richness of the creek, which the discoverers named Eureka creek. There are also indications of rich creeks in the vicinity, as the gravel extends for a distance of 12 or 15 miles.

The Horsefly river is a stream about 100 miles long, emptying into Quesnelle lake, and is a part of the watershed of the Fraser river. It heads on the dividing range that divides the Clearwater, a tributary of the North Thompson river, and the Horsefly country. Eureka creek, on which the discovery was made, is a tributary of the south fork of the Horsefly and is about 200 miles north of Ashcroft, on the Canadian Pacific Railroad. It is reached over the Cariboo wagon road from Ashcroft to this point, a distance of 150 miles, thence by trail about 65 miles up the river, or by way of Horsefly lake and trail. It has been known for many years that there existed an extensive system of ancient or dead river channels covering a large area of country. They are traceable for 40 miles up the Horsefly. These ancient channels, though known to be rich, require large capital for development. Several companies have been operating in the district for several years and considerable gold has been taken out, and there has also been some extremely rich gravel discovered, but the output thus far has not been sufficient to attract mining men with capital.

About 60 miles above the mouth of the Horsefly the river forks, the branches running off into high mountains. At the forks, and for a few miles up the south fork, quite extensive deposits of gravel exist. Some prospecting has been done there and locations made. In June last the owners of the leases took parties in with a view of making a sale of the ground, not being able to equip it themselves. After prospecting the ground thoroughly they were so well pleased that they took a bond on the property for \$22,000, running until the 10th of November, 1901, when they expect to close the deal. Some of the present owners of the leases decided to go up the south fork on a prospecting trip. After a difficult tramp of 8 or 10 miles they came onto the present Eureka creek, where they found good prospects on the surface, in a few hours panning out over an ounce. Their provisions being about gone, they made locations, named it Eureka creek, started out for a fresh supply of provisions. On their arrival at this camp it made considerable excitement. As they had the gold to show, it was believed the find was genuine. They returned at once to do more prospecting. Quite a number went in and soon the whole creek was located.

Other creeks were found that prospected well on the surface, but, there being no trails, it was impossible for a man to carry tools, bedding and grub enough to last him more than a couple of days; so, very little prospecting has been done as yet. It is unfortunate that the discovery was made so late in the season, as the elevation is over 5000 feet, and the snow fall will prevent any more prospecting until spring. The discoverers on their return did more prospecting and, from what gold they got, believe they can make from \$20 to \$40 per day to the man on the creek.

The gold is of good quality, some quite coarse. They report the entire country covered with quartz. On Eureka creek, where the discovery was first made, and Fraser creek, which is some 4 miles above, immense quantities of quartz boulders cover the beds of the creeks. The formation is slate, with granite lying to the north.

Along the main south fork below these creeks for 10 or 12 miles there are extensive benches, all of which prospect on the surface. There is plenty of timber and water and the ground is covered with a heavy coat of moss. Many men have gone in to make locations, but little or no work can be done until trails are made and supplies got in.

At the present time it is simply a climb over fallen timber and underbrush. They could only make a mile an hour with the loads carried. It is simply madness to try to get in there now, as storms have already set in and much snow has fallen. There is hardly a doubt but there will be extensive placers discovered in the spring. Enough has already been done to attract the attention of prospectors next year, when there will no doubt be a great many go in.

There seems to be quite a territory that has never been prospected. There is not the least sign that there has ever been a white man on these creeks. Not a pick mark, ax mark or the evidence of any camp fire is anywhere to be seen. It is quite likely that 1902 will do as much to bring "Old Cariboo district" before the world again as 1862, when Cariboo first had her big boom.

R. H. CAMPBELL.

Harper Camp, B. C., Oct. 30.

* Trans. American Inst. Min. Eng., Mexican meeting, Nov., 1901.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ARIZONA.

COCHISE COUNTY.

The Melba M. Co. is developing the Alta mine, near Tombstone, which has been idle many years. A new hoist, boiler, gallow-frame and pump have been installed and the shaft has been repaired and is being sunk from the 150 to 400-foot level. The ore is lead and silver and copper glance. R. L. Hamlin is Supt.

GILA COUNTY.

The Black Warrior C. Co. (Amalgamated), at Black Warrior in Globe district, has under construction a sulphuric acid plant. Its capacity is expected to be 10,000 pounds of acid per twenty-four hours. The main building is 210x65 feet, height 31 feet. Besides the main, or hammer, building, there are towers and furnace room, the last 44x52 feet. The main building has three lead chambers for condensing the sulphur fumes as they come from the furnaces; No. 1 chamber is 200 feet long by 25 wide and 20 high; No. 2 chamber 162x25x20 feet, and No. 3, 5x25x20 feet. The Glover tower is 10x10 25 feet, and Gay-Lussac tower 7x9x38 feet, surmounted by tank rooms. About 60 tons of sheet lead will be used. Lead ore chambers are six and seven pounds weight per square foot. Pan for Glover tower is 4-inch thick and weighs forty pounds per square foot. All seams and joints are burned or joined with the hydrogen flame, making a solid lead joint. Special acid resisting brick is used in the towers. E. H. Benson, of Weymouth, Mass., plans and looks after the construction of the plant, and will manage on completion.

J. F. Force, president of the Bob Tail Mines Co., has bought six claims between Jay & Kelvin, on which F. D. Adams and a force of miners have been doing development work. There are two ledges, carrying gold values. The ore assays \$25 per ton. Development work will be continued.

The Columbia C. Co., of St. Louis, has bought sixteen copper claims in Globe district, and, it is reported, will erect a 50-ton concentrating plant and install a gas-engine hoisting engine. A shaft is down 254 feet, with levels at 100 and 200 feet, the shafts and drifts being in sulphide ore averaging about 8% in copper.

The Globe-Boston C. Co., owner of the Gallory, the Aztec and Pinal and several other claims and a millsite, near Globe, has sunk a double-compartment shaft 175 feet and has let a contract to sink to 400 feet.

GRAHAM COUNTY.

A strike is reported to have been made in the Harrison tunnel of the Shannon mine at Clifton. An ore body has been found which runs 10.54% of copper for the last 30 feet of tunnel driven.

MOHAVE COUNTY.

F. W. Zorn and L. A. Dickinson, of the Great West mine, near Kingman are arranging for the installation of a small milling plant. The mine shows large ore bodies and values with depth.

The Railroad mine, near Kingman, has been bought by the Gold Road Co. from J. H. Hooper, H. W. Kemper, L. Leutinger and J. F. Withers.

The Schee Brothers, of Santa Monica, Cal., who own the Pinkham mine, at Floride, say the mine has reached a depth of over 200 feet and is looking very well in the bottom.

C. L. Constant, of Kingman, says of the mine on the Big Sandy that the showing of tin on the property seems good. The ore occurs in a copper vein, but the outcrop is somewhat broken up. The mine has been bonded.

PINAL COUNTY.

A half interest in eight claims located in the San Carlos segregated "Strip," near Florence, owned by W. J. Parks, F. Richardson and associates, has been sold to C. B. Booth of Los Angeles, Cal., who holds a bond on the remaining half interest. It is the intention of Mr. Booth to develop the claims. W. J. Parks is Supt.

SANTA CRUZ COUNTY.

J. D. Burgess of Tucson is arranging to erect a 60-ton smelter at Calabassas, to reduce ores from his Montrose mine in the Josephine canyon, Santa Rita mountains, and to do custom smelting.

F. B. Wilson of New York, president of the Arizona G. & C. Co., says that the company proposes to get the smelter at Patagonia in operation at the earliest possible time, to receive ores from their mines and other nearby properties. G. W. Crowe is manager at Patagonia.

YAVAPAI COUNTY.

The Montana-Arizona C. M. Co., of which R. A. Bell of Helena, Mont., is

president and C. R. Lloyd of Butte, Mont., vice-president, is incorporated, capital \$250,000, to operate twenty-three mining claims in the Eureka mining district, near Hillsdale.

The Union G. M. Co., owning the Union and Liberty mines in the Crowned King Basin, near Prescott, is developing, with J. Luke as superintendent. A tunnel is being run on the vein, which is now in 700 feet. The ore carries good values in gold, silver and copper.

CALIFORNIA.

AMADOR COUNTY.

Sinking continues at the Lincoln mine, at Sutter Creek, and the shaft is now in slate containing numerous quartz stringers. The appearance of the formation, Supt. Voorheis thinks, is very encouraging.

The George Upton mine, near Plymouth, is putting up a 10-stamp mill. A boarding house has recently been erected.

Another very rich spot has been encountered in the Oneida mine, at Jackson, and considerable quantities of quartz showing visible gold taken out.

The Price mine, north of Plymouth, has been sold to a new company. Mr. Durst will be the new Supt.

At the Fremont Con. mine, at Drytown, a connection has been made from the Fremont shaft to the old Gover shaft and a large body of good grade ore developed. A contract has been made with the Standard Electric Co. for 500 electrical H. P. to operate the machinery of the plant. A 60-stamp mill will be erected. C. E. Furrington is Supt.

CALAVERAS COUNTY.

The Goat Ranch mine, near Keystone, has been bonded by A. S. Poole to some parties who have sunk 100 feet on the ledge and crosscut 26 feet. From the surface down the rock, which carries gold and copper, increases in richness. It is said the gold values now are about \$35 or \$40 to the ton and the copper about \$15.

The Wilbur-Womble mine, near San Andreas, has suspended operations pending the installation of new machinery. The 6-stamp mill is to be increased to eighteen stamps and steam power for the mill and hoist will be put in.

The Wright & Lane M. Co. is operating the Alta mine, near Copperopolis. The dam on Little John creek has been completed, making a 100-acre reservoir, and 7½ miles of 8-inch iron pipe has been laid to the mine to supply the batteries. The dam is 60 feet wide on the base and tapering to 20 feet at the top. It is 324 feet in length on top and about 100 feet on the bottom, with an average height of 35 feet, the pipe opening 30 feet below the top. The 40-stamp mill is completed and will be run by electric power supplied by the Stanislaus Power & Water Co. In the old 10-stamp mill some 55,000 tons of ore have already been crushed with good returns. In the mine so far neither hanging or foot wall have been discovered, though at a depth of 200 feet it has been crosscut for a distance of 600 feet, all in vein matter, which shows good prospects. The mine will be worked by open cuts from the surface, dropping the ore to the tunnel at a depth of 200 feet, whence it will be run in cars to the mill. In this way all necessity for timbering will be obviated.

Mr. Bates of Duluth, Minn., has bought the group known as the Beatrice, 2 miles west of Murphys, and has placed a superintendent in charge of the mine, who will operate it. There is a 10-stamp mill on the property.

It is reported that the Lightner Co. is working its sulphurets in its new chlorination plant in such a manner as to save 97% of all the values worked. The new electric power tramway from the mill to the chlorination plant—1500 feet—carries 1600 pounds of sulphurets every fifteen minutes in buckets, each holding 100 pounds.

At the annual meeting of the company, held in Stockton, the old Board of Directors were re-elected. C. M. Jackson of Stockton is president, B. F. Wellington, Jr., secretary and A. Chalmers superintendent at Angels.

EL DORADO COUNTY.

A 60 A. P. boiler and engine from the Union mine and a 40 H. P. hoist from the Pocahontas will be installed on the Old Pacific mine, at Forest Home, near Placerville.

The Mammoth Bar and other mines on the American river have shut down until next summer.

F. S. Chadbourne has bought of the Larned estate, for Pennsylvania people, the slate quarries at Placerville, formerly leased and operated by the Placerville Slate Co., and will proceed at once to operate them on a large scale. A compressed air plant will be installed. The use of slate on the Pacific coast is increasing.

INYO COUNTY.

Willis & Roeper have shipped twenty-three tons of ore from the Green Monster mine, near Independence. A large body of shipping ore has been struck in the main tunnel.

KERN COUNTY.

(Special Correspondence).—The Democrat mining district, formed over twenty odd years ago, gives promise of a revival of life. Considerable development work has been done in the district in the past two years. The Mineral Spring mine, owned by O. W. Meyers, has had a new steam power arrastra put up on it, but has been found unsatisfactory and is now shut down for remodeling, so as to use a cyanide solution while the crushing is being done.

Development work is being done at the Gem mine; the 2-stamp mill at the upper tunnel is running continuously. The tunnel is in about 700 feet on the ledge; it was started to drain the old shaft 350 feet in from the mouth, but a blend shoot of ore 45 feet long, averaging 2 feet wide, was struck before reaching the old shaft. At the foot of the shaft the first worked shoot, about 40 feet long at the surface, extended out to 95 feet at the tunnel level, running from 20 inches to 7 feet in width. The lower level has been run to tap the lead 350 feet below the upper level. It will require about 600 feet of a crosscut, of which 290 feet is built. The rock is a blue granite, and drilling by hand is necessarily slow. The ore thus far milled has paid from \$12 to \$70 per ton free milling, and about 400 tons of tailings which they are saving assay from \$7 to \$42 per ton, some of the ore being very base. The owners propose to cyanide the tailings in the future.

Kern, Nov. 6.

The Mammoth Coal Co. of Randsburg has contracted to have a 3000 H. P. electric plant installed at the Mammoth coal mines, near Randsburg, to furnish power for the mills and light for Randsburg, Mojave and Barstow.

MONO COUNTY.

S. Tokio of Bodie says that a 3-foot ledge of rich ore has been opened up on his Mt. Grant claim. He proposes to let a contract for a 400-foot tunnel that will tap the ledge 350 feet deep.

NEVADA COUNTY.

E. Tilley has decided to erect a new 5-stamp mill on the Midnight mine, at Nevada City. Provision is to be made so that five additional stamps can be added later.

C. Belden and associates, who own the Gold Bank mine near Mayburt, intend to erect a 3-stamp mill there shortly.

Supt. Rosenthal of the Pine Hill mine, in the Lime Kiln district, at Wolf, says that the ledge has been struck in the hanging wall at the 400-foot level, showing a good body of ore. The projected smelter is being arranged for early installation.

The old Talbot mine in Willow valley, which is owned by G. W. Welch of San Francisco, has been bonded to a company for \$20,000, and it is understood that they will commence work soon developing the claim.

PLACER COUNTY.

It is reported that the Ralston Divide G. M. Co. is about to abandon its mine in Long canyon and close down permanently.

A strike of rich quartz has been made in Buncie canyon, near Colfax, on the Red Bird and Buena Vista claims, owned by H. Newton of Lincoln and G. A. A. Tubbs of San Francisco. The ledge is from 4 to 10 feet in width. A tunnel has been run 60 feet on the ledge.

The Cedar Creek drift gravel mine, near Shady Run, is reported sold to the Tacoma M. Co. The company, it is said, will immediately commence the work of developing the mine. T. A. Rodger is Supt.

PLUMAS COUNTY.

The Reno owners of the Last Chance mine, near Beckwith, are putting a whim in place and will sink a shaft 200 feet deep. The present 200-foot incline reaches to a perpendicular depth of only 80 feet. It is claimed that the ledge is 8 feet wide and carries gold, silver and copper, the last named predominating.

At the Nelson mine, near Nelson Point, the tunnel is now in 600 feet. The gravel is reported to be paying about 90 cents to the carload, much of the gold being coarse. A new tunnel will be started by which it is expected to bottom the channel.

SAN LUIS OBISPO COUNTY.

At Adelaide the Karl Quicksilver M. Co. employs sixty men. A sixty-ton furnace is in operation and is turning out quicksilver. The Gould, the Bell and the Trafton mines will be producing quicksilver next year.

Cinnabar is being found in the neigh-

borhood of Adelaide, and prospectors are busy.

SISKIYOU COUNTY.

D. McCarthy, who had a bond on a group of sixteen copper claims near the Joe West country, has rebonded the group to a Hartford, Conn., company at \$170,000.

Captain De Lamar is reported to have bonded the McVey copper claims, at the head of Joe creek, in the Siskiyou mountains, near the State line, from W. H. Hamilton, S. McVey, L. F. Cooper and G. B. Adams of Crescent City at the price of \$200,000; \$10,000 down. The mine is located at an altitude of from 4500 to 5100 feet and is best reached from Jacksonville, in Oregon.

The Siskiyou mine, about 16 miles below Happy Camp, on the Klamath river, will be run with a full force this winter.

The Van Brunt, near Happy Camp, is ready for a big run, having lately completed a 500-foot bedrock tunnel, bottoming the deeper back channel.

Wood & Cuddihy will operate the Portuguese mine, near Bailey's, and have several men at work getting ready for the winter run.

J. O. Welch has sold his French creek placer mines, near Etna, to Pittsburg, Pa., people, represented by S. S. Stahl. Mr. Welch, who has been made superintendent, says that work will be commenced at once to survey for a ditch to take water from the headwaters of French creek. The ditch will be 9 feet wide, 5 feet deep and 4½ feet in width on the bottom and will supply water for eight giants, which it is proposed to operate. About fifty men will be worked all winter. The company has five lakes which will be used as reservoirs to store water for summer use.

TRINITY COUNTY.

A strike is reported in the Boulders mine at Carrville, the ore running from \$100 to \$300 per ton. G. L. Carr is one of the principal owners of the mine.

L. Greenebaume of San Francisco and C. A. Malon and S. Weil are prospecting 2600 acres of placer ground in Hay Fork, on which they propose to install a hydraulic plant. Black sand has been found on the land in considerable quantities, carrying high values in platinum, iridium and gold.

The pay shoot has been struck in the lower tunnel works of the Brown Bear mine at Deadwood. The tunnel is in 5000 feet. The shoot was struck in an upraise from the tunnel at a point about 700 feet from the surface and about 200 feet below the upper workings. The ledge carries the same high values as it did in the upper workings. When the ore body is opened by the advance of the tunnel heading it will give 360 feet of backs on the pay shoot and a depth of about 900 feet on the mine.

The mining town of Cinnabar was destroyed by fire on Nov. 9. Of the mining camp and plant the hoisting works only escaped, and that is damaged. The loss will approximate \$75,000. The town was built about the Altoona quicksilver mine. Several months ago all work was stopped at the mine, the ore having been extracted from the upper workings.

TUOLUMNE COUNTY.

The French company which formerly operated the Bown mine, near Tuttle-town, owned by Boye & Miner, under bond, but allowed the bond to elapse, are proposing to take another bond on the mine. The company put up a hoist and a 20-stamp mill on the mine. The mill has since been sold.

A rich strike has been made in the Jumper mine at Stent in crosscutting from the 200-foot level south of the main shaft. It is claimed to be an entirely new ore body parallel to the old vein. The vein is 12 feet in width and estimated at \$40 per ton.

At the New Era, near Carters, a new shaft has been sunk 200 feet, where the ledge shows 6 feet wide. Heinz, Carter, Wiltsee & Holland are the owners, the latter being superintendent.

All of the stock of the Soulsby Con. G. M. Co., which operates the Soulsby mine, at Soulsbyville, has been bonded to H. J. Sisty of San Francisco for eighteen months at \$150,000. The bond provides that Mr. Sisty shall have immediate possession of the property.

COLORADO.

FREMONT COUNTY.

(Special Correspondence).—It is announced at the Rocky Mountain smelter that the plant is expected to blow in within the next few weeks. Additional equipment has been provided to enable handling of all classes of ore. It now includes roasters for sulphide ores, a reverberatory furnace for the fine dust and a well-equipped refinery.

The Union plant of the United States Reduction & Refining Co. is expected to resume operations by December 1, with a

capacity of 400 tons of ore daily. During the temporary closed down period many changes have been made in the mill, which relate to methods of preparing the pulp for chlorination and the concentration of the tailings. At present the sampling department is running and handling about 200 tons a day, the pulp being placed on the bedding floor ready for the reduction plant. The ore supply for this plant comes from Cripple Creek district. Supt. J. Q. MacDonald states that the ores from that district are becoming higher in sulphur than formerly.

The Metallic plant of the same company is at present idle, though its 600,000 tons of tailings, which have accumulated within the last seven years, are being concentrated. There are twenty tables that make a coarse product, the latter being reconcentrated by five finer tables. The product resulting from concentrating over one hundred tons into one ton is shipped to the smelter.

The Dorcas pneumatic cyanide plant handled 2500 tons of ore during October, the average content being \$30 per ton.

Florence, Nov. 7.

The Sunset M. Co. has been incorporated and is operating in Copper gulch, near Florence. Copper ore has been encountered, assaying 12%, six ounces in silver and \$8 in gold. A crosscut will be driven to open up another body of ore. C. O. Rice is president, B. C. Watkins secretary and treasurer, and L. B. Paul general manager, with office at Pueblo.

The Portland Cement Co., the stockholders of which are principally Denver people, and the directors of the Colorado Co., operating near Florence, have combined and located the factory on the main line of the Denver & Rio Grande Railroad near Florence. The capacity of the plant will be 800 barrels per day, or 320,000 pounds. It will cost about \$250,000, and the factory will be turning out the finished product about July 1 next. Work upon the excavation for the foundation of the plant has commenced. The board of directors consists of M. D. Thatcher, C. E. Gast, A. Moore, J. B. Grant, W. F. Geddes and W. H. James of Denver.

GILPIN COUNTY.

(Special Correspondence).—The Running lode is being worked by the Gower Syndicate through a 625-foot shaft, there being eight levels in ore, from which shipments amounting to 100 to 200 tons a month are made. The ores are lead and iron sulphide, which are said to average \$100 per ton in gold and lead.

The Eagle mill, belonging to F. C. Came, is in charge of W. H. Coffin and is treating fifty to sixty tons a day in custom work. Plates and concentrators are used.

The Buckley mine, on Gunnell hill, owned by Lake Superior people, is being further developed, two drifts being run on the 500-foot level in opposite directions from the 600-foot shaft. J. H. Hooper is manager.

The Ontario-Colorado G. M. Co., in charge of H. C. Eastman, have a 665-foot shaft, 2000 feet of drifting on the vein and about 300 feet of winze work. The shaft house, 100x34 feet, includes blacksmith shop, machine shop, compressor room, as well as boiler and engine room and light plant. Considerable development is in progress and regular shipments are made to the mills and smelters. The company's holdings comprise about 3000 feet along the strike of the vein. The ores carry gold, copper, silver and lead.

A stamp and concentrating mill is to be erected on the property of the Bonanza & Union T. & M. Co. in Chase gulch, near Central City, whose workings are through a 1450-foot tunnel which goes into Maryland mountain. The construction will be in charge of S. A. Rank, with J. A. Gilmore in charge of the mine.

Central City, Nov. 1.

There were 513 stamps—rapid and slow drop—going in Gilpin county during October, all of them situated in Black Hawk, Perigo and at Gilpin. This number will be added to during the present month by the 25-stamp mill, rapid drop pattern, of the Avon G. M. & M. Co. in Nevada gulch, and the 15-stamp slow drop mill of the Booster M. Co. at Apex, in Pine district. Three new mills are to be erected, namely, the Gregory-Buell Con., in Central City, a 45-stamp rapid drop; a 25-stamp mill and concentrator in Chase gulch, and a concentration mill in Black Hawk for the Grand Central G. M. Co., which will have a capacity of from 50 to 100 tons.

GUNNISON COUNTY.

A strike is reported from the Silent Friend property, in the Pitkin district, by the leasers, E. Wiley and J. D. Parsons, Jr. The Silent Friend was recently bought from D. T. Sapp of Denver by the Reynolds syndicate operating at Pitkin. Wiley & Parsons are working under a lease from the old owners. The present owners have started a tunnel into Silent

Friend mountain to develop the ore bodies in depth.

It is reported that the Colorado Fuel & Iron Co. are negotiating to buy the deposits of manganese iron ore on the Cebollo river. The deposits form two immense mountains of iron ore that can be mined economically, but have remained undeveloped by reason of remoteness from railroad. B. W. Lewis of Gunnison is the owner.

The Gold Pick M. & M. Co. has been incorporated in Wyoming, to operate mines on Willow creek, 4 miles southwest of Vulcan, which is the local office. Ore from the claims gives as high as \$100 gold, 250 ounces silver and 50% lead. The claims are to be developed by a tunnel which will tap the ore bodies at considerable depth.

HINSDALE COUNTY.

A consolidation has been effected of the two companies formerly operating the California mine and Ocean Wave mill at Lake City. The California crosscut tunnel, which has been commenced, will be continued until the vein is reached, an estimated distance of 500 feet.

LAKE COUNTY.

Some important new work is being done by lessees on the old Denver City Con. property at Leadville. While the lessees have been taking out some zinc sulphide deposits and making occasional shipments during the year, they have now gone to systematic mining and development for richer ore bodies, and have already run across several feet of good iron ore, from which shipments have been commenced.

From the dumps of the old Gallagher shaft of the Mikado mine at Leadville, H. Dyatt is shipping 100 tons a day of dry siliceous ore that pays a nice profit to each ton. There are thousands of tons in this dump and a number of other big dumps are being sorted over in a similar manner.

It is reported that the Rialto M. Co., operating at Leadville, will resume operations. Managing Director G. L. Havens of Denver, it is said, will take personal charge of the work. The group consists of several claims lying in the vicinity of the A. M. W. and Greenback, in Graham park, and when work at the 1200-foot level ceased the ore shoot had been partially exposed.

LAS ANIMAS COUNTY.

A party of prospectors have been operating in the mountains west of Stonewall, and it has become public that a rich find has been made. The ore that has been taken out is said to average over \$100 per ton, and there is said to be plenty of it. It is understood that Cripple Creek mining men are behind the prospectors.

OURAY COUNTY.

The Caroline M. Co., operating the Virginus and other mines at Ouray, through the Revenue tunnel, is employing 200 men, a smaller force than for years. Development work is being done rather than stopping out ore. The Revenue mill has depended largely on water power, which is short this year, and may account for the reduced number of employees. To overcome this a new power plant is being built in Ouray that will be equipped with boilers, engines and dynamos large enough to supply 10,000 electric H. P., coal being used to generate the power. Numbers of mines during the past summer have put in compressed air and electric drill plants, and the cost of packing or hauling coal up to the mines, usually situated near timber line, is being found too great to permit working low-grade positions. Water rights being unavailable, coal furnishes the next cheapest power. To supply this the San Juan electric railway has been organized by Colorado Springs people, who have taken an option on some coal land near Ouray. As soon as a survey and estimates are made the company will build a power house near Ouray and transmit power to the mines by wire.

The St. Paul mine at Red mountain, Ouray, W. F. De Camp of Lake City, manager, has been closed down.

The Silver Link copper mine, near Ouray, shipped several cars of copper ore during the summer, which returned over 50% copper and several hundred ounces in silver to the ton. F. Seaburg, manager, will sink the shaft 100 feet deeper.

SAGUACHE COUNTY.

The Brock M. Co., operating a mine near Villa Grove, has so far this season marketed seven carloads of ore which smelted from \$34 to \$74 a ton in gold, copper, lead and silver. The shaft is 145 feet deep. Work will at once be commenced on a 650-foot tunnel.

SAN JUAN COUNTY.

Nine new mills, to be erected by as many different mining companies, are already planned for construction in the vicinity of Silverton as early in the spring as it is possible to go to work. Some of these will be erected by companies controlling mines

that are already large producers, while others will be built by companies that expect to become large producers next season.

The mill of the Contention M. & M. Co., operating the North Star at Silverton, is nearly complete and about ready to begin operations. The wire cables for the tram line are being put in place to connect the mine and mill before the weather gets bad.

SUMMIT COUNTY.

The Wellington M. & L. Co. has started operations on Mineral hill, at Breckenridge. The company controls several claims, on the south slope of the hill, which are opened by a tunnel in 800 feet. R. W. Foote is president and manager of the company and J. T. Hogan is attorney and secretary.

TELLER COUNTY.

The Elktion dump, containing 180,000 tons of mineral-bearing rock, has been bought by the Murrill G. M. Co., of Colorado Springs, on a basis of \$1.50 per ton, involving \$270,000. The Murrill G. M. Co. has bought eleven lots near the Elktion and it will build a tram road from the dump.

A. Pierce and associates have leased the south end of the Black Belle mine at Cripple Creek, and have ore in sight in a drift at the bottom of an 80-foot shaft that runs upward of \$40 in gold to the ton.

The Practical G. M. Co. has resumed work on the Pauper claim, south of Altman. J. McElwee, Supt. A contract has been let for 50 feet of drifting at a depth of 250 feet. The company is installing a larger hoist that will be driven by electricity.

A strike has been made on the Lone Star, at Cripple Creek, owned by the Anacoda Co., by J. H. Brown. At a depth of 30 feet, 18 inches of quartz is now being drifted on that runs better than \$100 a ton. The same shoot has been opened up by other lessees for a distance of about 400 feet from the first discovery.

IDAHO.

BLAINE COUNTY.

F. H. Parsons and T. Brennan of Hailey have bought a three-fourths interest in the Carey-Hampton group of claims above Ketchum for \$15,000.

D. B. Huntley, of Silver City, has sold his bond on the Idahoan group at Hailey to C. J. Sherry. Two veins have been exposed by the workings. One is of 2 feet of carbonates, the other 10 inches of shipping ore. Mr. Sherry says that he intends to keep at work on the claims.

ELMORE COUNTY.

E. W. Duncan is president, A. L. Morris vice-president and manager, and W. P. Cooper secretary and treasurer of the Neal G. M. & M. Co., which has been incorporated at Salt Lake City, Utah, with capital of \$30,000. It owns the Badger and North Star claims.

IDAHO COUNTY.

G. Rea of the Gold Crown Co.'s mine on Snake river, near the mouth of the Grande Ronde, says the tunnel is in 150 feet and has developed ore carrying gold and silver. It is expected to soon strike the copper ore seam opened in the upper workings, from which the company is getting out ore for shipment.

W. H. Dewey of Nampa and T. N. Barnsdall and S. B. Longfellow of Pittsburgh, Pa., have made the final payment of \$100,000 on the fourteen Thunder mountain claims which they had bonded.

W. H. Dewey has ordered of the Allis-Chalmers Co. a 100-stamp mill for his Thunder Mountain mine. The weight of each stamp is 1050 pounds. Three boilers and a 300 H. P. engine will be included in the plant. It will be taken in to the mine via Boise next spring.

KOOTENAI COUNTY.

The development of the Weber mine, near Lakeview, on Lake Pend d'Oreille, is opening some high-grade silver ore, which is being carefully sorted for shipment. It will run about 200 or 250 ounces silver, besides good gold values. About eighteen men are employed. Five of them are taking out ore, which is being shipped, and is said to average forty ounces in silver, with a little gold. The wagon road transportation at Hope is about \$2.50 per ton and the freight and treatment rate is \$7.50. Supt. McJimpsey says the mine is more than paying its operating costs.

The Gold Hill M. Co., owning the Monitor and Merrimac claims, near Coeur d'Alene, has built cabins and is driving tunnel on the Monitor. The company has sold a sixteenth interest in this claim to J. Haybault of Rossland, B. C., for \$1000.

SHOSHONE COUNTY.

The Granite M. Co. has been incorporated in Spokane, Wash., to reopen the old Granite mine, near Wallace. This property produced a net profit of \$600,000 before it was closed down in 1892. The office of the company is at Spokane and

its capital \$500,000. The incorporators are J. P. Keane, C. P. Chamberlain, W. S. Norman, J. Porteous and H. B. Nichols, all of Spokane, Wash.

An elevator plant on East Eagle creek near Murray, is being constructed. The water supply will have a pressure of 30 feet where work is to be commenced. The company which will operate is composed of the same people as the Coeur d'Alene M. Co. of Murray. It owns a large area of placer ground.

MONTANA.

CASCADE COUNTY.

A large body of free-milling ore, averaging from \$7 to \$10 per ton, has been struck in the Empire mine, at Empire, by the Superior & Montana Dev. Co. The plans of S. H. Brady, the manager, are to develop it so as to put a large amount of ore in sight before the mill is started.

FERGUS COUNTY.

(Special Correspondence).—The Whisk Gulch cyanide mill ran through 4200 ton during October and cleaned up \$2200. The ore carries some quicksilver, so the all the zinc slimes are retorted before melting. The Spotted Horse 20-stamp mill has closed down for the winter. C. J. Durell, the Supt., states that the mine development during the winter will be to open up the eighth and ninth levels, which will require about 1000 feet of drifting and sinking. A winze, equipped with an underground hoist, will be sunk in addition to the shaft, so that each level can be started in three places at once. As the ore seems changing, with tellurides appearing, it is believed a roasting plant will be required before the mill starts again.

The New Year G. M. Co.'s ropeway connecting the mine with the mill has been completed. A. B. Plumb, Supt. of the Gilt Edge mill, is operating an experimental roasting plant, testing the so-called "black ore," which has so far resisted reduction.

Maiden, Nov. 2.

The Ursus mine at North Moccasin, cyanide property, has been bonded to F. Flanagan for \$16,000 by G. B. Stuart and D. J. Burr, the discoverers and owners of the property, for eighteen months. The agreement requires Mr. Flanagan to thoroughly prospect and develop the property.

C. H. Williams and J. Wocasek have bonded a silver mining claim at New Year to Anderson Bros. of White Sulphur Springs at \$10,000 for one year, with a agreement by Anderson Bros. to work continuously on the property and develop it thoroughly.

J. Giroux is conducting development work on prospects opened up by him many years ago near Lewiston. He has taken out cyaniding ore which assays from \$2.6 to \$5.

The second shipment of bullion from the new King-Barnes mill, at Maiden, is valued at \$4500.

Development work has been done on the Banner mines, near New Year, and the operators, Akerley Bros., have uncovered a large body of cyaniding ore which assays from \$3 to \$5 gold per ton. A 70-foot crosscut has been made in solid ore which is situated in the lime and porphyry contact. J. L. Harmon of New Year has bonded his interests to the present operators for one year.

GRANITE COUNTY.

J. C. Duffey has incorporated the New York & Montana Con. M. & M. Co., its principal stockholders being Mr. Duffey, W. E. Deeney, G. Nissem, J. O'Meara and Mrs. McDonald of Butte. The property of the company are gold mines located in the Red Lion district, near Phillipsburg.

U. F. Hughes, who is operating mine on Gold creek, near Phillipsburg, is constructing a ditch to convey water to the placer ground. He says two other long ditches are also being constructed to bring water to the placer mines of the district.

LEWIS AND CLARKE COUNTY.

J. A. Rowand of Helena has bought the Winscott mine, near Helena.

W. A. Clark has bonded the Terr group at Blackfoot City, and has appointed M. Buckley superintendent to develop the property. The shaft is down 100 feet in ore carrying gold, silver and copper. It is intended to sink the shaft 20 feet deeper.

J. Beach, J. H. Wilson, C. L. Freericks and F. M. Keiser of Lake Lindner Mich., stockholders of the Columbia G. M. & M. Co., have been examining the Columbia mines at York. It is proposed to increase the capacity of the stamp mill at the mine from ten to thirty and possibly fifty stamps. A number of other improvements, including an air-compressing plant, are contemplated.

W. L. Brown of London, England, has bonded twenty-four quartz claims and 10 acres of placer ground in the Seven-U Pete district, near Stemple, for over

250,000. It is claimed that the group has upwards of 150,000 tons of ore in sight that will average about \$10 in gold, with some silver. It includes the Donnelly & Merritt properties, Hogan & Johnson claims, Johnson & Pierson claims and W. F. Howe properties. There is over 1000 feet of work done on the various claims. The stated plans of the new company contemplate the erection of a mill to treat 250 tons of ore a day. It will be a combination of stamps, concentration and cyanide treatment.

MISSOULA COUNTY.

The DeBorgia Copper M. Co. has been incorporated with office in Mullan, Idaho, capital \$100,000; by J. H. Wade and W. D. Greenough of Mullan, Idaho, T. S. Hogan and C. Hendrickson of DeBorgia, T. J. Warren of Butte, T. L. Greenough of Missoula and P. Larson of Helena; to develop a group of copper claims near DeBorgia.

The Oro Monarch Con. Mines has been incorporated, with Wallace, Idaho, as its principal office, capital \$2,500,000, by C. A. Wing of Spokane, Wash., J. E. Wing of DeBorgia, D. A. McKenzie, J. H. Taylor and H. A. Moore of Wallace, Idaho, to mine near DeBorgia.

Development work has been resumed at the House claims near Clifton, which had been closed for the installment of new machinery. At a depth of 300 feet ore bodies have been discovered. J. A. Porter is manager.

SILVER BOW COUNTY.

The Boston & Montana mine is installing in the 1200-foot level of the Leonard mine a pump which will lift 1000 gallons of water a minute to the surface. All of the company's mines at Meaderville are drained through this shaft.

NEVADA.

ELKO COUNTY.

It is reported that a rich vein of ore has been struck on Bull Run mountain, about 8 miles from Mountain City. The strike is about 4 miles above the Murphy mine, upon which a mill is now running.

ESMERALDA COUNTY.

The Consolidated Esmeralda Mines Co. of Hawthorne, Nevada, has been incorporated to operate the Lapanta and Palmico properties, and work will soon be commenced. Water will be brought to the mines from Cottonwood canyon and a cyanide mill plant erected. These mines have yielded over \$500,000. S. A. Knapp and R. J. Laws are the principal stockholders in these two mines.

LINCOLN COUNTY.

The Hillside C. M. Co. of Nevada has been incorporated to operate the Hillside mine at Bristol, and is closely connected with the Bristol C. M. Co., being under the same management. W. Gelder of Denver, Colo., is president and general manager of both companies. J. E. Gelder of Pioche is treasurer and local business manager. The ores from both properties will be treated by the smelter at Pioche, which is rapidly nearing completion. H. Klingender is Supt.

NYE COUNTY.

Reports from the new strike south of Butler City, Tonopah district, say an 18-inch ledge of \$200 ore has been developed and extends practically the length of three or four claims, and in places carries a seam of talc along one wall that assays as high as \$1400 per ton. Several leases have been let on it.

The Liberty Springs district, near Tonopah, is attracting the attention of a number of prospectors. Several large ledges of low-grade free milling ore are known to exist there, and lead carbonate ore, running well in both gold and silver, is also being found.

The last smelter returns received at the Tonopah mines was of date November 2. For the five days preceding, from October 28th to November 2nd inclusive, the net returns amounted to \$40,562.14, as follows: October 28th, \$6055.45; October 29th, \$15,265.78; October 30th, \$6595.94; November 2nd, \$12,645.07. This is an average of \$8112.42 per day for the five days. The net returns for the month of November will possibly exceed \$250,000, and this will only represent about 25% of the actual production of the camp. These net returns are the sums the mine owners receive after freight and treatment charges are deducted. The largest individual returns for these five days were as follows: To Brounger Brothers, Lease No. 36, \$8535.26; to the Tonopah Co., for ore from Clark shaft, \$5648.87; to Sinclair & Golden, Lease No. 50, \$5210.05; to Beauchamp, Tamblin & Co., Lease No. 32, \$3293.58. There were a number of returns from \$1000 up. The highest returns were 2860 pounds from lease 27, owned by Peters & Bass, gave a return of 247 ounces in silver and 62.35 ounces in gold, a total value of \$1350 per ton; 5820 pounds from lease No. 115, owned by McDonald & Co., gave a return of 455 ounces

in silver and 5.90 ounces in gold, or a value of \$363 per ton after the deductions. There were a number of returns of over \$200 per ton.

WASHOE COUNTY.

J. K. Miller and associates of Denver, Colo., have bonded 100 acres of copper land in the Peavine district, near Reno, at \$75,000. The present development consists of a 500-foot tunnel driven to open a copper ledge which thirty years ago is said to have produced large quantities of copper.

Morath Bros., Middah & Arnold of Cripple Creek, Colo., have bonded eighty acres of ground at Reno adjoining the Reno Star mine at Reno at \$60,000.

Ground has been broken for the Reno Star mill at Wedekind City, and it is intended to have the mill crushing ore by Jan. 1. The capacity at first will be twenty tons daily, but additional rolls can be added.

From the first 100 tons of ore plowed up by W. C. Williams from the surface of his claim at Olinghouse he has received \$3659 from the mint.

NEW MEXICO.

Work is being done on the White Oak and General Lawton iron mines, near Santa Rita, owned by Roach & Ashton of Silver City. The ore is found in practically inexhaustible quantities, and is a high-grade bessemer ore.

GRANT COUNTY.

W. H. Newcomb has resumed work on the St. Louis mine at Burros. The old shaft, down over 500 feet, is to be reopened and a new shaft will also be sunk on the Colwell to connect with the old workings.

The Sampson mine at Burros is having fifteen tons of ore treated daily at the mill at White Signal. Fifteen men are at work in the mine.

The Gem Turquoise & Copper Co. at Burros has put fifteen men to work upon its turquoise and copper properties and is making shipments of gems.

J. R. McKinnie, in the Central mining district, near Burros, has sold ninety-five acres of copper-bearing land for \$100,000 to the Savage G. & C. Co. of Colorado Springs, Colo., which also owns the Hanover Annex and Rattler lodes at Hanover. Mr. McKinnie is Supt.

LINCOLN COUNTY.

S. S. Doak, Supt. Iowa & New Mexico M. & M. Co.'s mine at Schelerville, says that the company contemplates putting in air drills, compressors and steam hoist at the Schelerville group, and that as soon as such equipment can be placed the shaft of the Homestake will be put down several hundred feet. Good ore and a well defined vein of copper, lead and silver now shows up at a depth of 150 feet, and it is the company's intention to hurry development until the mine is made a producer.

SOCORRO COUNTY.

The Mogollon G. & C. M. Co., which owns properties in Mogollon district, has begun active development work.

At the Last Chance at Mogollon the cyanide process will be installed. Development work is being done in the mine. E. Craig is Supt.

The Silver Bar mine at Cooney, owned by Colorado people, H. C. McGreary manager, is employing fifty men. A system of concentration is being tested, known as the "slum tables." It is claimed to save over 90% of the values in the ore. The development work in the mine at present is sinking from the 400-foot level to the 560-foot level.

OKLAHOMA.

It is reported that a rich find of copper and gold has been made in the mountains in Woodward and Wood counties. People are said to be stampeding to the locality of the strike.

OREGON.

BAKER COUNTY.

The Whitaker group, near Cornucopia, has been sold for \$20,000 to the Single Standard M. & M. Co. of Colorado, E. S. Tice of Denver, Colo., president and general manager and M. Baroch of Denver, Colo., secretary and treasurer. The mine has been developed by about 1000 feet of tunnel and shaft work, showing an ore vein 18 to 48 inches in width, which carries average values of \$10 to the ton. A two years' run of ore for a 10-stamp mill is said to be blocked out in the mine. It is the purpose of the company to at once erect a mill and concentrators on the property and an electric power plant to operate them.

J. E. Farris, a large owner in the Quebec mine, near Alamo, has sold his interest to J. W. Carr and associates. Mr. Farris will retire as director.

JACKSON COUNTY.

The Gold Chloride mine still holds its value in the ore. The depth in the main

tunnel is 50 feet, with 3 feet of milling ore. Mears, Landreth & Co. of Gold Hill, the owners, have opened up the vein in four different places and have found it as wide and rich as in the main tunnel. Eleven tons lately netted \$30 per ton.

JOSEPHINE COUNTY.

The Lyttle copper mine, near Waldo, has been bought by Capt. Draper, manager of the Waldo copper mine. The ledge is 22 feet in width and 300 feet of tunneling has been done on the property.

The Williamsburg M. Co. has been incorporated, capital \$500,000, by F. E. Forbes, T. J. McClum, R. G. Smith and L. A. Heberle of Grants Pass.

The Dry Diggings hydraulic mines, near Grants Pass, have been sold by H. A. Corliss to C. W. Ament of Chicago for \$25,000.

The Lyttle copper mines, near Waldo, have been sold by J. Lyttle to T. W. M. Draper of San Francisco, the owner of the Waldo copper mines and smelter, in the same district. The price paid was \$15,000.

LANE COUNTY.

The Rainbow M. & S. Co. has been incorporated, capital \$1,000,000, by J. Effert, W. S. Lamb and C. G. Steffen of Illinois. Roseburg is the principal place of business.

UMATILLA COUNTY.

A dredger is under construction in the John Day country, south of Ukiah, which will be finished some time next year. T. Pomeroy is superintendent of construction. It is expected to work 8 miles of channel bed which has been prospected by shaft.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Spearfish Co., has cleared away the debris of the fire and commenced the erection of a new cyanide plant. The company expects to have the new mill ready for operation within three months.

The Bertha mine, near Lead, operated under lease by P. Oberto, is shipping fifty tons daily to the Dakota M. & M. Co.'s cyanide plant at Deadwood.

Machinery of the cyanide plant of the Deadwood Standard Co. is being installed at Englewood. The plant will have a capacity of 200 tons.

UTAH.

BEAVER COUNTY.

The Chicago Investment Co. has bonded the Empire group at Frisco, consisting of three claims, for a year at \$20,000 from G. E. Lane and T. McHale of Frisco.

The Majestic M. Co. has made another payment of \$10,000 on account for the O. K. and Harrington-Hickory mines, near Milford.

E. W. Young of Salt Lake City has bought the Welsh Jolly Boy mine, which is located about 5 miles north of Adamsville. The property has produced considerable lead ore. A sample of galena taken from the old stopes by Mr. Young afforded over 70% lead, with thirty-one ounces silver and 60 cents gold per ton.

BOX ELDER COUNTY.

The El Amigo Co. of Park valley, W. Dix manager, has struck the vein in the main tunnel, in 550 feet. Samples indicate a value of \$19.22 per ton gold.

The Susie M. Co., at Park valley, O. A. Bailey manager, is making arrangements for a development of its proposition. Work will be continued through the winter.

GRAND COUNTY.

The Clara Copper M. & M. Co. has been incorporated at Salt Lake City, with capital \$10,000, to operate the Big Squaw, Zions 1 and 2, the Blackbird, and the Blackbirds 1, 2, 3 and 4 claims. W. C. Tracy is president, and H. C. Lund secretary.

IRON COUNTY.

The Oro M. & M. Co., owning the Hope, Beulah, Faith, Sentinel, Old Mack, Old Mack Nos. 2, 3, 4 and 5, Minnie R., Oro, Apex, Keystone and Fairview claims, has been incorporated with office at Milford; capital \$150,000. D. M. Tarry is president and R. L. Nolf secretary.

SUMMIT COUNTY.

The Sunrise M. Co. has been incorporated, capital \$20,000, to operate four claims at Park City, owned by J. C. Hasson. M. H. Hennessey is president and J. C. Hasson secretary and treasurer. About 200 feet of development work has been done on the property, and a shaft is being put down between the lime and quartzite to contact.

TOOELE COUNTY.

The Blaine G. & S. M. Co. has been incorporated, capital \$15,000. B. F. Fleiner is president, H. E. Grow secretary and B. F. Fleiner general manager. The company owns the Blaine, Mikado and Monitor and the Grove Spring mills in Death valley, about 30 miles from Stockton.

The Blaine G. & S. M. Co. has been in-

corporated; capital \$15,000. B. F. Fleiner is president and H. E. Grow secretary at Eureka. The company owns four claims in Death valley, west of Stockton.

WASATCH COUNTY.

The Park-Wasatch M. Co., owning a lease and bond on the Wasatch, Sampson, May, Little Giant, Woodland, Blaine and Summit claims, known as Hoyt's Wasatch group and located in the Blue Ledge district, has been incorporated, with office at Park City and capital \$150,000. J. V. Murphy is president and J. Fairhurst secretary.

WEBER COUNTY.

The Ogden Bollemaker M. Co. has been incorporated at Ogden, capital \$28,000, to operate the Boston mine near Ogden. O. H. Mohlman is president and F. M. Farrell, secretary and treasurer.

WASHINGTON.

KITTITAS COUNTY.

The Fortune M. & S. Co. is operating a mine 25 miles from Cle Elum, on the line of Chelan and Kittitas counties. G. W. Daines, of Danville, Ill., is president and general manager, with office at Spokane. T. Collier, Supt., says the company owns nineteen claims with two leads from 20 to 50 feet wide showing on the surface. A 1050-foot tunnel is being driven to open one of the leads 800 feet down. The tunnel in 900 feet has cut six blind leads.

SPOKANE COUNTY.

The Crystal M. Co. at their annual meeting in Spokane elected J. L. Prickett of Spokane president and J. Gray of Spokane Supt. Plans were outlined for the further development of the mine, on the Spokane Indian reservation, and for a mill on the property to treat the ore.

The Oregon Gold Fields Placer Co. has been incorporated, capital \$75,000, to do a general mining business, with office in Spokane. The trustees are W. T. Turnham, C. D. Crane, S. Trapschuh, F. Nagel and W. O. Appelquist.

WYOMING.

CARBON COUNTY.

In the 115-foot level of the Rambler mine, at Battle Lake, while laying track, a 2-foot vein of black oxide of copper was uncovered. Several blocks of ore, which were thought to be only green carbonate stain and have been overlooked for years, now prove to be nearly solid copper glance, simply coated over with wash and copper stain. One piece found buried in the dump recently will weigh half a ton and is a solid mass of copper glance.

The Battle Lake Tunnel Site Co. at Battle Lake is in 701 feet with its tunnel and is making over 100 feet per month. The formation is changing and quartz strata have been cut that are rich in copper, while the diorite in the face is full of copper pyrites.

Williams, Lamb & Wellman have bought the Crown King claim of W. Cayzer, near Encampment. The mine is developed by a shaft and two tunnels, all of which show good copper.

STEVENS COUNTY.

The Big Strike mining claim on Fish creek, 12 miles east of Boundary City, is shipping ore. J. Keough, one of the owners, states that arrangements are now being made to have the ore treated at the Nelson smelter and that regular shipments would continue during the winter. The ore is silver-copper and very rich, paying the heavy expense of packing over a rough mountain trail a distance of 5 miles to a wagon road, and from there a haul of 7 miles to the nearest railway station.

SHERIDAN COUNTY.

W. T. Barrow says he is preparing to put up a mill on his claims near Sheridan in the spring.

FOREIGN.

BRITISH COLUMBIA.

The Rambler-Cariboo M. Co., operating a silver-lead proposition in the Slokan district, has paid \$120,000 in dividends to date. At present the output is \$30,000 per month. The ore averages about \$100 a ton, mostly in silver, which runs 150 ounces. A new concentrator has been installed at a cost of \$12,000 and has begun operations. This improvement is expected to double the output of the mine.

An iron ore deposit has been found on the Lord Roberts property, near Rossland. The owners are M. McIver and S. Forteach of Rossland. The ledge has been stripped for a width of 40 feet. Samples of the ore assayed 62.9% specular hematite and \$4.40 gold. The ore has some immediate value as a flux for lead smelters, and, it is believed, may prove utilisable for iron smelting.

The yield by dredging of the Saskatchewan river gravel during the past season has been found to be about 25 cents per cubic yard. Mr. Hobson, manager of the dredgers, speaking of the prospects, said:

1. The first of these is the fact that the
the first of these is the fact that the
the first of these is the fact that the

SITUATIONS WANTED.

ASSAYER WANTS POSITION AT A LARGE gold mine. Thoroughly competent, with wide experience as assayer at copper, silver and gold mines. Now assayer at big mother lode mine. Address R. A. A., care of Mining and Scientific Press.

POSITION WANTED BY A MAN WHO HAS technical education and twelve years' experience in metal mining; seven years as superintendent. Speaks Spanish. Best of references. Address H., care Mining and Scientific Press.

YOUNG MINING AND MECHANICAL ENGINEER would like position in office as draughtsman, etc. Accustomed to turning out artistic mapping. Good field and mine surveyor. Box 92, this office.

WANTED.—A position by a first-class all-round millman. Understands amalgamating and concentrating and care of mills. Twenty-five years' practical experience. Arizona or Mexico preferred. Satisfactory references given. Address "Millman," care Mining and Scientific Press.

MINING ENGINEER, graduate Mass. Inst. Tech., with thirteen years' experience as mine and surveyor for large copper company in Montana; superintendent of coal mine, washer and coke oven plant and railroad in South for six years; in charge of zinc property in Missouri; familiar with concentrating methods; at present in charge of cyanide operations of tailings pile in California, desires position with reliable company. Open for engagement after October 15. Address B. J. M., care Mining and Scientific Press.

WANTED.

PARTNER WITH SOME MONEY, ASSAYER preferred, wanted by expert chlorinator and millman for running a custom chlorination plant in good locality. Reply to "Chlorination," Mining and Scientific Press, San Francisco, Cal.

Wanted, to Rent or Lease an Assay Office Complete in San Francisco.

State terms and particulars. Address "Business," care this office.

WANTED....Tailings (Gold) in Washington, Oregon, Idaho, Montana, Dakota, Wyoming, Utah, Colorado, New Mexico, or British Columbia. Address full particulars to Miner, Box 102, Los Angeles, Cal.

FOR SALE.

CHAS. E. BILLIN & CO., CHICAGO, ILL.

Solicit correspondence from parties having for sale complete

Mining, Milling, Smelting, OR OTHER PLANTS.

We will purchase for cash if in good condition.

We purchased last spring and have dismantled and resold the Diamond Hill mill, 120 stamps, vanners, water power, etc. Montana Gold Mining Co., 6 Huntington mills, power, etc.

FOR SALE. PELTON WATER WHEEL POWER PLANT, CONSISTING OF

Two 39-inch Pelton Wheels on same shaft, especially designed for heavy duty. Each wheel designed to generate 350 H. P. with head of 172 feet. Complete in all details—heavy floor stands, with ring oiling bearings; steel housings; steel floor beams; four throttle valves and electric governor. Plant guaranteed good as new. Ran about four months. Together with 148 feet of 42-inch double riveted steel flume.

ASSESSMENT NOTICES.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of November, 1901, an assessment (No. 1) of two cents per share was levied upon the capital stock of the corporation, payable immediately to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

MORICAN MINING & MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of November, 1901, an assessment (No. 2) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 300 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 8th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

JNO W. CLASSEN, Secretary.

Office—No. 300 California street, San Francisco, California.

THE CALIFORNIA DREDGING COMPANY.—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of October, 1901, an assessment (No. 3) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, 120 Sutter Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 25th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

SAM. W. CHEYNEY, Secretary.

120 Sutter Street, San Francisco, California.

AMERICAN OIL AND REFINERY COMPANY.—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of October, 1901, an assessment of five (5) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No. 323 of the Parrott building, Nos. 325 to 335 Market street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 25th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23rd day of December, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

J. C. ANTHONY, Secretary.

Office—Room 323, Parrott building, Nos. 325 to 335 Market street, San Francisco, California.

YUBA CONSOLIDATED GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of October, 1901, an assessment (No. 4) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 801 of the Claus Spreckels Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of November, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of December, 1901, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.

Trade Paper Advertising.

It is very easy to go wrong in the matter of trade paper advertising. One temptation is to go into several without much reference to their circulation, stability, value, influence, or reliability, but there is hardly ever more than one paper in a trade that is first rate as an advertising medium. Since it is the leading paper in that trade, it is apt to reach nearly everybody of consequence in the business, whereas the circulation of the others, or of most of them, is likely to be largely a duplication. There are apt to be several very good reasons why that particular leading paper is the leading paper. It has the right kind of matter in it or it wouldn't be subscribed for so generally. It is usually on a firm foundation, and hence it conducts all of its affairs purely on a business basis. No fear, no favor; the same treatment for all, and that fair business treatment. All this, besides giving a publication the effective support of the trade—by means of which it is enabled to make money and to be independent—also gives the publication a character for reliability which helps the advertising as well as the reading matter—helps to make the advertising interesting, helps to make the reader think that the advertising is true. Another mistake that some make in reference to the trade paper is that they just put in a card—any old thing will do, you know—and let it go at that. The space that they buy is their own. Why shouldn't they make the best possible use of it, then? Why shouldn't they take pains with the preparation of their copy? Why shouldn't they change the matter often, perhaps in every issue? Why shouldn't they assume that the reader of the paper in question will follow the advertising pages generally, and their own advertising matter in particular, if there is live, fresh news in them?

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

SEND FOR FREE ILLUSTRATED AND DESCRIPTIVE CATALOGUE TO

MANUFACTURER OF

## Mining Machinery

There are  
reasons  
why

the adjustable and practically indestructible GATES ROCK AND ORE BREAKERS produce crushed material at a much lower cost per ton than other breakers. To more than 5,000 users located in all parts of the world, the cause is readily apparent. Gates Breakers not only have much greater capacity, require less power, run without vibration, stoppage or delay, with less wear on the crushing surfaces and permitting carloads of material to be dumped directly into the hopper of breaker, thus reducing the employment of handling devices and manual labor to the minimum, but other convincing reasons supported by indisputable evidence of the superiority of Gates Breakers are given in Gates Catalogue No. 1. Avoid a false start and possibility of failure. There is absolutely no breaker made that will compare with the "Gates."

We are prepared to build crushing plants complete, screens and perforated metal of all kinds, elevators, hoists, engines, and boilers. We also build cement machinery of the latest designs. ESTIMATES FURNISHED UPON APPLICATION.

# PATENTS

OBTAINED  
IN ALL  
CIVILIZED COUNTRIES.

EXPENSE SAVED INVENTORS BY  
PRELIMINARY SEARCHES.

COMMUNICATIONS CONFIDENTIAL.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports since 1793, with full copies of U. S. Patents since 1872. As a result we are able to give reliable advice as to the patentability of an article, frequently saving the inventor the cost of an application. Our Washington branch tends exclusively to our business before the Patent Office. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, including filing of Caveats, Trade-Marks, Copyrights, Labels; prepare Assignments, Licenses and Agreements; give Opinions on Patentability and Infringements, etc. Circulars free on application.

NEW STANDARD CONCENTRATOR.

## ADAPTABLE TO THE ORE--THE AMERICAN STEAM STAMP

will run without close attendance after being easily set to deliver the blow best suited to the ore; very rapid heavy blows for tough hard ore, gentler treatment for slimy friable ore.

THE MILL FOR FRONTIER USAGE--THE AMERICAN STEAM STAMP

has the "steam hammer" valve and the "wedge base" adjustment for wear of shoes and dies. These work perfectly with unskilled handling. The American gives no trouble, is durable and unailing.

Though built for heavy and continuous service, it requires only small foundations, thus avoiding any great expense or labor in installation. We make the mills sectional for muleback when so ordered. We also make gravity stamps.

**American Engineering Works,**

Cable: "A M E W," Chicago.

## W. & P. CYANIDE PAINT.

THE VERY HIGHEST GRADE OF PAINT OR COATING FOR

Cyanide and Chlorination Tanks and Vats, FLOORS, SINKS AND TRAYS,

Or wherever acids, alkalis or water are used. Excellent also for REFRIGERATORS, being odorless when dry. It is a pure asphalt paint, and therefore unaffected by acids or alkalis. Dries very rapidly to an extent sufficient for handling or for application of second coat, but its full hardness is not attained for some hours, as drying is retarded by use of a heavy oil, and durability of coat is thus greatly increased. When dry is very tough and not brittle like most asphalt coatings. No carbon bisulphid, ether or other poisonous ingredients are used in its preparation, and as it gives out no noxious fumes or gases it can be used in perfect safety in confined places. For purposes given this paint is the equal of any other paint made, no matter if sold at double the price.

In Barrels, - - - 60 Cents per Gallon;  
In Cases, - - - 65 Cents per Gallon.

Can be ordered through the trade. Insist on your dealer getting W. & P. CYANIDE PAINT for you or write us direct.

All of our latest improvements are embodied in this instrument and it is the result of our 18 years' experience in building balances.  
 Among the noteworthy features in the make-up of this balance is the improved adjusting device, herewith shown.

The adjusting device will appeal to the assayer as the simplest and most convenient means of checking the beam, and consists of a star wheel on a threaded arbor, mounted on the center edge back of the beam.  
 By turning this wheel backward or forward, it is moved along the arbor and so adjusts the beam to equilibrium.

## Addressing Readers Personally.

Advertisers who avoid or neglect the use of the pronoun "You" overlook a colloquial element which is both easy and effective in operation. Whenever an advertisement is being read some individual is in front of it. Under these circumstances, why should not the advertiser's message be delivered as from man to man? Take the case of an advertiser who is employing space in a widely circulated weekly journal like the MINING AND SCIENTIFIC PRESS, and who is prepared to give his advertisement a few minutes' attention every week. Let such advertiser jot down from time to time the strongest arguments that he can think of why his goods should be purchased—such arguments, for example, as he or one of his travelers would use when addressing a prospective purchaser. Let him then imagine once every week that he has such prospective purchaser standing in front of him, and let him write down in a few terse sentences precisely what he would say to such a person, using the pronoun "You" in the colloquial style while doing so. There would be a freshness, an originality, and a vitality about a weekly talk of this kind, conducted through the columns of so well circulated a paper, which would quickly make its mark, and yield the advertiser who adopted the practice a satisfactory profit.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## Roof Protection

The roofing you use ought to give your building roof protection.

It's absolutely worthless if it doesn't do it.

It's worse than worthless—it's an extra expense to tear it off or cover it over.

When you buy a roofing, here is what you must consider:

Is it water-proof?

Can the sun-heat melt or injure it?

Will the cold crack it?

Will it sweat and rust?

Will it contract with cold or expand with heat?

How will it stand sulphur smoke or fumes of any kind?

Will it warp or curl?

Will it become brittle and flake off?

How about the fogs?

Will insects bother it?

Will it keep out heat and cold?

Will it last?

Is it easy to apply properly?

What's the freight rate?

What's the drayage?

P & B Ready Roofing is the only roofing made that can stand all the tests a perfect roofing ought to stand.

It's the right roofing and the only roofing a careful, conscientious, honest builder will ever use.

Send for our booklets—address Department A.

We introduced the use of Liquid Fuel Furnaces for Assaying twenty years ago, and received the only award and medal for Hydro-Carbon Blow-Pipes and Assay Furnaces at the World's Fair in 1893. We are still manufacturing

## Hoskins' Standard Hydro-Carbon Burner FOR ASSAY FURNACES.

Always guaranteed and cleaned or repaired FREE of charge.

For sale by Dealers in Assayers' Supplies everywhere, or by Ourselves.

All inquiries fully answered. Write for circulars and prices of our TIME PROVEN FURNACES FOR ASSAYERS.

In the issue of this paper of Oct. 12 we illustrated our new COMBINATION FURNACE.

WM. HOSKINS & CO.,  
81 SO. CLARK STREET, CHICAGO, ILL.

## SOME HAVE WATER, BUT ALL HAVE AIR!

All ores which can be concentrated with water, and some ores which slime, yield their values when treated by the

### HOOPER PNEUMATIC CONCENTRATOR,

Which uses no water, is a marvel of simplicity and durability and requires but little power.

ARID DISTRICTS AND GREAT ALTITUDES  
ARE NO LONGER OBSTACLES IN THE LOCATION OF YOUR MODERN MILL.

Address

SUITE 1402.

GENERAL CONCENTRATES CO.,

NO. 128 BROADWAY.

NEW YORK CITY.

## THE BARTLETT CONCENTRATOR. THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its  
Advantages:

Wearing parts reduced to a minimum. All parts are interchangeable.  
Will take ore from finest mesh up to 6-mesh without sizing.  
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.  
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD.  
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

## The Lunkenheimer Automatic Injector

For All Classes of Steam Boilers.

Well designed, compact, efficient, durable, low priced  
and reliable. In action it is easy to start, has large  
range of work, full capacity, is absolutely Automatic and  
the discharge can be graded within wide limits. All  
parts are well proportioned, strong and durable, and any  
worn-out piece can be easily and quickly replaced at  
slight expense. Starts low at 22 lbs., works high to 185  
lbs. Feed water 76 degrees, lift 3 feet, works without  
adjustment of steam or water at pressures from 60 to 180  
lbs. Automatically restarts if operation is temporarily  
interrupted. Tubes are easily removable for examination  
and repairs by the simple use of a common wrench. De-  
void of small parts which are easily lost or unreliable in  
action. Fifty per cent more durable than any other ma-  
chine of its class. Retains original efficiency under con-  
stant usage and slight wear on tubes will not impair its  
operation. Works well with hot feed water and on long  
lifts. Impartial tests solicited and satisfaction guar-  
anteed. Specify the Lunkenheimer Automatic Injector  
and order from your dealer. Send for descriptive circular  
and catalog of engineering appliances of superior quality.

## THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

JAS. S. BROWNELL, San Francisco, Cal.—DEAR SIR:

We have been using your "Patent Lip" flange belt on our "Triumph" Concentrators since May, 1895, and find that they have given better wear than any other belt made. Also the twelve 6-foot Frues with "Patent Lip" flange belts, lately put in here, are giving us every satisfaction.

THE EMPIRE MINES,  
GRASS VALLEY, NEVADA CO., CAL., Jan. 29, 1901.

Yours truly,  
G. W. STARR, Managing Director.

JAS. S. BROWNELL, San Francisco, Cal.—DEAR SIR:

The eight "Patent Lip" flange belts purchased from you in December, 1895, have been in constant use in the mill since that time, and have given the best of satisfaction, and have proved to be far superior to the old plain flange belt which we were using. The belts now in use show hardly any wear, and seem to be in as good condition as when first put on the machines; one thing, they do not show any tendency to crack along the edge of the belt.

PIONEER-LYNN MINING COMPANY,  
TOWLE, PLACER CO., CAL., Jan. 12, 1901.

Yours truly,  
JERRY SULLIVAN, Superintendent.

## Quartz Prospecting in California.

The accompanying illustration of an overshot water wheel, connected with a simple hoisting gear, and the uncovered prospecting shaft, are characteristic sights in the gold quartz mining districts of California. It is an economical, useful type of mine rig, and though the development of conditions when the miners were compelled to design and make their own mining appliances from the crude materials closest to their hand, it survives, and is in as common use at this time as ever before, simply because of its superior cheapness and adaptability to the prospectors' use.

These wheels are made from 24 to 30 feet in diameter. No great technical skill is required to build them. The nearest stream or ditch furnishes the water supply to run them. With a little additional timber and blacksmith work, the same wheel will furnish power to work a Cornish pump and to run an arrastra or prospector's mill.

The entire plant is entirely within the prospector's constructing knowledge and his means. The latter is particularly important to the prospector, as his object in prospecting is to get means. With this rig replacing the hand windlass, quite extended workings can be carried on to depths as much as 250 feet, provided, of course, that the water flow is not large.

Quartz prospecting in California is more exactly definable as small mining. The occupation is engaged in for the profit in it. Outside of the prospector's labor, there is little expense attached to it. Explosives, candles, a few tools, and these small operations, involving next to no capital but the owner's time, are profitable on very low-grade ores. There are many instances where, with simple, inexpensive hoisting and milling plants, ore that only went \$4 to \$5 to the ton has paid high wages to the owners doing their own mining.

There is nothing of the sensational about this kind of mining. It is not a great business. It is, though,

a most independent occupation. These miners of gold are not bothered with combinations to restrain overproduction; they do not have to guess which way the metal market or the stock market is going. Producing gold, they compete with no one in any other industry.

Large mines and great mining plants are unquestionably of great economic value to a community. Little mines with their primitive but efficient installations are not, however, to be overlooked. If anything, they form a more certain industrial resource for a mining district than a big single mine. Particularly is this true of gold mining. The large producer from mining of other metals has many business advantages over the small producer. He can produce his metal cheaper and sell it for more. He can sell it when the small producer is unable to sell. Small lead miners have found these facts out lately. Big prices, as well as low costs, have been made for the big producers, not for the little ones. With the miners of free-milling gold-bearing quartz there is no such penalty attached to being a small producer and having a little mine. It is rather the other way.

THE completion of the Trans-Siberian Railroad opens up Siberia and central Asia to the introduc-

The Humphreys Concentrating Mill, Creede, Colo.—(See Page 218.)

tion of American machinery, and, to a lesser extent, the American methods which make it effective. Trade in the former will extend more rapidly than the commercial output from the latter. The road is hardly complete, yet it is shown from the latest reports that Lake Baikal is still being ferried. This in no way, however, interferes with the use of the line as a railroad. It is, however, surprising to learn that the Trans-Manchurian line, which was reported so extensively destroyed by the Chinese, has been restored and the gap in it closed. Later reports do not make such roseate statements about the completion, even though the officials have congratulated themselves and the Czar. Travelers say the line is far from complete, that many bridges remain to be constructed across the large rivers, and also many minor gaps exist beside the great one of Lake Baikal. The absence of bridges will be less of a disadvantage in winter than in summer. Once frozen, the Siberian Railroad practice is to lay rails on the ice and move the rolling stock on them. This device has been applied during the construction to advance locomotives and cars, so as to have their assistance for construction during the summer. Two entire divisions of the road, between the Obi river and Krasnoyarsk, on the Yenisei river, and between the latter stream and Irkutsk, on the Angara river, were commercially operated by this means for several years before the bridges were completed. One difficulty of construction that is retarding completion is the roadbed over swampy ground. In winter, with the swamp frozen, the roadbed holds up, but in summer it is subject to considerable and uneven subsidence under the weight of roadbed filling and jarring of the trains. The minor bridging is largely cribwork and trestle construction made of the light native timber unseasoned and without the sap wood removed. Many of these constructions have rotted and required replacement within three years of their building. The same criticism applies to the ties which are largely made by splitting in half 8-inch diameter fir trees with the bark removed. In the first built sections these were again spaced too far apart. Contrasted with the later American standard railroad construction, the Trans-Siberian road is rather below it.

## Fraudulent Siberian Mining Schemes.

Conscienceless promoters are again coming into sight with attractive looking propositions for miners and others to go to Siberia with the opening of navigation next spring. The attractiveness of such propositions is entirely in their looks on paper. The promoters are utterly unable to realize any of the things they promise to the people who will discover after they are separated from their money that they have been swindled.

These fellows with their Siberian schemes do not go to capital with them, as they could if they really had the merit they advertise behind them, but seek for their victims people who have by self-denial and deprivation saved up a few hundred dollars. This they speciously ask for as payment for transportation to the Siberian gold mines.

The facts regarding Siberian mining enterprises are not at all what these promoters represent. In the first place, only Russian subjects can get mining claims at all. After the discovery it takes two years or more to get an authorization to mine the discovery. A miner is not allowed to explore and mine at will on the State domain. A Russian mining enterprise may have a foreign owner in it, but it must be managed by the Russian owner. The Government demands a royalty of the gross placer gold and the miner must send the gold to Irkutsk, no matter how distant, and it is there paid for in Russian paper money. The export of gold is prohibited by law under severe penalties. Such an arrangement as a "lay" or mining partnership of the Alaska kind is impossible in Siberia. The gold cannot after mining be directly divided, the miner taking his share and the owner his. Russians who have good gold placers in Siberia do not take foreign partners. What are known as "concessions" for the mining of a large territory are not given till the cream of the ground has been worked out.

The mere statement of these Russian mining laws should be sufficient to condemn without reservation the schemes of promoters who ask American dollars from poor people for their pretended Siberian mines. No one but the Czar can alter a Russian mining regulation, and no alteration has been made in these regulations as a result of the discovery of gold in other countries.

No one under any consideration should accept the proposition of these dishonest promoters or give them a dollar. They have absolutely nothing to give in return for it.

Gold mining is hard enough in our own far north land. The natural difficulties are extreme and make the cost of gold high even with the richest deposits.

The legal difficulties that owners of claims have in holding them are by no means light, as the history of mine litigation at Nome shows. But all these physical and political difficulties are relatively insignificant as contrasted with what foreign miners must contend with in Siberia.

## The Lead Miners' Meeting.

Lead mining is at the present time suffering from the effect of a production exceeding consumption, aggravated by the effect of a high sale price, which has induced the starting up of many new producers. The remedy that is suggested most generally is the restriction of production by an agreement between producers. The American Smelting & Refining Co. favors this method, one of the officers, however, stating that it is entirely an affair that the miners must settle, as the smelting interests are only concerned indirectly as the buyers of lead ores based on the market price, whatever it may be. The business advantages of a steadily maintained price are set forth to support the necessity for making the agreement. The condition of the lead mining industry before the establishment of the present price, when lead miners were keeping prices low through competition in selling, is referred to as the bad example of what will happen if the miners do not limit production by agreement.

One fact may be accepted to begin with. There is more lead being produced than consumed. A second fact would appear to be fairly well established. The excess amount of production is the result of increase in production outpacing the increase in consumption. A presumption, which may not prove to be a fact, is that a reduction in price will not increase consumption and thus bring it up to production again. Present uses of lead seem to be independent of the present price. They are not diminished in amount by the price being high. They would not likely be increased if the price was lowered. It cannot, however, be said in this industrial age that with a lower price there will not be new uses invented for the metal.

The American Smelting & Refining Co. is not making the same statements that it did when it was organized. Then the story of the managers was that by monopolizing the smelting and refining they could maintain the existing high price indefinitely and that the miners would have a sure market for their ores. Nothing but the monopoly has materialized. They admit they cannot hold up the price beyond the life of their existing contracts. They have not furnished a sure market for the miners' ores. Smelter charges, however, have been maintained despite the economies made in their operation. So far as the lead miner is concerned the combination of the smelting and refining business has been a failure. Will the combination of the mining interests that has been suggested prove any more effective?

It must be taken into account that it is not good business to produce more lead than is consumed. It is simply loading the cost of production with interest on that cost, and abnormal commercial conditions, that cannot be safely anticipated, would be the only possible chance of the disposal of the surplus. The reasonable view would be that it would continue to accumulate until it broke down the carrying capital. There remains, then, only the restriction of production, first, to much less than consumption, until the existing surplus is worked off, and, second, the subsequent limiting of it to the consumption demands.

There are two ways in which production can be restricted: The lowest-grade mines, or mines with the least margin of profit, can be shut down, and the higher-grade mines work up to their full capacity, or all the mines can scale down their output. Either mode is open to the objection that the development of new mines will shut down, or scale down, more of the old ones, who make the first sacrifices. The first mode has special objections arising from two sources: The owners of these low-grade mines, which generally have large, costly installations, as compared with the higher grade mines, would object to having their investments made idle, and the American Smelting & Refining Co., which is in the business for quantity rather than quality, would not be inclined to favor this mode. They make

more from treating two tons of 30% ore than from one ton of 60% ore. This mode of limiting production is the mode taken by competition which eliminates the poorer and weaker, but does it at the cost of losses which are sustained by all. The same result obtained by agreement saves these losses.

The other method of restriction, by limiting arbitrarily the amount each mine can produce toward the total, is open to the objection that it reduces the economy of operation of all the mines, and some of them below the profit margin point.

Directly or indirectly, the price of overproduction in lessened profits must be paid. If prices are kept up, the profit on the consumption must be diminished by uneconomical costs which are incurred.

Looking at the situation from this end backward, the artificial lifting of the price seems to have brought permanent disabilities to the lead mining industry that more than counterbalance the first profits. New operations were initiated handling large bodies of low value ores, which operations, going now, must continue to go if they only pay costs. The smelting combination gives them a preference as against the smaller mines producing lesser quantities of high-grade ore, which they penalize by higher treatment charges.

As matters are at present, while what to do is debatable, the chances favor something happening. The miners will fail to make an agreement to shut down some mines entirely and will be unable to agree on the respective shares of the losses of economy that will come from scaling down all the mines. The scaling down would have to be to about half. The Coeur d'Alene mines have been restricted a quarter to a third, and the Leadville, Colo., mines even more, yet the surplus has continued to accumulate. What will happen most likely will be that the price will get away from the controlling power that holds it up now and will drop quite low and be anybody's to make and hold. It will be a violent remedy, but the chance of having to try it is so near that lead miners will do well to prepare for it in advance.

## The Latest Gold Manufacturer.

The scene is shifted from the sea islands of the Maine coast. It is now opened in the heart of nature's own gold factory, the Rocky mountains in Colorado. Gold is not to be taken ready made out of the salt sea water this time. It is said that this new discovery makes gold from just nothing at all, grows it from the attenuated mountain atmosphere.

A Professor Wynn is the new magician who is willing to give up his secret and most of the gold he makes if permitted to have the lesser part of the gold. The proposition is being liberally entertained, it is reported, by Denver farmers whose crop of rocks it threatens to make valueless. One railroad manager is reported to be absorbed in the proposition and another man is reported to have left the scene of a test with a significant smile.

Somewhat in the lines of early education in mining, the professor doesn't get anything by fire assay, but does extravagantly well with his own test. His recovery is still weak, however. His own tests show very much more escaping him in the tailings than he recovers. His explanation is that it grew—it may be like yeast—from the start his process gave the rocks.

Naturally, the professor is reticent about his process. He has no gold brick ready for sale yet. The professor is already talking of restraining the output so as not to break the gold market. This is, of course, consideration on his part that the owners of gold mines in Colorado and elsewhere will undoubtedly appreciate.

THE market for silver has now in sight the renewal of purchases by the United States Treasury. At the present time there is in the Treasury available for coinage only about \$42,000,000 of the stock purchased under the Act of 1890. Under this Act the Treasury bought 168,674,682 ounces for coinage, paying out for it \$155,931,000. This has been steadily drawn on for coinage, and what is left is going out at the rate of \$22,000,000 annually. In two years none of this old stock will remain, and before that time the Treasury should be a purchaser again. Congress will, however, have to pass a new Act authorizing the purchase of silver.

## Concentrates.

MONAZITE is valuable only for the thorium it contains in the form of phosphate. The use of the thorium is in making Welsbach mantels.

THE nickel-copper matte obtained at Sudbury, Ontario, contains about two ounces of platinum and an ounce and a half of palladium to the ton of matte.

THE siphon process will not work to a greater depth than 28 feet 4 inches at an altitude of 60 to 200 feet. Any pipe laid or time spent to a greater depth will prove a loss.

THE presence of lime in drinking water can be determined by putting a couple of drops of oxalic acid into a glassful of the water and blowing on it. If it turns milky, lime is present.

THE value of any thing taken can not be regarded as enhanced by the taking. The value of that taken must be determined by the use which the owner could make of it for his own purposes.

THE diameters of pipes refer to the interior diameter. The diameter of casing is the outside diameter. Casing has special threading and special fittings that are not interchangeable with pipe fittings.

LATE mill construction practice provides about 3 H. P. in the power plant for each stamp head, the excess over that used by the stamps moving the rock breakers, concentrators and other mill machinery.

THE term "cable" is correctly applied to any heavy rope or chain designed to sustain great strain. Whether it be flat or round, made of steel or hemp, used on land or sea, it is a "cable" when used in the manner indicated.

THE Supreme Court of Utah in the case of Crouch, Weldon et al vs. J. Welsh and the Huntsman M. Co., decided that lessees on mining claims may remove buildings and other mining improvements that they have put on them.

AN aperture 12 inches high by 12½ inches wide, cut through a 1½-inch plank, with 6 inches depth of water over the top edge of the opening, will discharge 200 miner's inches of water—a small fraction less than 300 cubic feet a minute.

THE Mont Cenis tunnel, in the Alps, was driven at the rate of 18 feet a day at a cost of \$373 per foot. The St. Gotthard tunnel was driven 30 feet a day at a cost of \$237 per foot. The Arlberg tunnel was driven 36 feet a day at a cost of \$178 per foot.

ARSENIC is not produced commercially in the United States. This country imports from 5,000,000 to 7,000,000 pounds annually. White arsenic wholesales in New York at 4 cents per pound; red from 7 to 8 cents. San Francisco prices are slightly higher.

THE Idaho Supreme Court has made a decision to the effect that a notice of location which fails to tie the claim to a permanent landmark is void. The decision is said to have an effect on the validity of a large number of claims which were supposed to be located properly.

THE installation of a water power plant is more costly, as a rule, than the installation of a steam plant of the same horse power. The rule does not always apply, particularly on the Pacific coast, where it is possible to get high heads of water. The cost of operation is almost invariably lower with the water power plant.

THE temperature of the cyanide solution influences the solution of the gold. A temperature from 90° F. to 100° F. seems to accelerate and increase the amount of the solution. In working in winter the temperature of the cyanide room and of the solutions should be kept up to keep the solution at its highest efficiency and to prevent freezing.

A COMMONLY EMPLOYED VELOCITY of flow for water in a pump drive pipe or water column is 8 to 10 feet per second. The diameter of the pipe is calculated from the quantity of water to be delivered per second by the pump. The simplest way to ascertain these elements is to consult the graphic table that appears on page 215 of this number.

IN the U. S. Circuit Court of Appeals at San Francisco a decision has been rendered in the scrippers oil case, confirming the decision of the lower court, which decided that scrippers could not locate on oil lands, thereby ousting bona fide mineral claimants. One of the Justices dissented. The case, it is said, will be appealed to the Supreme Court.

IN the case of Tyrrell vs. Cooley, in Nevada county, Cal., the court held that the railroad patent under which the latter claimed title was erroneously granted, the land being well known mineral land, including the Lincoln mine, at the date of the grant. The decision which gave title to the land to the plaintiff, gave the defendant the right to cut and remove the timber from the surface.

HOT compressed air is said to have been used with success to start a petroleum well flowing, after steam and compressed air at atmosphere temperature had failed. The failure of the latter was probably due to its cooling under expansion after leaving the air pipe, thus tending to freeze the petroleum in immediate contact with it. The hot compressed air expanding did not cool down to a temperature which would tend to solidify the petroleum, but, possessing an excess over atmosphere tem-

perature after expanding, it softened the petroleum so that it would flow.

EXPERIENCE with tunnels driven under the sea or lakes has tended to sustain the opinion that the sea ooze and fine silts settling in undisturbed water have so caulked up the crevices and seams that the danger of water breaking in while excavating is not particularly to be feared. Where explosives are used the tunnel cutting should be well below the bottom of the water, so that the seams are not opened up.

THE gold in the Shasta county, Cal., granite that did not make a mine, though it made quite an excitement on discovery, was in all probability deposited as a replacement by precipitation from surface or spring water having gold in solution. The deposit was quite shallow—2 or 3 feet—and only a few feet wide. Its length was 200 or 300 feet, and the surface had the appearance of being an old water channel.

AS TO the action of lime on quicksilver, a solution of lime will clean it and accelerate action. The amount to be used and the strength of the solution must be largely governed by the amount of impurity in the quicksilver. Regarding the loss of quicksilver in mills, the average loss is about one-tenth of an ounce per ton of ore milled, although in many cases the loss is a great deal more. It varies, according to the character of the ore.

THE discoverer, owner or operator of a mining claim to which he has a U. S. patent has a right to follow the dip of the vein under agricultural timber land, if his is the senior title—that is, if his patent antedates the patent or possessory right of the adjoining agricultural or timber land; but if the patent or possessory right to the agricultural or timber land is of a date preceding that of the mining claim, the owner of the latter has not such right.

TUNNELS to cut a ledge bearing copper sulphide ores at great depths below the upper mine openings are not good mining practice. Experience has shown that the copper sulphides frequently occur in lense-like masses in the main body of iron sulphides, and that these lenses are richer and more extensive near the surface. A tunnel run to open up such deposits at great depth has too many chances against the copper being there to justify the risk.

FIFTEEN test cases brought by the Coal Owners' Association of England against individual leaders of the miners' organization for the action of the unions in stopping work in the mines to keep up the price of coal, and consequently of wages, based on a sliding scale agreement, have been decided by awarding small damages to the employers. The court held that workmen, though giving notice of intention, have no right to stop work with the object of restricting production.

THE cost per cubic yard by hydraulic mining at the North Bloomfield, Cal., mine was 6.25 cents. Some hydraulic mines, notably those at Dutch Flat, Cal., and on the Klamath river, have paid dividends from mining that only yielded at the rate of 3 cents a cubic yard. The limits of past results are so far apart that averages from them are not a guide to conclusions. A proposed hydraulic mining operation must be estimated on very much as if it was the first to be undertaken.

THE size of track rail to be used in a mine is not an arbitrary matter. A T-rail lighter than twelve pounds to the yard is not, however, advisable. A weight of over thirty pounds to the yard is not necessary unless using large locomotives and heavy carloads. In the drifts of a copper mine where there is much mine water it may be profitable in the long run not to use T-rail at all. For the track in such mines a wooden rail with a flat iron strap may be the preferable construction.

RIVER MINING CLAIMS for dredging where the banks of the stream have been meandered in the United States public land survey are not on public land of the United States, and the requirement of the United States mining laws would not apply. This at least would seem to be the deduction from the commissioner's ruling in the case of some Rogue River, Or., river claims, which were refused consideration by him and the applicants referred to the State of Oregon as having jurisdiction.

THERE is no law in California, nor in any other State, known to "Concentrates" requiring the underground openings of a mine to be surveyed and platted and filed in a public office. Some European countries have such laws. In Russia surface placer workings for gold and platinum are all platted in advance of opening and filed. A government record of each mine is kept, going into such minute details as the location of piles of overburden removed to get at the gold-bearing ground, and of the piles of washed tailings.

THE rate allowed for time expended in doing the \$100 annual assessment work on a mining claim, as decided by the courts before whom the question has come, is the common rate of miners' wages in the district. In California the courts have said \$3 a day is the rate. In other States there have been other rates established. A court recently took into account, in fixing the amount of work done, the special difficulties in the particular case before it, and made an allowance for the cost of packing in supplies, holding that it was money expended in work.

ASSAYING can be done somewhat more cheaply now than a dozen years ago, using power devices that save hand labor and with furnaces and other devices that save time by doing more assays in the same time; not necessarily doing a single assay in a shorter period of

time, but the elements of care, skill and knowledge that the assayer employs have increased rather than lessened. An assayer's charge for his work is more to be questioned if very low than if it seems high. The assayer is entitled to pay for what he knows, as well as for the physical work he does and the material he uses up.

FOR very long railway tunnels where great difficulties are encountered in securing ventilation during construction and subsequent operation, the preferable construction would seem to be to make two parallel tunnels, connecting them at short distances apart by cross gangways. The one of the two to be used as the air conduit for the other can be made in the same dimensions as the heading or leader cut of the railway tunnel unless a double track line is planned. In this case each of the tunnels is built to take one of the lines.

A HYDRAULIC MINING PLANT is being used to fill in tide lands at Seattle. The ground hydraulicked consists of city property, which it is desired to grade down. Water is pumped from Lake Washington to a reservoir at the top of Beacon Hill. From the reservoir it is conducted in a 30-inch main 4500 feet long, thence in two 18-inch branches, one to a giant and the other to feed the ground sluices. The piping will be done with 220 feet head. The ground hydraulicked is sand and light gravel, which washes readily. Sluice boxes on trestle bents distribute the filling over the flats. The capacity of the plant is about 50,000 cubic yards daily.

DEATH VALLEY, in Inyo Co., Cal., contains a large number of mineral deposits that will ultimately be commercially utilized. These include borax, salt and nitrate of soda. There is one bed of salt over which the old road from Mohave to the borax works is built that is 5 miles across. Borax exists in beds in old marshes and in deposits of colemanite in the bordering hills. The nitrates are in the bordering hills. The valley has one fair-sized living stream, Furnace creek, which provides water for the old borax works and to irrigate twenty acres of alfalfa, from which a cutting was made every month. Trees, except mesquite, could not be made to grow, the fierce heat destroying them.

A DRIFT is a term generally inclusive of all horizontal mine openings. In a more restricted but common use it is a horizontal mine opening of dimensions convenient for working out the rock and for use for transportation or travel after completion. Where it has its start at a station it is termed a level; if at about right angles to the trend of the ore body it is called a crosscut; if outside of but parallel to the trend it is sometimes called a gallery. Working horizontally in the ore body wider than a track and passageway, as in a drift placer mine, the entire opening would be called a drift; the face of rock, ore or gravel being mined would be a breast, and the track and manway opening through the drift would be a gangway.

IN the Calaveras county, Cal., case the trial court decided that a placer location was valid even if the requirement that it should be a legal subdivision of the public land survey was not followed. The decision has been appealed from. Department rulings on the requirement have not been uniform. In one case, where the Department at first refused to issue the patent, by reason of the non-conformity with this requirement, it subsequently, on a second rehearing of an appeal, allowed the patent, giving as a reason the appearance on the deputy mineral surveyor's plat of a corner of an unsurveyed claim which would prevent the full appropriation of the legal subdivisions of land that should have been designated in the application.

IN providing power for pumping water through a line of pipe, provision must be made for power to balance the friction head for the discharge, the velocity head, and the entry head, as well as the head due to the difference of elevation between the inlet and the discharge expressed in another form. The total head to be overcome by the power would be the sum of the entry, velocity and friction heads of the same quantity of discharge from the pipe, with the direction of flow reversed, plus the difference of level between the inlet and discharge. Only the last seems to be considered in most of the discussions on mine pumping. The three heads noted have a variable sum, dependent on the elements of the pipe through which the pumping is effected. A corresponding variable amount of power is required to overcome these variable heads. The practice seems to be to charge this power as a loss of efficiency in the pumping engine. Really this head should be credited to the pumping engine as part of the work it is doing. With this correction made, the percentage efficiencies of many pumping engines would make a much more creditable showing. How considerable this additional power required may be is illustrated by this problem: What effective power is required to deliver by pumping 30,000 gallons of water in twenty-four hours through a riveted sheet iron pipe 4 feet in diameter to an elevation of 500 feet? The velocity of flow required to make the delivery is 4 feet per second. The entry head for this velocity is .125 foot, the velocity head is .25 foot, and the friction head—by Weisbach's formula .1437 foot per 100 feet—is 49.5 feet for the total length of the pipe. The sum of these is 50 feet, to which the difference of elevation—500 feet—added makes 550 feet of head against which the water must be lifted by the pump. The amount of water to be lifted per minute is 173,750 pounds, which for 550 feet amounts to 95,562,500 foot pounds. This divided by 33,000 gives 2895 H. P. of work, for which, at 70% engine efficiency, there is required in the engine 4135 H. P. effective.

## Deliveries.

Written for the MINING AND SCIENTIFIC PRESS by C. H. FITCH.

I would like to give your readers a heart-to-heart talk on deliveries, because I think it will make for good.

Most of the grief in this world comes from expectations which are lifted unduly high only to be dashed to the ground. Philosophy tries to remedy this weak indulgence of human nature. We are told that "Hope tells a flattering tale, delusive, vain and hollow, but let not hope prevail lest disappointment follow." But hope for the moment is too sweet a thing to be slighted, and we allow it to take the very front place in the procession, whatever devils may "take the hindmost." Again, we are told that, if we can not have our desires long, we have our remedy by cutting them short—a cruel process of vivisection, however, when they have grown to be part of our ideal selves.

But where philosophy proves futile, the drill of education proves beneficial. Men are notably children of larger growth. A bawling baby, a snarling or ugly boy, a peevish or cynical man, are not quite the same as a crowing baby, a brave and amiable lad or a man of large and generous motives. An important determining cause which throws a person into one or the other of the above classes is educational drill. If the drill is bad, it is a course in lying and false expectation. The habit is formed of claiming too much in everything and being habitually called down in mortification, so that the person's experience becomes that of one who looks out of too large a self-esteem into an always ensmallled and belittled appreciation by others. Early flattery, the indulgence of weak mothers and an easy yielding to mean and whining methods of gettings things are bad drill.

But good drill is true and prompt. Its word can not be swerved, and, if the word is insufficient, a whack of punishment follows immediately. It begins with low pay and hard knocks and inflated self-consequence to have the wind taken out of. So the man gets a habit of working hard for better results, and when a little appreciation comes it is very sweet and causes him to redouble his exertions. After that the future always seems to expand close before him; he is called up, instead of down, and, if he should be rebuffed, he has got a liking for the game of going up against difficulties, and pushes all the harder in the modest and good-natured persistency in which he has been drilled.

Three steps in the business of marketing mining machinery are inquiries, orders and deliveries. Inquiries are fished for at considerable expense. They cost several dollars apiece even when obtained by advertising in the best available papers. In others they cost \$30 or \$40, and in some cases \$300 or \$400 are spent without getting a single traceable inquiry. At these prices an inquiry should be held precious; but we are criticised for not giving them better attention. This is because many of them are not in our direct line, or do not mean business. In fishing for black bass we find shoals of little fish called "conners," which do nothing but take the bait off the hook.

Having happily got a good inquiry—a good nibble—we are on the alert with every instinct of the ardent fisherman to land an order. Ex-President Cleveland may make his best apology for the Waltonian pastime, but fishing for business needs no apology. It is easily ahead of the frivolous sport of torturing the lower creatures and dragging them out of the element in which the good Lord placed them. Fishing for business is more earnest, more absorbing. Rightly done, if I may continue the analogy, it conveys a blessing upon the fish, and leaves him in the swim.

Our anxiety to get orders leads us to take very sanguine views of deliveries. We go on the wrong principle of education both for ourselves and our customers, and are so frequently found liars that it comes to be regarded as a bad matter of course. It is a hard, slow way of getting business to tell a man you will ship his mill in six months, when a competitor stands ready to promise shipment in thirty days, get some of the customer's money, and then stand him off seven months with narratives about strikes and breakdowns.

I hold the customer to be responsible, with the manufacturer, for this state of morals. He wants so much for his money, quick and easy, and so underestimates the expense, time and difficulty of putting a mine on a paying footing, that it is in some cases impossible to do business with him on the basis of true values and representations. There is the large end first, the roseate prospectus, the fortune to be picked up off the ground, then comes the chill of assessments and hope deferred, and the looking toward small and disappointing realities. In this frame of mind everything goes wrong, and there is a strong temptation to unload the anxiety by dishonest means.

Yet to a sane, educated investor all may be right. He knows what to expect—that it takes time and money to develop a mine. Things are coming along as rapidly as could be expected. He has taken the time and expense to prove that he has something

more than a dream mine, and that the dividends are only a matter of steady work and patience. For him there is no gall or disappointment about it.

Some may possibly say that this moralizing about deliveries is useless and impracticable, that people are, like Barnum's patrons, wanting to be fooled, and continuing to insist on unreasonable expectations and miserable consequences. I do not agree with this. Many an investor, indulging in too sanguine expectations, has the sense to read this paper, reflect upon what he reads and make safe his judgment. Good morals are stronger than steel. Wherever there is a great industrial success, there are good morals, and where we see the rusting machinery, the deserted shaft house and the dismantled mill, we see, as plain as the printed page, a history of departure from honest realities. Let us be more exact in our expectations, for a man with a false hope is looking to the bad.

A manufacturer's chief concern is to keep his shop busy. He would sooner be overcrowded with orders and keeping his customers waiting than short of orders and letting his men go. This makes him over-anxious to clinch a good order by sanguine promise of delivery. We may have to make some concession to moral imperfection. The other evening I bought a basket of fruit of a vendor and found large, ripe peaches on top and small, green peaches at the bottom. Next morning I called him to account, starting in with the inquiry:

"Do you call yourselves honest and reliable people here?"

The old man eyed me cautiously and answered: "Only moderately so."

There is one thing more that can be done about deliveries beside the endeavor to "moderate" our lack of virtue. That is to anticipate our wants, have foresight and get our orders in early. It is just as easy for a mine manager to ask himself: "What will I need in March, 1902?" as it is to ask himself: "What do I need now?" This is not a little thing. It is a point in good morals running through the entire industrial series. The manufacturer will then have his facilities ready in time, his supplies and materials purchased, his men assured of employment, and can give reliable promise of delivery.

Another point I make is that of co-operation. This foresight on the part of each mine manager will not only best serve his own immediate purposes, but will put the whole country in better running condition. Why ignore such a point as this, when it is precisely such co-operation that makes the United States more prosperous and wealthy than, for example, Madagascar?

## The Second Turbine Wheel Pit at Niagara Falls.

The second wheel pit of the Niagara Falls Power Co. at Niagara, N. Y., has a length of 463 feet 8 inches, a depth of 173½ feet, and it is 18½ feet wide. The tunnel extension to the new wheel pit has been excavated, brick-lined from end to end, and connection between the brick lining and the tunnel and the pit has been made. Many of the castings for girders, streets, etc., have already been placed in the walls.

In the construction of the second pit the engineers are said to have met the same conditions of rock and water that were found in the first pit. From the top to the bottom the nature of the rock changes four times. The inflow of water through seams in the rock was practically the same as was met in the first pit. This water was caught in a "ring" 60 feet down and then pumped to the surface. This "ring" is practically a reservoir excavated in the sides of the pit. Into it flows all the water that comes through the rocks above. When the pit is completed and the installation placed, the water that flows into the "ring" will be conducted to a point below the turbine deck, and there pass into the tunnel, and through it to the lower river. In the new pit, as well as in the old, care has been taken to see that the pit is fully drained. The pit is to be lined with brick from top to bottom, the rear course hollow in order that inflowing water may be caught and conducted to the tunnel.

The tunnel extension of the new wheel pit is nearly 700 feet long, and runs in a curve from pit No. 1 to pit No. 2. It is of the same size and shape as the original tunnel, which is that of a horseshoe. It has been lined with brick, the first eight courses and the inverts being of vitrified brick, and the other portions of what is known on the work as "tunnel hards."

Six chambers have been excavated in the west side of the new pit. Each of these chambers is 18 feet wide, 21 feet high and 50 feet deep. It is probable that oil and air pumps will be installed in them, and also the exciters for the mammoth dynamos that will be operated in the power house. The chambers are 138 feet below the surface.

The capacity of the station will be 55,000 H. P., made up of eleven units of 5000 H. P. each. The turbines in the original pit are of the twin type, while those in the new pit will be single wheels of the inward discharge type working under a head of 145 feet. The turbines in the original pit work under a head of 136 feet.

The forebay, which will be covered, will be 460 feet long and 40 feet wide. Its outer wall runs along the inlet canal, and in order that the water of this canal may pass into the forebay twenty-four arches have

been built, the top line of which is under water. Back about 10 feet from the arches are the racks. The outer wall of the forebay is expected to keep back the floating ice in the inlet canal, while the fact that the forebay is covered, will be a protection to the men employed there, and also from the severe weather of winter time.—Electricity.

## The Electrical Burner for Blast Furnaces.\*

By F. L. GRAMMER.

In these days, when anthracite is less extensively used as a blast-furnace fuel than it was a generation ago, and managers endeavor to maintain regular and known ore mixtures, the "freezing" of tuyeres, cinder notch or iron notch is infrequent, and, consequently, the oil burner or "kerosene blowpipe" is seldom employed, and furnace foremen have, to a considerable degree, forgotten their former cunning and persistency in the use of the drill and sledge. Still, in starting new or abandoned plants with untrained labor, and in running some of our large 100-foot furnaces, slips, resulting in very cold furnaces, may occur, even under experienced managers.

During my superintendence of the Cleveland, O., blast furnaces, such a misfortune, owing to a dearth of trustworthy foremen, was experienced, and our electrician, Thomas Martin, proposed to open the tuyeres and cinder notch by means of the heat of the electric arc. We have heard that the surface cracks or marks developed in rolling heavy plates have been closed by electric welding, as by a soldering iron, and also that an electric burner has been employed at some German blast furnaces; but the experiment was quite novel to us, and I think it constituted one of the first, if not the very first, successful applications of this device, for the purpose named, in the United States.

In the construction of the circuit we attached one wire to a pipe, feeding a cooling block of the furnace wall, some distance from the point where the burner was applied. The current from this wire passed either through the crucible or through the circumferential shell. The other wire, after running through a resistance coil immersed in a barrel of water, was attached to clamps holding the carbon, the latter being inserted in an iron pipe provided with a wooden handle, and applied at the desired point by the goggled operator.

Our first experiments were not very successful. We used 1.5-inch carbons, 1.5 foot long, not being able at the moment to obtain larger ones. Subsequently, we had carbons made 4 and 6 feet long, and with these we burned a hole through 18 inches of cold iron in five minutes. A current from 400 to 500 amperes did the work; but 1000 amperes (at 80 volts) gave better results. Our two dynamos were Genere Electric, with 110 K. W. capacity and 220 volts. We reduced the voltage by means of a resistance coil of German silver wire.

The results were so satisfactory that permanent wires were strung up to the furnaces, and "hard holes" at tapping time, requiring slackening of wind, are now an evil of the past.

Water blocks sometimes leak and flood a side of a furnace, closing several tuyeres and causing one-sided working. But, by putting blanks on the peastocks temporarily out of use, the blast can be kept on the furnace while the closed tuyeres are burned open. Several furnaces on the Lake fronts used it successfully, after hearing how it had assisted us.

The electric current employed is not dangerous to the workman, and the apparatus, unlike the oil blowpipe, is always ready for service. It can be applied instantly to a black, cold surface without the need of any blast pressure—a boon which will be appreciated at single stacks, where the freezing of the tuyeres may have made it difficult to get the necessary pressure, by affecting the gas supply to the boiler house.

The saving in oil, worn-out men, drills and time, commends this simple and effective burner as the best.

Plants not equipped electrically can use the power of a neighboring municipality or other works, employing a rotary transformer to obtain the desired current.

Both the holder of the burner and the curious spectators should wear the darkest glasses, such as are worn by heaters, or twelve hours of great suffering will be the penalty.

## Graphic Table, Weisbach's Formula Flow of Water in Pipes.

The graphic table which appears on the opposite page was made by Mr. D. E. Bigelow and published in this paper as prepared by him in the issue of August 24. It has proved so practically useful, and so frequently called for by our subscribers, that it is republished, with some changes in the text which make it even more directly serviceable.

The units of quantities of water flow in common use are gallons per minute and cubic feet per second. Mr. John Richard has changed the cubic feet per minute on the original table into equivalents of gallons per minute, and loss of pressure in pounds per square inch is denominated friction head.

Diagram by D. E. Bigelow, C. E.

## Late Gold Dredging Practice.\*

NUMBER IV.

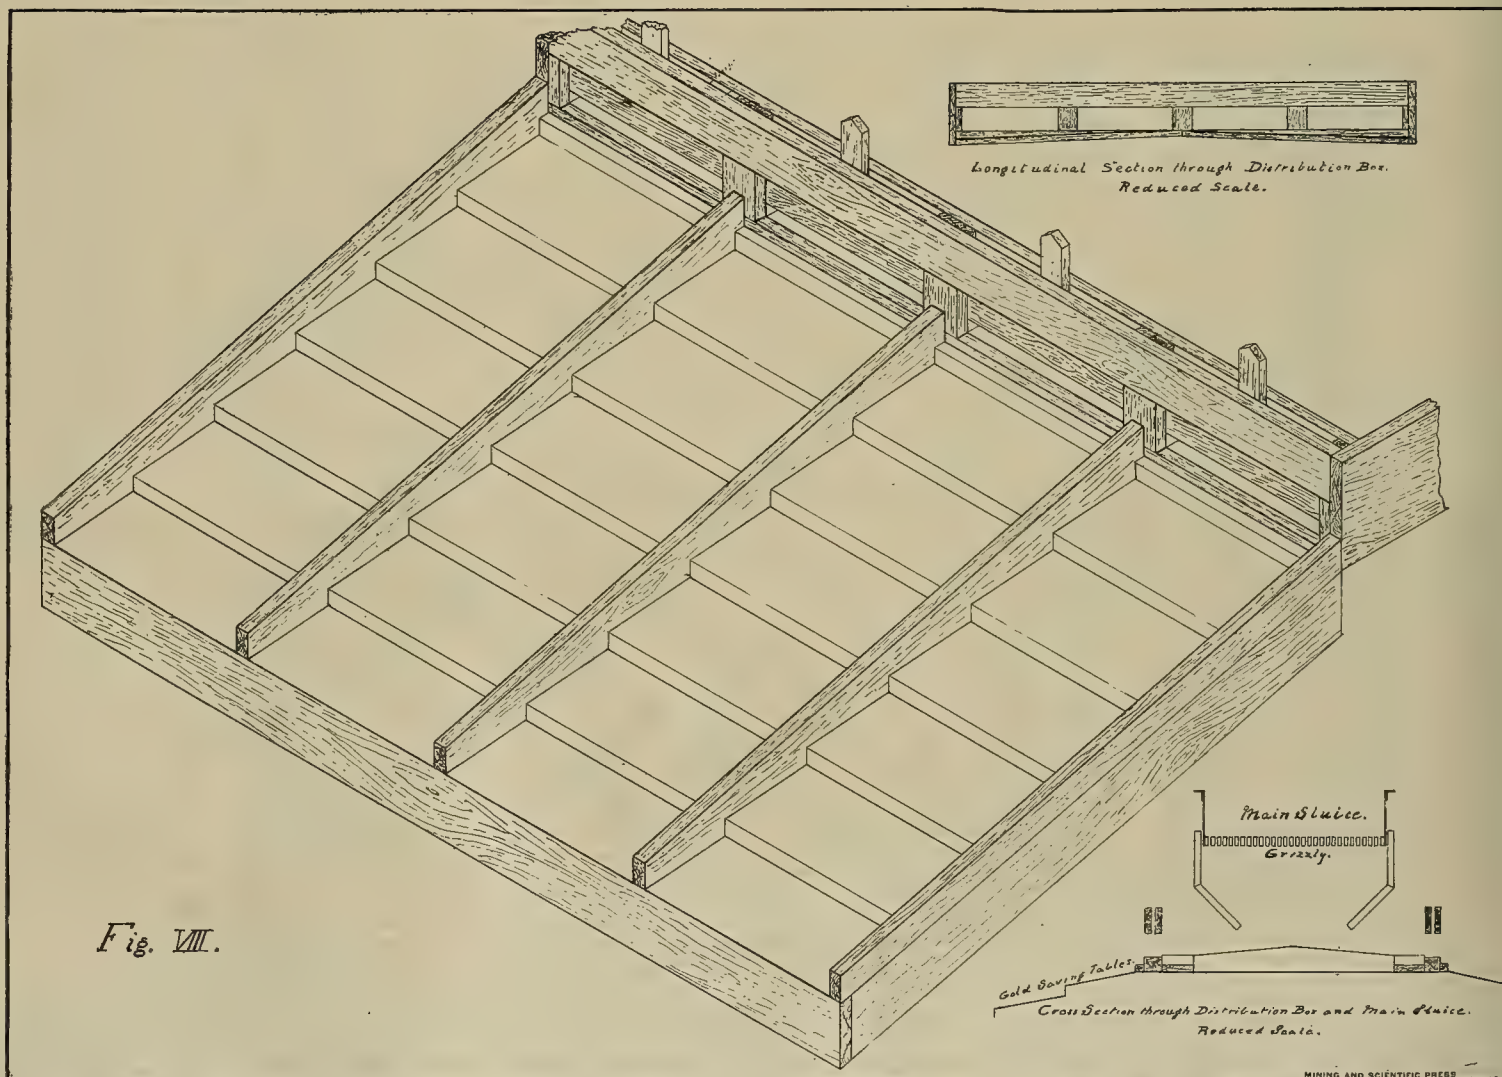

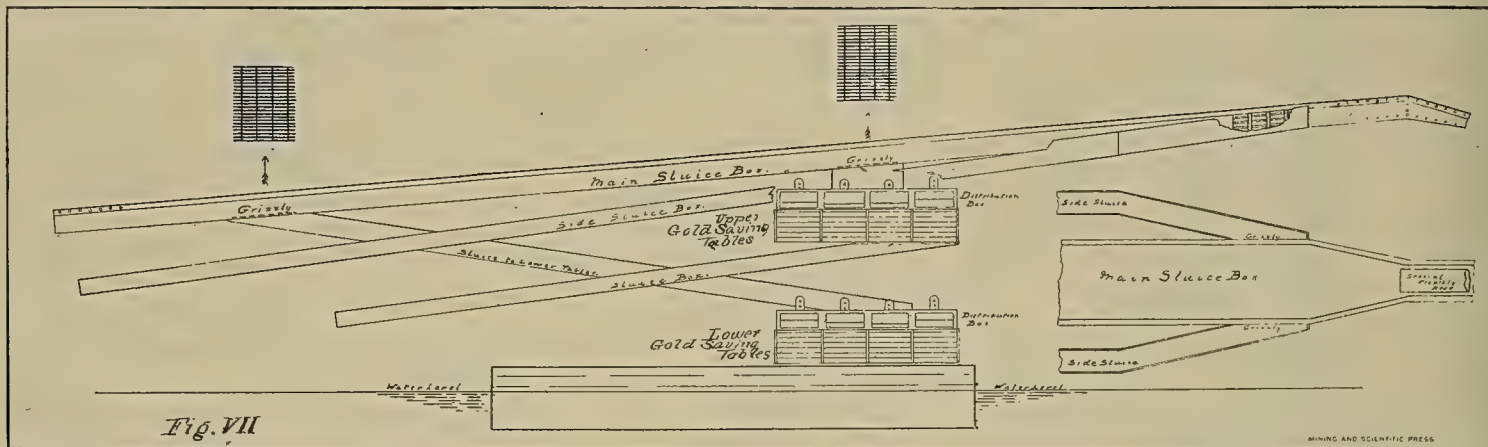

Written for the MINING AND SCIENTIFIC PRESS  
by RALPH L. MONTAGU.

There is another type of dredger that is in operation. This is known as a dipper dredger. (Fig. 6.)

wards fills up the crevices; but where this process is reversed, there is a large volume of hollow spaces between the boulders; therefore the tailing pile is higher in the latter than in the former case, and this necessitates raising the dumping point of the tailings.

The suction dredger has been tried, but was not successful. In this type the ladder and bucket chain were replaced by the suction pipe of a centrifugal

the depth to bedrock averaged 6 feet. The dipper was specially constructed so as to dump into a hopper 14 feet above bedrock. A sluicibox was supported on small flat cars running on a track parallel to the dipper; water was supplied to the sluice through a flexible pipe. The dipper dredger, as used in placer mining, delivers a bucketful (1½ cubic yards or more), and then, after an interval, another bucketful. This requires that there shall either be a considerably greater flow of water to sluice the same amount of material in the same time as the elevator dredgers require—where the gravel is dumped in small quantities continuously—or that there shall be a larger screen area in order to hold back the gravel and feed it steadily on to the tables or sluice and stacker. This fact was thoroughly illustrated in the case to which I have reference. There was sufficient water to sluice, proper provision of screen area being made, but not enough without it to carry off the intermittent amount of gravel dumped by the 1½-cubic-yard dipper, the sluice box continuously choking up. The lower end of the sluice box was, if anything, rather below than above the level of the ground, and, as the wash more than fills the space from which it is

The gravel is dug by the dipper, which dumps into a shaking screen. The fine material is carried over a series of tables and finally deposited by means of a sand pump; the coarse material is conveyed aft and stacked in the manner shown.

The tailings in this case and in the preceding one take up more space than in the two first-mentioned types, because where the coarse boulders are put on the bottom, the fine material being deposited after-

pump, which discharged into a sluice box. Boulders caused a lot of trouble; only a small percentage of the gold in the gravel was elevated, and the dredger was changed into the elevator type (Fig. 1) and then handled the ground successfully.

A dipper dredger, to work on bedrock, was installed in Wyoming, but was not successful, because, so the manager reported, "there was not sufficient water or grade to carry off the tailings." In this case

excavated, this caused the tailings to pile up and cause trouble.

Other conditions being the same, it is better to have the dredger floating than to have it resting on bedrock. In the first case there is no track or foundations to be constantly laid ahead; but in the latter this has to be done and adds to the cost of mining.

GOLD SAVING DEVICES.—The most important part

of any mining venture is the successful extraction of the gold contained in the deposit. The specific gravity of gold is much greater than that of gravel or water:

|             | Weight per cubic<br>inch—pound. |
|-------------|---------------------------------|
| Gold.....   | .700                            |
| Gravel..... | .090                            |
| Water.....  | .036                            |

Therefore if a body of gravel is carried by a flow of water down an inclined plane in which there are depressions the gold will settle in these depressions, although the water would carry the gravel over them. In placer mining the inclined plane becomes the sluice box, and the depressions are termed riffles. In a state of nature gold is found in various

accomplish this, for use with dredgers of types 1 and 2, is shown in Fig. 7. When the gravel and water are elevated by the same centrifugal pump it is impossible to regulate the flow of water according to the amount of gravel passing through the sluice. The pump should be run at a speed just high enough to impart a velocity to the water sufficient to lift the gravel. Water discharged from a pipe onto an inclined plane has a tendency to spread in a lateral direction in a certain ratio to the rate of discharge and the angle or grade of the inclined plane. Just below the discharge point a set of grizzly bars are put on the sides of the sluice, and two smaller auxiliary sluices with a heavier grade than the main sluice are fed through these bars. Although the grade in the side sluices is greater than in the main sluice

of side screens lower down in the main sluice and carry the material from them into the side sluices at this point.

If the gold is so light that a high percentage of recovery is not effected by these means, it would be advisable to adopt an arrangement similar to that used by the Risdon Iron Works on their patent gold saving machinery.

(TO BE CONTINUED.)

In a process devised by J. G. Rhodin, of Manchester, England, for manufacturing potassium salts from feldspar, the feldspar is finely ground and mixed with slacked lime and sodium chloride, the mixture being subsequently heated to 900° C. By this means about 85% of the potassium in the feldspar

forms. In some gravel deposits the gold is rounded in form; the particles are like small shot that has been worn into various shapes and sizes. This is termed coarse gold, and this settles readily in any light depression; but in other places the gold is found in very light pieces that may be large but are very thin. Gold of this description will not settle as readily in the depressions or riffles, and consequently the flow of water must be checked. The grade of the inclined plane has to be reduced and the recovery of this class of gold becomes a more difficult problem in proportion to the fineness of the particles.

In places where the gold is coarse and dredgers similar to Figs. 1 and 2 are used, ordinary riffles placed in the sluice box have been found to be all that is necessary. These riffles are made of wood and are protected by strips of Norway iron spiked on to the exposed surfaces to prevent wear (Fig. 10). It is not advisable to screen the gravel finer than 4 inches on dredgers of these types (Figs. 1 and 2), and in localities where the gold is fine additional screens have to be introduced into the sluice box. The fine material from these screens is spread over tables in order to cut down the velocity of the water and to

provide sufficient area for the proper settlement of the gold.

An arrangement of sluices and tables that will box, the velocity of the water is considerably less.

There are two sets of grizzly bars placed in the bottom of the main sluice, and the flow from these points is led to the distribution boxes, having movable gates at the sides in order to regulate the flow evenly over each section of the tables (Fig. 8).

There are riffles placed in the reverse sluice leading from the lower grizzly to the lower tables, and also in the sluices from the upper tables.

Various methods of making the riffles for the tables are shown in Fig. 9.

The choice of these, and likewise the distance the various grizzly bars are apart, must be governed by local conditions.

I have not attempted to show the various supports for tables and sluices. These the engineer can design for himself.

It may be necessary to put in a current spreader in the main sluice opposite the side screens, and, provided gold is not found in the side sluices below a certain point, it might be a good idea to put another set

is extracted in the form of potassium chloride. It is stated that the process is very cheap and is well adapted for commercial purposes. It is proposed to carry out a series of further experiments with the process prior to erecting a factory in Sweden for the manufacture of potassium salts on an extensive scale. Another prominent feature of the process is that the insoluble residue that remains after the potassium and sodium salts have been extracted by water constitutes an excellent material for glass manufacture by the addition of a little sand and alkali.

The following table shows how many miners' inches of water are required to have a certain head of water for a certain size nozzle:

| Head feet. | MINERS' INCHES |        |       |       |       |
|------------|----------------|--------|-------|-------|-------|
|            | 2-in. nozzle   | 2½-in. | 3-in. | 4-in. | 5-in. |
| 100.....   | 80             | 125    | 185   | 325   | 500   |
| 150.....   | 100            | 155    | 225   | 400   | 625   |
| 200.....   | 115            | 180    | 260   | 460   | 715   |
| 250.....   | 130            | 200    | 290   | 515   | 800   |
| 300.....   | 140            | 220    | 320   | 565   | 880   |
| 350.....   | 150            | 240    | 345   | 610   | 950   |
| 400.....   | 160            | 255    | 365   | 650   | 1000  |

FIG. 1.

#### Walla Walla, Wash., Power House.

In the generating station of the Walla Walla, Wash., Gas & Electric Co. is installed the new hydro-electric plant illustrated here. The plant was put in operation May last, and up to the present time has given 24-hour service without interruption. The water is conducted from a near-by stream through a wooden stave pipe line, 5600 feet long and 4 feet in

internal diameter. The water wheel is 27 inches in diameter and is operated under a head of 90 feet. It is direct-connected by a friction clutch to a 300 kilowatt, monocyde generator. The wheel is a McCormick turbine, built by the S. Morgan Smith Co. of York, Pa., which furnished the hydraulic equipment. The electrical installation was made by the General Electric Co. Fig. 1 well shows the general arrangement of the power machinery. The generator is of the revolving-field type and is operated at 450 revolutions per minute. The end thrust of the wheel is

FIG. 2.

taken care of by lignum-vitae stops, one set in the wheel case and the other in the discharge pipe. The wheel is fitted with a Replogle relay governor, as better shown in Fig. 2. At the left end of the driving shaft will be seen a wide-faced pulley, which is connected to the generator by a friction clutch. This is to provide connection for a 400 H. P. steam engine, which is not shown in illustration. The engine is installed only as auxiliary, to be used in case of accident to the water power. The plant is situated 5 miles from center of distribution.

## Notes on Portuguese East Africa.

Written for the MINING AND SCIENTIFIC PRESS.

This is the country lying to the east of Rhodesia and the Transvaal, and the gold region lies 18° S. and 33° E., with Massi Kessi as the center. It is reached by railroad from Beira, a seaport north of Delagoa bay.

Massi Kessi, or more properly Macequece, is situated on the River Munene, some 2500 feet above the sea. The climate is tropical, malarious and very unhealthy. Horses or cattle will not thrive or live. Donkeys imported from Zanzibar are the only animals that thrive and they are very expensive. Some transport is done by oxen, but most of it is done by negroes and their capacity is wonderful. Most of the negroes are well proportioned and heavily muscled; they work well when properly supervised, their ration consisting of two pounds of rice a day, with one one pound of canned beef (from Chicago) a week, and their wages are equivalent to \$5 to \$10 per month.

The natives do some cultivation at their kraals and raise mealies (Indian corn or maize), pumpkins, cucumbers and potatoes.

The native houses are picturesque; they are made conical; built of bamboo, daubed with mud and thatched with grass and reeds, they are cool and shed rain well. Their clothing usually consists of a loin cloth of limbo or calico. All the labor employed is native, with white overseers.

Some 4800 claims of 1 hectare each have been located; about 1000 have been taken up for alluvial and the remaining 3800 for reef working—a total of nearly 10,000 acres.

Workings of more or less important character have been carried on, especially ancient mining of most extensive nature. These workings, as shown by thousands of old shafts, open quarry like, and other workings are known to extend over some 20x15 miles. Some of this work was undoubtedly of Phœnician origin; but in the year 1575 an ordinance of King Sebastao tells the Governor of Sofala that he must see to it that the output of gold from that town shall not decrease—as seems to have happened just then—and that he must take necessary measures to have it increase to what it had been for some ten years previously.

Statistics show that Sofala used to be a shipping point for gold dust, and it must have come from those Macequece gold fields.

A gold piece was found at Inhanga, bearing the date 1580, and is proof of the presence of the Portuguese.

No tools of European make have been discovered, but at the Mudza river, at a depth of 9 feet, a Kafir hoe was discovered, the iron part of which was nearly eaten away by rust. It is believed that when the Portuguese first arrived in East Africa they found the gold industry already established in the country by the Arab traders, or by people from India, and the gold from Manicaland was exported from Sofala.

On the left bank of the Mudza a fort was discovered built on the plain, but close to the mountains, which was evidently destined for the protection of a considerable number of people occupied in the large workings that extend for a radius of some miles. These workings consisted of shafts some 4 feet in diameter and in many places not more than 10 feet apart.

The gravel was hoisted up, carried to the river and probably washed in wooden bowls. Very little attempt at drifting or timbering was made, only the gravel in the immediate vicinity of the bottom of the shaft being removed. In this particular section the ground was fairly honeycombed with these old workings.

The fort referred to was in the form of a parallelogram, some 235x150 yards. The face farthest from the river is built with shales, and about 9 feet in height by 3 feet wide, having a bastion at each corner, built evidently for the use of small cannon, which would indicate that the fort was built by the Portuguese.

Some prospecting work has been instituted on these placers by the Mozambique Company, who hold a charter on this country. The deposit has a depth of from 10 to 20 feet, with 4 or 5 feet of gravel; the top is red loam, bedrock being of talcose schist. Above this deposit a ledge has been discovered, the gold occurring in the schist. Some of the old workings in the reefs or ledges are very interesting, and one shaft on a mine being prospected by an English company was 220 feet deep.

Occasional specimens of native and other forms of copper are found; blende and galena also often occur, while almost everywhere the reef matter is most abundantly mineralized, chiefly with iron pyrites, though sometimes with copper pyrites. Lime is almost entirely absent. Deposits of mica are frequently discovered. Antimony and derivations seem to be practically non-existent, and the quartz is almost everywhere free milling. The gold is very pure.

Developments are being made on the Richmond and Braganza mines by French capital; but, with the ex-

ception of this work, the mines "pegged out" are simply prospects.

The machinery imported has come from England. There is very little serviceable timber, and, owing to the ravages of the white ant, is very little used. Mine timbers are usually imported from America. The food is nearly all canned and imported from England and America.

To sum up the conditions, one may say that mineral exists throughout the region of the Munene, Mudza, Zambusi, Incarra, Chimeza, Revue and Chua rivers, but not in sufficient quantities to cause any excitement.

The climate is very bad. Living is very expensive. The royalty which one has to pay the Mozambique Company is very excessive, and altogether it is a good country to stay away from.

Macequece, Sept. 20.

## Oil Well Drilling With Wire Rope.

The development of oil fields in California last year directed the attention of the American Steel & Wire Co. to the use of wire rope for drilling oil wells. They found experiments of drilling with wire rope had been made in Pennsylvania, but without success. Investigating the reason for failure, they found the lack of spring in wire rope was the principal cause, that experiments had been made with the regular lay of strand the same as used for hoisting purposes, and that no provision was made for the untwisting and recoil of the lay of wire rope when the load of tools was lifted and released.

They claim to overcome the difficulties by a left-hand "short lay" plow steel wire rope, to which they give the name of American steel wire drilling line. The lay in this rope furnishes the required amount of spring for drilling, the left lay automatically turning the tools to the right, keeping the threads tight in the joints of the drilling tools, as all drilling threads are right hand. Their next requirement was a swivel which would hold fast in the right-hand turn and be released in turning to the left, permitting the lay of the rope to spring back into place at the moment the strain or load of tools was released from the rope. They say they have found these requirements in the automatic drilling swivel. They commenced this experimental work early in 1901, and have proceeded slowly, overcoming many difficulties as they arose in the various formations found. They assert that they have overcome every difficulty thus far encountered.

The changing of standard drilling rigs to the use of wire line is a slight expense; the cost of wire line per

speed with wire rope is increased over that of manila, particularly in wells filled with water, owing to the friction of the water on wire line being much less than on manila. In one well cited by the company, 2500 feet depth, 1500 feet of water in the hole, the difference in friction was so great that the drilling proceeded three times as fast as with manila, owing to the increased blow of the tools. In spudding the speed is about the same, but as the hole deepens speed is increased, on account of the quicker action of metal over fiber.

A driller can determine the formation in which tools are working with greater accuracy with his hand on wire line, owing to the vibrations through the metal being more acute than through fiber. The working of the tools is telephoned to the driller through metal to the nerves of the fingers, and then to the brain, with clearness, as soon as the driller's nerves become accustomed to the increased sensitiveness of wave motion through metal.

The American Steel & Wire Co. now have their American steel wire drilling line and automatic drilling swivel, as illustrated, successfully working in the Fullerton and Whittier districts, in the Los Angeles district, in the Coalinga district and in Contra Costa county, Cal.

All drillers who are not using wire line, but who wish to investigate this subject, can get full information by addressing the San Francisco, Cal., or Los Angeles, Cal., office of the American Steel & Wire Co.

## The Humphreys Mill, Creede, Colo.\*

Written for the MINING AND SCIENTIFIC PRESS.

The illustration on the front page is of the Humphreys mill, in process of construction at Creede, Colo., for the Humphreys Tunnel & Mining Co. When completed it will be supplied with ore by electric haulage from this company's properties through the Wooster tunnel. The building when finished will extend 400 feet along the slope of the hill, its height being 200 feet from wheel pit to the top of the crusher floor. The Hendrie & Bolthoff Manufacturing & Supply Co., who designed the plant, are now putting in the machinery, the design and equipment being intended to carry out the most advanced ideas of ore concentration. The construction has been directed by Raymond Whinnerah, formerly at the A. M. & W. mill at Leadville.

The ore is trammed from the ore bin to a grizzly, the oversize from this being handled by a 10x30 crusher. The undersize and the product of the crusher drop into an ore bin, and from this the ore is fed automatically through a sampler into a roughing trommel, thence to two sets of 14x36 crushing rolls. The material is then elevated and passed through two screen lines, each consisting of four 3x6-foot screens. Everything above 16-mesh is handled by four-compartment Hartz jigs. That part of the ore passing through 16-mesh is run to four Bartlett tables. The tailings are reground in three sets of 14x30 rolls, the product being sized by revolving screens, the oversize being elevated by Frenier sand pumps. The pulp is classified in hydraulic sizers and distributed on twelve Wilfley tables. The concentrates from the jigs drop into hoppers underneath the jig floor and are trammed directly from these hoppers into chutes leading to concentrate bins on the railroad track. The tailings from the tables are handled by launders driven by Bolthoff's patent launder head motion. The power for the mill is supplied by water wheels. A 4-foot water wheel with Replogle governor drives the Wilfley tables and electric lighting plant. A special 6-foot wheel drives the heavy crushing machinery. The power from this wheel is transmitted to the different bents by Manila rope drive. The mill is heated throughout by the Sturtevant system, consisting of steam heater, fan and one central galvanized air duct, distributing the heated air to all parts of the mill. The steam for the heater is supplied by a 50 H. P. boiler. The concentrates are conveyed, in the manner set forth, to six bins in the lower end of the mill, and are loaded directly into cars through chutes from these bins.

It is estimated that 20,000 pounds of ½-inch steel laundry lining is used in the mill. All screen jackets have false linings of ½-inch flange steel. All hoppers, spouts and other parts subject to wear are similarly protected. The elevator head and boot are lined with white iron plates 1½ inch thick. All framing throughout the mill is 12x12, 10x12 and 8x10. Ample power and sufficient strength in all transmitting machinery is provided for doubling the capacity of the mill at a later date. All concentrating tables in the mill are provided with expansion pulleys. It is expected that the mill will be in operation by Jan. 1, 1902, with 150 tons daily capacity.

\*See illustration on front page.

Sectional View.

Automatic Drilling Swivel.

foot is less than the cost of manila per foot. Their ½" plow-steel drilling line has a breaking strain of twenty-seven tons. Its wearing quality is asserted to be three times greater than manila. Drilling

THE tunnel for the electric power plant on the Canadian side at Niagara Falls will be 2200 feet long, 19 feet high by 21 feet wide. It will be brick lined throughout. The contract price is said to be over \$500,000, and the work is to be completed by Jan. 1, 1902.

## Mining and Metallurgical Patents.

Patents Issued November 12, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

CRUSHING MILL.—No. 686,364; T. L. Sturtevant, Quincy, and T. J. Sturtevant, Newton, Mass.

A revolving shaft provided with a beater-carrying head, a case inclosing head, a series of pivoted beaters attached to head, a hopper, a grate interposed between hopper and chamber of case in which hammer or beaters rotate, hopper having an upper feeding chute and a lower receiving pocket communicating with chute in which material to be crushed is held in a substantially fixed mass while being subjected to action of beaters so that material may be reduced in receiving pocket by percussive action, and means for changing relative positions of grate and shaft, whereby revolving beaters may be caused to extend more or less into chamber of hopper through bars of grate.

ORE SEPARATOR.—No. 686,263; J. Conley, Denver, Colo.

A cylindrical screen, having an inwardly projecting spiral rib to move the contents of screen in one direction, a conveyor located in proximity to lower side of screen and moving sand in opposite direction, a casing to contain water and having its walls near the screen and conveyor, whereby agitation of conveyor causes sand to pass back into interior of screen, means for removing ore and sand from bottom of casing, and means for passing sand through screen and casing.

ROCK DRILL.—No. 686,444; H. D. Crippen, New York, N. Y., and G. White and G. S. Maxwell, Jersey City, N. J.

A cylindrical case, a motor enclosed therein, integral extensions on each side having ways for drill elements, a drill shell arranged in each extension and movable longitudinally on ways; a ram, bit, mechanism for effecting percussive rotation thereof, main-spring, ram cam and driving cam arranged in each drill shell, variable connections between motor and driving cam; two cranks suitably journaled on rear of case and adjustable each in two positions, connections between both cranks in one position and driving

cams to vary distance between cams, and other connections between both cranks and an electric switch mechanism to turn on current when cams are separated; feed screws suitably supported, and connections between feed screws and their respective drill shells to feed drill elements, connections between each crank in its second position and corresponding feed screw to operate screw, and adjustable connections between cranks whereby each shell may be fed independently, by its own crank or both shells fed together by either crank.

MAGNETIC SEPARATOR.—No. 686,402; T. J. Greenway, East Adelaide, South Australia.

A horizontally revolving plate of magnetic material, electro-magnets so arranged above and below plate that poles of one polarity are opposite those of other polarity and located to magnetize said plate by induction at certain points of its travel, means for feeding material onto portions of plate, and mechanism for driving plate, thereby carrying ore particles along magnetic fields and centrifugally discharging non-magnetic particles from edge of plate at magnetic, and magnetic particles at neutral portions of plate.

MINER'S LAMP.—No. 686,290; M. F. Hammond, Throop, Pa.

A sloping wick tube soldered thereto, a plain flat deflector attachable to tip of tube, and having a corner extending into flame, greater part of deflector being above level of tip of tube.

AMALGAMATOR.—No. 686,300; F. J. Hoyt, Chicago, Ill.

An inclined receptacle containing liquid amalgamating material, a plain smooth-surfaced cylinder in receptacle positively revolved in direction of flow of

ore and having its axis nearer lower than upper edge of receptacle whereby a greater space will be between upper edge and periphery of receptacle for carrying ore into receptacle and spreading it and carrying it out over lower edge of receptacle onto plate below, without lodging in lower edge.

APPARATUS FOR LOCATING METALS, MINERALS, ORES, ETC.—No. 686,632; A. P. McClatchey, Chicago, Ill.

A Wheatstone bridge provided with earth connections, a source of current supply, source of current supply being connected to bridge, a rotatable screw, a resistance conductor arranged in grooves of screw and forming artificial resistance of bridge, an indicating device arranged in bridging circuit of bridge, a movable contact also arranged in bridging circuit and arranged to make contact with resistance conductor, a nut mounted to travel upon screw and carrying conductor, and means for actuating conductor, Wheatstone bridge provided with earth connections.

SUBAQUEOUS MINING MACHINE.—No. 686,467; S. C. Monberg, Leadville, Colo.

A revolvable casing composed of inner and outer shells, a spiral floor connecting shells from end to end and a concave bottom closing lower end of casing, shovels opening into bottom, pockets disposed at intervals in spiral floor, raffle plates covering floor, a discharge way at upper end of casing, a shaft projected through casing, and which supports casing and on which it revolves, a rack bar on upper end of shaft and means to actuate rack bar to lift shaft with casing.

THE Loschwitz, Germany, suspension cable railway has been opened to traffic and is the first of its kind for the conveyance of passengers. It runs from Loschwitz, a village on the banks of the River Elbe, about 5 miles from Dresden, to the top of the Rochwitz Heights. The railway is 820 feet long, and the grade is 32%. The railways are carried by thirty-three hand piers of varying sizes, the tallest being 49 feet. Each car holds fifty passengers and weighs, when occupied, nearly thirteen tons.

## Electric Welding of Pipe.

Written for the MINING AND SCIENTIFIC PRESS.

The electric system of welding affords a very simple and convenient method of making large pipes in the field where they are to be laid. Sites for field shops can be selected at convenient points along the line on which the pipe is to be laid and the iron or steel sheets are distributed to these shops direct from the plate mills. The shop requires for its machine equipment, bending rolls to bend the plates and bands to the required diameter of cylindrical shell form, a welding machine for the longitudinal seam, a portable oil furnace for heating the bands for the transverse joints, and a welding machine for the bands. The electric power can be brought to the shop by a transmission wire from a generator located at a distant water power, or a portable steam engine or gasoline engine and dynamo can be used. All of the machinery is portable and can be taken down, shipped and set up again in a few hours, or it can be moved forward from day to day as the work advances. The power required is merely nominal.

In the manufacture of this pipe the method is as follows: The sheets are rolled into cylinders of the proper diameters. These are placed in the longitudinal seam welding machine and can be either butt welded or with very light metal lap welded. No flux is used nor manipulation other than mechanically clamping the two edges firmly in place and alignment, applying the electric arc in a furnace, which confines the heat to the line of application, and, when the metal is at a welding heat, squeezing or rolling the seam. The ends of the pipe sections are joined together by means of hoops or bands about 3 inches wide. These are heated in the oil furnaces and then shrunk on, being subsequently welded. It is practicable to omit the band and butt weld the sections together in the excavated trench, thus making the pipe a continuous tube, seamless and jointless except for the weld lines, which do not show in the completed work.

The welding heat furnished by the electric arc is preferable to the blacksmith forge heat. There is no opportunity for coke, ash, sulphur or phosphorus to come in contact with the metal when the latter is raised to the welding temperature. The process is purely mechanical, as the electricity has nothing to do with the welding itself. It merely furnishes the heat.

Mortimer E. Cooley, Professor of Mechanics at the University of Michigan at Ann Harbor, made the following series of tests to determine the relative strength of the electric welded joint as compared with the unwelded metal:

A 30-inch cylinder was made of No. 16 gauge steel,

.066 inch thick, the seam being welded by the electric arc. This was cut into ten rings or bands, each 2.5 inches wide. Each of these rings was divided into semicircular halves, one with the weld in the center, the other half of the ring being entirely unwelded metal. The record of the tests was as follows, the two halves of each ring being tested under the same number in order to make a direct comparison:

|        | Unwelded.                     | Welded.    | Remarks.                                         |
|--------|-------------------------------|------------|--------------------------------------------------|
| No. 1  | broke at strain of 7,610 lbs. | 7,325 lbs. | Broke in the weld and along side of its edge.    |
| No. 2  | " " " " 8,800 "               | 6,950 "    | Broke in the weld.                               |
| No. 3  | " " " " 9,200 "               | 7,620 "    | Broke in the solid metal 5 inches from the weld. |
| No. 4  | " " " " 8,763 "               | 8,765 "    | Broke in the solid metal 4 inches from the weld. |
| No. 5  | " " " " 8,665 "               | 8,300 "    | Broke in the weld.                               |
| No. 6  | " " " " 8,635 "               | 8,580 "    | Broke outside of the weld.                       |
| No. 7  | " " " " 7,520 "               | 8,060 "    | Broke 2½ inches outside of weld.                 |
| No. 8  | " " " " 8,260 "               | 8,300 "    | Broke outside of the weld.                       |
| No. 9  | " " " " 8,000 "               | 8,450 "    | Broke at 4½ inches from the weld.                |
| No. 10 | " " " " 7,910 "               | 8,270 "    | Broke at 7 inches from the weld.                 |

The metal was not selected, a sheet of the ordinary commercial delivery being taken. The differences between the halves, where the breaks were outside of the welds, were doubtless due to slight differences in cross section of the metal. Only three of the breaks were in the weld. In the other seven the welded seam was as strong as the unwelded metal. The break in the No. 2 weld was the poorest, but showed 80% of the strength of the unwelded solid

metal. The average of all ten welded seams showed 95.6% of the strength of the unwelded metal.

The greatest advantage of this method of electric welding of water pipes is in the saving of metal possible by reason of the greater tensile strength of the welded seam, as contrasted with the strength of the double riveted seam. The latter has at the best not more than 70% of the strength of the solid metal, as compared with 95% strength of the welded seam. This makes possible the saving of not less than 25% of the weight of sheet metal required.

### American Methods Leading.

Dr. A. Wiegand, a German mining chemist, who is making a tour of the world, inspecting the mining properties of various countries, has given his views regarding American miners and their methods.

"The American mines and miners are ahead of everything," he says. "I have found that an American miner was capable of doing twice as much as a Mexican miner, three times as much as a Japanese or Chinese. I must confess that I was really startled at the amount of work done in an American mine. Our country, I might say, is working in the tail-end, where Americans left off long ago. The Americans are practical, in my opinion, just a little bit too practical. While they are the foremost miners in the world, I believe they should inject just a little more mining knowledge into their work. The superintendents of your mines are all young men, just an opposite condition with my country. All of it has been of great interest to me, especially the American mining machinery, the finest to be found anywhere. By saying that my country is working in the tail-end, I mean that the German Government is working mines paying only 2% of capital. This the Government does to give employment to miners, whose ancestors, probably a thousand years before, were miners. In Mexico I was astonished to see the finest mines in the hands of Americans and Englishmen. You can not find a good mine in the hands of Mexicans. It is ridiculous how cheap a mine can be bought there. I met a number of Mexicans, owners of splendid mining properties, willing to sell a portion of the land for \$5000 or \$10,000, gold, or either would accept a stated sum and go into partnership with Americans or Englishmen. The Mexicans seem to lack energy and also do not apparently want to develop the properties. If the present influx continues into that Republic, all good mining properties will be in the hands of foreigners within two years. In China and Japan I also met with surprises, especially in the latter country. There I found the latest American mining machinery and the mines being conducted by Americans, Englishmen or Germans. The Japanese are a thrifty and hard-working people, but have not mastered mining like Americans."

A New Air Compressor.

The accompanying illustration of a new air compressor manufactured by the Sullivan Machinery Co. shows a design containing many novel features tending toward a more simple combination of the best devices used in machines of this class.

No one portion of a compressor has given so much trouble to both users and designers, as the inlet valves and the mechanism controlling them. A wide variety is shown in the designs of various makers. The simplest have usually been uneconomical, and those that are more economical have often been unreliable. On the proper action of these inlet valves depends to a large extent the efficiency of the whole machine. The two best known types used are the automatic spring poppet valve and the mechanically moved Corliss valve. The chief objection to the first is that a vacuum is induced by the resistance of the springs used; the second is often difficult to maintain in proper adjustment, as to time of opening and closing, and tends to get leaky by reason of the severe strain it encounters. This type of valve usually requires a complicated moving mechanism.

In this new Sullivan compressor a combination of the economy of the Corliss type of inlet valve is made with the practical simplicity of the poppet valve. In this machine the inlet valves of the low-pressure cylinder are of the poppet type, with the valve stem

connecting through springs to plungers which are attached to yokes at each end of the cylinder. These yokes are operated through a motion rod by a cam attached to the crank pin. The motion given opens and closes the valve quickly and keeps them in a state of rest, both open and closed during the proper time. This cam device, while new in air compressor practice, has been used many years in steam engines and has proven itself to be accurate, durable and nicely adjusted to this service.

The machine is essentially a straight-line, two-stage compressor, but the usual design has been departed from in several particulars. The high-pressure air cylinder is placed on the extreme end of the frame, and as its discharge pipe is beyond the end of the foundation the cutting away of the masonry is avoided, and at the same time the joints are easily accessible. The low-pressure air cylinder is midway in the frame, which is the most convenient position for attaching the motion rod for the inlet valve. By this arrangement of the air cylinders, the large piston rod passes through the larger cylinder heads and the small rod in the smaller head, avoiding a large stuffing box in the small cylinder-head and giving more available space for valve area. As the piston rod does not pass through the high-pressure cylinder, one stuffing-box only is needed, and one small stuffing-box is exposed to high pressure instead of two larger ones.

The flywheels and shaft are on the other extreme end of the frame, thus the eccentrics, cranks, connections and other moving parts that require most attention are in the most accessible place, either for inspection while running or removal for repairs.

The frame is designed so that all drips of oil or condensation are kept from the foundation and carried to a convenient trap. All cylinders are made with forced liners. Openings are provided for washing out the jackets. The inter-cooler has large cooling surfaces. Copper tubes are used, which are made safe from leakage by a simple and durable device. A feature of this inter-cooler is that both air and water are baffled and traverse its length three times.

The steam engine valve gear is of the Meyer adjustable cut-off type, but the valve is provided with the Richardson balance. The swivel pattern cross-head is used and swivel pin is held in a device which provides for the take up of wear. The governor used is a combination of the centrifugal ball and pressure types, giving a sensitive adjustment to the varying consumption of air, and also providing against disastrous runaways.

The makers of this machine say they have aimed to produce a compressor of the highest possible grade, combining the best known reliable devices to obtain a simple, durable and efficient machine.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

### CIRCLE CITY.

F. J. Dinan says of the Birch creek placer district, 75 miles back of Circle City, which he visited lately, that the place has a future under improved methods of mining. Several hundred men were engaged working on the various streams tributary to Birch creek this summer, and every operator engaged made something after having paid \$1.20 an hour for labor. The gold is worth more than \$19 an ounce. Thirty ounces to the box length was taken from Sutter's claim on No. 6 above on Eagle creek every eight days with five men shoveling in during the day and five at night. Sutter made a clean profit this summer of \$6000. Others did almost as well. From Circle City to Eagle creek, 75 miles, the charge for freighting is 30 cents a pound, and to Miller, 65 miles, it is 25 cents. In all probability a road will be built into Birch creek district soon, perhaps next year.

### COOK'S INLET.

The Turnagain Arm G. M. Co., incorporated under Arizona laws, is owned principally in Minneapolis, Minn., and in Milwaukee. J. L. Michaels of Minneapolis is president, and L. S. Ovitt of Waukesha, Wis., is secretary. The company has made the first "cleanup" of gold from its claims on Gulch creek in Turnagain Arm. The amount, all in nuggets and coarse grain gold dust, weighs about fifty pounds. It is proposed to work the claims by hydraulicking and a plant has been installed.

### JUNEAU.

In Gold creek, at Juneau, the Ebner G. M. Co. will install twenty-five additional stamps in the spring. The London Exploration Co. will commence the long tunnel which they propose to drive from the head of the Last Chance mine to open up their property, upon which they have been making milling tests the last two years. This tunnel will be 6300 feet long, costing not less than \$150,000, including upraise.

C. Pierce, general superintendent of the Alaska Perseverance mine, is now building boarding houses and preparing to house a large force of men to drive a 2400-foot tunnel still farther up the creek to open their mines.

### KETCHIKAN.

At the Gold Mountain group, Helm bay, under bond to a New York company, the camp, consisting of assay office, bunk house and cook house, has been established, a crosscut tunnel is being driven 130 feet to cut the vein at about 80 feet from the surface. The crosscut is now in about 60 feet. Other development work is under consideration.

At the Copper Mountain mine at Coppermount, Prince of Wales island, the developments at present consist of a tunnel in about 300 feet at a depth of 75 feet below the outcrop, and all the way in very high grade carbonate ore, together with a winze, about midway between the two ends, sunk to a depth of 75 feet, also all the way in ore of the same grade. The last shipment made to the smelter was settled for on the basis of 29½% copper. The mine is now in condition to make shipments up to the full capacity of the aerial tramway which delivers the ores to the bins on the wharf. The company has made six shipments to the smelter since July, in all 1125 tons, and the net returns from the smelter have been from \$50 to \$60 per ton. The carbonate ore is gradually being replaced by black oxide of fully as high grade and about as easily mined as the green carbonates.

## ARIZONA.

### COCHISE COUNTY.

Supt. Dwight of the Bisbee West M. Co., near Bisbee, says that recently, upon reaching a depth of 725 feet in the main shaft, so much water was encountered that the company contemplates the installation of a large pump to be operated by compressed air.

Over in the Dos Cabezas mountains, in the eastern portion of the county, the Pearl G. M. Co. is running a tunnel now in 180 feet on ore all the way. In the tunnel the company is sinking a winze on a rich streak of ore. The shipping ore will run in the neighborhood of eighty ounces to the ton.

At the Buckeye M. Co. camp, near Bowie, a tramway from the mine to the mill site is being built and grading is under way for the 50-ton concentrating plant.

### GILA COUNTY.

Denver men have bought six claims from Goodwin, DeCloss & Hechtman, located near Globe. There are several large

veins on the surface, all of which show values in gold, silver, lead and copper. A shaft 20 feet deep shows a vein of copper ore 2 feet wide, which averages 15% copper, besides other values. The buyers are R. M. Force, F. A. Wright, C. V. Mead, J. D. Whitman and C. W. Merritt, and they have organized the Arizona-Colorado Copper Belt & G. M. & M. Co; capital, \$2,500,000; office at Globe and a branch office at Denver.

### GRAHAM COUNTY.

R. Fleming, who is interested in the strike in the Galluro mountains, says the face of the ore body, where it is crosscut by the canyon, is 600 feet wide, and the ledge can be traced along the hill either way from the canyon for thousands of feet. Mr. Fleming says that samples from all over it show good values. A company has been organized for the purpose of developing the mine and building reduction works. Twelve miles from the mine there is good natural water power, and it is proposed to generate electricity for reduction purposes and transmit by wire to the plant, which will be near the mine.

### MARICOPA COUNTY.

The Socorro G. Co., Mr. Witherlay manager, have commenced their 30-stamp mill construction in the Harqua Halas, 65 miles southwest of Wickenburg.

### SANTA CRUZ COUNTY.

M. Lully of the Santa Rita M. Co.'s mines, near Nogales, says that the company had forty men working. The shaft is down 240 feet and work will be continued on it to a depth of 500 feet.

### YAVAPAI COUNTY.

Oil is to be substituted for coal at the United Verde mine, Jerome, and at the Old Dominion mine, Globe. Tests have been made, and oil has proven entirely satisfactory at both plants. The coal now used at the United Verde comes from Senator Clark's mines at Gallup, N. M., the United Verde Co. paying \$90,000 per month for freight charges alone on coal and coke. Experiments are in progress in many other copper plants, including the Shannon and Detroit Copper Co. at Clifton, and it is likely that oil will become generally used in the operation of hundreds of plants, where the high freight rates put coal prices so high that operation is now unprofitable. The oil to be used will come from southern California and Texas.

## CALIFORNIA.

### AMADOR COUNTY.

The Amador & El Dorado M. & M. Co., owner of the Upton mine, near Plymouth, has completed a boarding house. Work was commenced recently erecting buildings for a 10-stamp water power mill. The buildings will be completed by Dec. 15. J. F. Taylor, secretary and manager, is superintending the work. A tunnel has been driven 300 feet along the ledge, 100 feet below the surface, showing a continuous ledge 2 feet thick between granite and porphyry. The ore assays about \$10 a ton.

The mill at the Amador-Phoenix mine, at Irishtown, is expected to begin crushing by the first of December. The shaft is now down 110 feet and will be sunk 30 feet deeper. A station is being cut at the 100-foot level and a crosscut will be made to the ledge. S. G. Spagnoli of San Andreas is one of the principal stockholders.

A good ledge is reported struck in the Slaughterhouse mine, at Oleta. The rock assays \$50 per ton and the ledge is 3½ feet wide. W. Rutledge is Supt.

### BUTTE COUNTY.

J. T. Sparks, formerly of Lovelock, has made surveys of a tract of drift placer land in the neighborhood of Chaparral House, on the Oroville & Susanville road. He has organized the Red Gravel Channel M. Co. to open this ground.

### CALAVERAS COUNTY.

Sinking is going on in the Sheep Ranch mine, at Sheep Ranch, and it has been decided to run the shaft 150 feet farther before opening any more levels.

The Calaveras mine, near Sheep Ranch, is being developed. The machinery belonging to the old Pioche mine has been removed to the Calaveras mine.

At the Mead mine, at Rich Gulch, work is being pushed by Supt. J. Thors. To handle the large flow of water a steam power pump and hoisting rig has been put in.

At the Fanny Marie mine, at Glencoe, owned by Boston people, eight buildings have been erected and water pipes have been put in. The old winze was sunk 40 feet deeper and a 2-foot lead of high-grade ore has been exposed. It is the intention of the owners to soon erect a stamp mill at the mine.

The Calaveras Water, Power & Mining Co. are putting the Round Butte gravel mine, near San Andreas, in shape for winter working. The three restraining

dams on Baptiste creek have been completed and accepted by the Government. The upper ditch taking the water from San Antonio to O'Neill's is completed. The dynamo for the electric plant is ready to be put in place.

The Johnson mine, near Glencoe, is at present being developed by Cripple Creek, Colo., people. A strike of ore has been made in it which it is claimed will run \$150 to the ton.

J. Thors, Supt. of the Mead mine at Rich Gulch, says much water has been encountered, which has necessitated the putting in of steam power for hoisting and pumping.

At the Fanny Marie mine, at Glencoe, the bottom of the old shaft has been reached and drifting has commenced. An old winze 40 feet deep was sunk an additional 40 feet, at which point a 2-foot ledge of good ore was struck. The rock shows free gold and is high grade. The company has erected eight new buildings, and as soon as the main ore body is struck a mill will be erected.

Cripple Creek, Colo., people are engaged in developing the old Johnson mine, near Glencoe. They have struck four parallel leads. The ore will average \$25 a ton.

### EL DORADO COUNTY.

The Lone Star drift mine, at Smith's Flat, near Placerville, is being reopened by H. Reeve, representing a San Francisco company, who has let a contract to Hughes & Gregory Bros. to take out and mill 2000 cars of gravel.

It is reported that operations will shortly be begun on the South Sligo mine at Spanish Dry Diggings. C. W. Keeny is superintendent.

### HUMBOLDT COUNTY.

(Special Correspondence).—The Orleans Bar G. M. Co., a New York corporation, is operating on Graham's Flat, near Orleans Bar. The water supply is at present short, but two giants (a No. 5 and No. 4), under pressure of 300 feet, are cleaning bedrock and washing gravel. The bank is 50 feet high, with a light gravel easily worked. The water is brought from Camp creek in a ditch and flume some 12 miles long. Seven miles of it are flume. There are two sawmills on the property and there is a telephone to the head of the ditch.

Considerable prospecting is being done in the Red Cap creek district for copper. Some very fine rock and a little native copper has been discovered, but no true ledge has yet been found.

There are several small but good mines in the vicinity of Orleans—the Pearce, Salstrom, Wilder and Markusen mines—but the inaccessibility of the country is very much against successful development. It is reached either from Yreka, via Etna to Sawyer's Bar by stage, and thence by trail via Bennett at the forks of Salmon river, or another from Eureka, by Arcata and Hoopa valley. The nearest wagon road is 30 miles away and all supplies have to be packed in on mules.

Orleans, Nov. 15.

### NEVADA COUNTY.

Under Supt. Miller, the Stiles mine, at Nevada City, is showing well. The north drift from the bottom of the incline is in 175 feet and the 10-stamp mill is running steadily.

At the Mountaineer mine, near Nevada City, Supt. Dennis is investigating new machinery for working the ore. It is said a dry process will be installed. Roll crushers will reduce the rock instead of the stamp mill, and from the crushers the pulverized ore will go to dry concentrators to separate the tellurides which ordinarily float from the plates in a mill.

Supt. Gassaway is rushing work at the De Noon gravel mine, near North Bloomfield. Some 2000 feet above the mouth of the tunnel a shaft has been sunk which is now down to the level of the tunnel, and as soon as the compressor is in operation work will begin both ways from the bottom of the shaft. The tunnel is now in over 200 feet. It is estimated that the tunnel will have to be run about 5000 feet to enter the channel. The work from the time of the start, it is expected, will take about fifteen months.

The Hunkin quartz mine at Omega, C. W. Porterfield owner, it is reported, will be opened by a San Francisco company next spring.

The new gravel crushing mill at the Grizzly Hill mine, above Nevada City, is now in operation and is estimated to be handling about 240 tons of cemented gravel daily. J. F. Dudley is foreman of the mine and there are about fifteen men employed.

G. W. Hay, Supt. of the Ironclad mine, below Rough and Ready, says the hoisting and pumping machinery is now in place and the pumps have started to lower the water in the 180-foot shaft.

J. P. Wood, who has the bond on the Sharp mine at Canada Hill, near Nevada City, intends to resume operations on it

in the spring, when it is expected that machinery will be erected.

### PLACER COUNTY.

The Shady Run M. Co. has its stamp mill, buildings and road completed. The stamps will be put in as fast as there ore to crush, and when completed there will be forty.

Two carloads of ore from the Lost Emigrant mine, located about 16 miles southwest of Summit, returned \$3500. The ore on one car assayed \$135 and the other \$178 per ton. F. L. Heath of Colfax is one of the owners.

### PLUMAS COUNTY.

The Adelaide M. & M. Co. has been incorporated, with office in Reno and its works in Plumas county. R. C. Taylor is general manager and J. Sunderland, Jr., secretary. The company has started work to continue through the winter.

### SANTA CLARA COUNTY.

Gold and silver ore in paying quantities is reported to have been found near New Almaden in a mine owned by W. H. Adams of San Jose. The ledge will assay from \$4 to \$6.50 in gold and from \$3 to \$6 in silver per ton. The mine is supposed to be rich in quicksilver, for which it was being developed. A hanging wall to a ledge had been encountered, and the workmen were at a loss to know what it was. On expert examination it proved to be iron oxide and pyrite carrying gold and silver.

### SHASTA COUNTY.

The Colorado claim, near Shasta, owned by W. Henry and J. Dawe, has a tunnel in 160 feet, which shows a ledge of from 6 inches to 6 feet wide, between well-defined walls. Where the ledge narrows the ore shows rich values and is good milling ore from wall to wall in wide places. Besides the 160-foot tunnel there is a shaft 60 feet deep on the mine.

A discovery of platinum is reported in the Postam Bros.' mine in Harrison gulch. It is said that many prospectors are out looking for the metal and numerous locations have been made. In early days considerable platinum was found in Brown's creek in this county and on the Trinity side of the mountain from Harrison gulch. It is thought that the platinum found along Brown's creek, and for several miles below where it empties into the Trinity, noticeably at the Chapman & Fisher mine, is a wash from a high deposit in the mountain near the summit of which the creek has its source.

### SISKIYOU COUNTY.

T. Y. Reed and O. H. Lawson of Yreka have taken up a quartz ledge on a supposed extension of the Yreka Flats claim. They intend opening it up.

The O. & C. quartz mill on Klamath river, above Ash creek, is nearly completed, and will be ready for operation in about two weeks. The mill is 10-stamp and the batteries will have two concentrators.

Rich ore has been struck in the Lanky Bob mine on White's Gulch, near Sawyer's Bar, by J. G. Skillen, who has a lease on the claim, from H. Finley. The vein is from 10 to 12 inches in width. He has started an arrastra on a 50-ton crushing. The ore is said to prospect \$100 a ton.

### TUOLUMNE COUNTY.

The Stockton Smelting Co. has decided to locate its smelter in Sonora rather than in Stent or Jamestown. The company has concluded the lease of the Mason reduction works in Sonora.

The Campo Seco G. M. Co., with office at San Francisco, has been incorporated by H. A. Crane, S. Salomon, S. A. Federici, A. Ortion and F. P. Canac, all of San Francisco, with capital \$500,000, to operate in Tuolumne county.

The Yankee Hill M. Co. has been incorporated, with office at Santa Ana, Cal., by A. J. Padgham, A. R. Lowley, J. E. Luther, L. Padgham of Santa Ana and F. H. Roberts of Escondido, capital \$125,000, to operate in Tuolumne county.

The Verona M. Co. has been incorporated in Arizona, with office at Phoenix, Arizona, and a branch office in San Francisco, by J. P. E. Heintz, H. C. McPike and R. D. Duke, capital \$500,000, to mine in Tuolumne county.

W. H. McClintock has bonded the Haskell ranch of 724 acres, near Jamestown, and will develop it for mining.

The necessary buildings are being completed and machinery erected on the Doyle mine at Horseshoe Bend.

J. L. Halk has discovered a vein of ore on his ranch near Sonora. A shaft 60 feet in depth has been sunk on the vein, the rock assaying \$25 to the ton. A 6 H. P. gasoline engine has been installed to furnish power for a hoist.

B. Soulsby of Soulsbyville has bonded to M. Innes of San Francisco the Donella, Champion and Pleasant Hill quartz mines, near Arrastraville, for \$1500 down and balance of \$15,000 within eighteen months.

W. Westlake and associates of San

Francisco have bonded the Seminole mine, near Carters, and will commence operations on a large scale. A new boiler and hoist have been installed and the work of unwatering the mine commenced. The shaft is 318 feet deep. The mill is being put in readiness for crushing as soon as the mine is free from water.

Operations at the Prudhomme mine, near Carters, have been resumed after a suspension of several weeks, caused by failure of the water supply. It is the intention to put up a hoist that will enable sinking to a depth of 800 feet, and run it by steam power, instead of water power as at present, using the latter only for the mill.

A. H. Hiatt and V. Haynes have bonded to G. Lightfoot the Victoria No. 1 and Victoria No. 2 quartz mines, near Sonora, also a 2-stamp quartz mill, at \$20,000, until Nov. 1, 1902. Mr. Lightfoot is to begin operations on the mine before May 30, 1902, and keep at least four men continually employed.

J. E. Summers and J. Gloster have bonded to A. White of Vallejo a half interest in the Hardtack mine, near Sonora, for \$10,000, until Nov. 9, 1902. The mine is to be developed by Mr. White.

#### COLORADO.

##### CHAFFEE COUNTY.

Under the assurance that the Aspen-Buena Vista railroad will be built, the mining situation in and around Buena Vista is improving. Within the past few months many heretofore abandoned mines have been leased and operations resumed. A company has been organized, capital \$125,000, to build a copper matte smelter at Buena Vista early next spring. The principal stockholders in the smelting company are already interested in the different mining companies organized by Mr. Bowman of Buena Vista.

The Hamilton M. & T. Co. are in 312 feet on their Kosman crosscut tunnel, nearing the Doctor Pass vein. This company have good pay ore in their Crown Point and Allentown, which they will get at through the Kosman tunnel at a depth of nearly 1000 feet.

##### DOLORES COUNTY.

The Rico M. & M. Co. has just shipped a full trainload of zinc concentrates to the Vieille Montagne Zinc Co. at Antwerp, Belgium. The mill has now been running since February, being increased in capacity till it now treats sixty tons of ore daily. The product is divided into three classes, zinc, lead and iron. The zinc concentrates now run up to 55% to 60%, and carry less than 4% iron. The lead concentrates go above 60% and carry less than 3% zinc. The iron is practically free from both lead and zinc and is a desirable flux for a local smelter. D. H. Campbell has succeeded L. D. Mather as local manager, C. D. Hooper has succeeded E. B. Green as head millman, and T. Thompson is in charge of the mines.

The machinery for the Mt. Goram M. & M. Co.'s new 10-stamp mill for the Smuggler mine at Rico is being set up, and it is expected to start the mill by December 1st. The mill is steam heated and lighted by electricity. The capacity is estimated at thirty-five tons daily. A wire rope tram, 700 feet in length, is used to take ore from mine to mill.

##### GUNNISON COUNTY.

J. K. Hallowell of Chicago has bought the Forest Queen mine, in the Irwin district, near Gunnison, from the Forest Queen M. Co., which had F. W. Fuller as manager. The property is bought for Milwaukee people. The mine was located and developed into an extensive shipper in the early days. It has been practically idle since 1893.

The Belgora-Bassick M. & D. Co., operating a group of thirteen claims near Pitkin, says work will be pushed throughout the winter. The company is now under the management of W. S. Henderson, secretary and treasurer.

##### OURAY COUNTY.

The Teller Mines Co., near Ouray, has commenced active operations for the winter. The Teller has been worked intermittently by leasers during the past three years, but new owners have the mine now and will develop it and other adjoining claims. The tunnel is in 575 feet. A. Arps of Ouray is president of the new company, and L. G. Brewer secretary. L. P. Pliskaer is Supt.

The Colorado Gold-Copper M. & T. Co. has resumed operations and will immediately erect a generating station and power plant to put air drills at work before the year closes. F. Carney and F. J. Hulaniski of Ouray are directors of the company.

##### SAN MIGUEL COUNTY.

The buildings at the mouth of the Bullion tunnel, through which the Smuggler-Union mine at Telluride is worked, were destroyed by fire on the 20th and the mine

filled with deadly gas and smoke. It is feared the loss of life will reach nearly, if not quite, thirty. The fire started about 7 o'clock in the morning from a defective flue in the bunk house and quickly communicated with the other buildings. The dense smoke from the burning transformer house, which was saturated with oil, went into the tunnel, the shafts of the mine acting as chimneys to create the indraft. The day shift were on duty and before they could be warned the levels and stopes were filled with smoke and gas. They made efforts to reach the surface through old upper workings, and about half of those in the mine escaped. Twenty-two bodies have already been recovered from the No. 7 level, and seventy-five men were known to be at work on the ninth level, which had not been reached when this was written. A rescuing party cut a connection through from the Commission workings adjoining and took out part of the men who escaped. The draft into the mine of the smoke, which continued after the buildings were burned down, was finally shut off by blasting rock into the tunnel. The Smuggler-Union M. Co., which owns the mine and tunnel, is composed of New York and Boston people. A. L. Collins and B. B. Lawrence are the managers, both of whom, it appears, were absent from the mine at the time.

##### SUMMIT COUNTY.

The recent copper discoveries made in the range on the east bank of Blue river, 41 miles north of Breckenridge and 12½ miles south of Kremling, is reported indicate that a good camp will be started there.

##### TELLER COUNTY.

(Special Correspondence).—The Mary McKinney is shipping sixty tons of ore per day, which runs \$40 to \$50 per ton, most of which goes to the smelter. This production comes from all the different levels. Supt. Keener states that a large amount of development is being done. The drifting on the fifth level equals 2400 feet.

Anaconda, Nov. 9.

(Special Correspondence).—The El Paso mine, on Beacon hill, has become one of the important producers of the district, and it is given out that it will soon be a dividend payer. The holdings of this property amount to sixty-one acres and are owned by two or three shafts. The main vein extends nearly northerly and southerly. The principal working shaft is 600 feet deep with drifts and levels from it aggregating 1200 feet. On the 600-foot level an ore shoot is opened 300 feet in length and has a width of ore 2 to 16 feet. The shipments now are said to be worth about \$2000 per day, much of the ore averaging \$150 per ton.

Supt. W. M. Bainbridge has installed an interesting ore-washing device. The ores come from the mine in a damp condition, with considerable amount of loose, decomposed material adhering to it. After being screened this ore passes through chutes to the sorting bins, but on the way is subjected to jets of warm water from the boilers, washing off the pulverized particles into a V-shaped spout, the latter emptying into a settling tank. The settled slimes and pulp thus caught amount to 1200 pounds per day. After the water is poured off, the pulp is dried by exhaust steam pipes and is found to run \$150 per ton, consisting of particles of sylvanite from the ore seams. This rich ore from the sixth level of the El Paso is in the granite, below the phonolite.

Supt. Bainbridge states that about Jan. 1, 1902, he will begin sinking a new three-compartment shaft. It will be 5x14 feet in the clear, the main cageway to be 5x6 feet. Instead of having a double-deck cage, he will provide for a double-track cage, so that two cars may ride side by side. A second cageway for men will be 3½x5 feet. The third compartment will be 4x5 feet for pipes, pumps and ladder. S. S. Bernard, Colorado Springs, is one of the principal stockholders of the El Paso Co.

Cripple Creek, Nov. 9.

(Special Correspondence).—The Elkton, of which Sol Camp is Supt., is shipping about 2000 tons of ore per month, running about \$60 per ton. The shaft is 80 feet deep, from which 1600 gallons of water per minute are pumped. The present tonnage of ore comes from the 600 and 700-foot levels. George Bernard, president of the Elkton Co., states that the average gross value of the ore produced for the year ending May 31, 1901, was \$60.33 per ton, the output for that period amounting to 19,080 tons. The underground development for same period aggregated 4812 linear feet, the stoping amounting to 14,800 square yards. In drifting southward on the 700-foot level a new 5-foot vein of \$50 ore was opened. The mechanical equipment and buildings are among the best in the district. Their hoister is 20x48 inches, duplex Corliss,

with an estimated speed of 2000 feet per minute. The compressor, of Ingersoll-Sargent type, has high and low pressure steam cylinders, air cylinders, all having 48-inch stroke. It has a capacity of 3120 cubic feet of free air per minute. The Prescott condenser attached is 10x16x18. The power is furnished by three Cahall horizontal water tube boilers. The ore house has capacity of 200 tons, with storage bins of 1000 tons capacity. Elkton dividends for the year amounted to \$300,000.

Elkton, Nov. 9.

The Steelsmith lease on the Findley, it is said, will not be extended. The owning company will take hold of the property in its own behalf and continue active operations. Machinery, including a 10-drill compressor, will be installed and extensive development will be started. The new hoist will be of sufficient capacity to lift from a depth of 2000 feet.

The Pinnacle Co. has bonded its fractions, the White Elephant, Dollie R. and Overlooked claims, containing about three and a half acres of ground and which carries about 400 feet of the ore shoot that was recently opened by Terrill and Burke on the Colorado Boss of the Cripple Creek Con. Co. The bond calls for a payment of \$45,000 and runs for a period of two years.

Sioux City, Iowa, people composing the O. K. M. & M. Co., are erecting a 25-ton cyanide mill on Four-Mile creek, 5 miles west of Cripple Creek, to treat the ores of their mines in the Bare Hills district.

##### IDAHO.

##### ADA COUNTY.

D. H. Moseley, Supt. of the Delhi mine, near Boise, says that the mill will be completed by December.

##### IDAHO COUNTY.

E. A. Meade, who has been in the Thunder mountain district investigating for the Oregon Short Line Railway, says the district is exceedingly rich. He followed the main ore body underground for 200 feet in one direction and for 245 feet in a general way at right angles to the other. Running through the main body is a vein 4 feet thick of free milling ore which will run high in value. The main body of the ore of Thunder mountain, he thinks, will run as low in value as \$7 a ton.

A 25 H. P. boiler, a complete sawmill outfit and a 10-stamp mill have just been packed to the Thunder Mountain camp on mules, and Supt. Babbitt says that the mill will probably be running by the first of December.

A mining company, formed to develop claims near Dixie, has been organized at Pendleton, Or., with S. H. Riley, W. T. Rigby and J. T. Kirk, all Umatilla county men, as incorporators.

##### OWYHEE COUNTY.

It is reported that J. Sullivan has struck a good vein in place on the Sullivan & Noble property, near Silver City. It is believed to be the source of the placer gold found close by.

##### MISSOURI.

##### JASPER COUNTY.

At Oronogo, near Joplin, the entire plant of the Aurora M. Co., comprising a 100-ton mill, office building and engine house, together with six gravel cars and an immense tailing pile, were swallowed up in a cave-in of the mine underneath. The workmen heard the timbers cracking before the cave-in started and signaled to be drawn up. The last man had reached the surface only a few minutes when the timbers collapsed, the earth yielded and with a crash the whole plant sank into the abyss. Further caving is feared and work in that vicinity has been suspended.

##### MONTANA.

##### FERGUS COUNTY.

A. H. S. Bird of the Johanna G. M. Co. of Salt Lake City, Utah, has arranged to extend the time for the final payment on the \$80,000 bond on the Spotted Horse mine, near Lewiston. The Central Montana Mines Co. made the initial payment last spring.

##### GALLATIN COUNTY.

McCoy & Co., who are interested in the corundum mines on Camp creek, have bought an old shingle mill near Salesville, to use it for the installation of an electrical plant. The power generated at Salesville will be conducted to Camp creek and used to operate the machinery which the McCoy company will soon place on the property.

##### MADISON COUNTY.

A mining company has been incorporated in Utah, capital \$1,000,000, to mine in the Rabbit mining district in Madison county. The incorporators are: A. W. McCune, Jr., J. S. Wells and L. Seckel of Salt Lake City, Utah, and F. E. Sergeant of New York. C. H. Hand of Butte is named as the Montana agent of the company.

##### SILVER BOW COUNTY.

The Butte & Iowa M. Co., which is developing the Colorado claim at Butte, has struck a vein of copper-silver ore that is claimed to assay 7% copper and eighteen ounces in silver. Supt. Hewitt reports that the shaft is down 250 feet. At a depth of 230 feet the shaft cut a lead from 24 to 30 inches wide, composed of quartz, heavy in iron, assaying 18.4 ounces in silver and 6.8% copper.

##### NEVADA.

##### ELKO COUNTY.

At the Dexter mine at Tuscarora ore is being sacked that shows from \$300 to \$600 gold, the ore coming from a streak that was encountered in the main drift connecting Dexter workings with the Tuscarora.

##### HUMBOLDT COUNTY.

The Glasgow & Western Co. at Golconda has made plans for the enlargement of the 100-ton smelting plant, and by December 10 it is expected that the estimates will have been received and approved by the directors of the company in Glasgow, Scotland. As soon as this is done the enlargement of the smelter to 300 tons a day will begin. At the same time the company will start to bore for artesian water.

##### LYON COUNTY.

Salt Lake City mining men have bonded from W. Woolcock and J. Phillips of Winnemucca the Sheba mine and ten other claims near Mill City at \$31,000 in two years, paying \$500 down.

J. Kernan of Mason Valley is developing a mining location, ore from which is claimed to carry a gold value of over \$100 per ton. The mine is located a short distance from Yerington and the vein so far developed has a width of nearly 2 feet.

##### NYE COUNTY.

A carload of Tonopah ore is to be tested at the Rock Point mill and cyanide works near Dayton. A 100-pound sample has been worked which yielded a high percentage of the total assay value, contrary to the belief that Tonopah ore is base and the extraction of its bullion values impracticable by any process but smelting. If the test proves the ore to be practically free milling, or of such a character that it may be cyanided, it is likely that the ore will be worked in the Carson river mills.

Three railroads are planning to build into the Tonopah district, but all are awaiting further development of tonnage before starting. The three roads are the San Pedro, the Nevada Central and the Carson & Colorado, a branch of the Southern Pacific. The route from Soda-ville, on the Carson & Colorado branch of the Southern Pacific, is said to be the simplest and easiest.

##### WASCOE COUNTY.

T. Davidson of Lovelocks has discovered a large deposit of copper 10 miles north of Rye Patch. Assays from an average sample of the ledge where it is 4 feet wide go \$50 per ton.

##### WHITE PINE COUNTY.

The Gold Nugget Co. of Ely, W. B. Lawler manager, has received returns from a test carload shipment of ore, 5.23 ounces of gold and 207 ounces of silver, or about \$225 per ton. A sample of low-grade ore returned between \$50 and \$60 per ton.

##### NEW MEXICO.

##### COLFAX COUNTY.

Work has been resumed on the Horse-shoe tunnel, near Elizabethtown, after having been closed down for three years.

The Belle mine and five adjoining properties, near Lordsburg, owned by Brown-Jernigan & Wood, have been bought by A. E. Gibson of Santa Fe. Systematic work will be commenced at once.

##### SIERRA COUNTY.

The mines of the Silver M. Co. at Lake valley are being reopened. The old workings of the mine will be retimbered and thrown open to leasers and new ground is to be opened by the company. New buildings are to be erected.

J. J. Blow & Co. are working the Marion mine in the Caballos mountains. The tunnel is now in 600 feet, with about a 3-foot lead of copper in the face. Two carloads of ore per month are being shipped, the ore averaging 23% copper. Eight men are employed.

The Las Animas G. & C. M. Co. has resumed work on the Wicks mine, near Hillsboro.

##### OREGON.

##### BAKER COUNTY.

The Copper Ridge G. & C. M. Co., capital \$1,000,000, has been incorporated by E. E. Cleaver, W. G. Drowley and W. W. Reese. The property is the Copper Ridge mine, consisting of four claims in the Quartzburg district. The ledge in the Copper Ridge is 70 feet wide on the surface, and surface assays give an average

of \$32.28 per ton in gold and copper. Mr. Cleaver bought this mine last year for \$15,000, and has worked it continuously since then. The mine will now be developed on a large scale.

The Cornucopia Co.'s mines at Cornucopia have shut down operations for the winter, a few men only being retained to block out ore and keep the mine dry. It is claimed that there is blocked out in the Last Chance claim 30,000 tons of ore which, it is said, will go \$40 to the ton.

The Timber Canyon mines, near Virtue, have been sold by J. Thompson to T. C. Burke. The ledge is claimed to have an average width of 5 to 12 feet through the length of the nine claims in the group. This property has been worked by an arrastra, from which values are said to have been obtained as high as \$40 to the ton. A contract has been let for resuming work on the upper tunnel, which will cut the ledge about 200 feet in depth with about 40 feet of additional work. A 10-stamp mill is projected.

The Flagstaff mine, near Baker City, has been started up, after a shut-down of sixteen months, under the direction of Managers Davis and McLain, who represent the new owners, a New York company, headed by P. H. Campbell. Twenty miners have been put to work and development work started. A compressor and air drill plant is to be installed.

The erection of the new hoisting plant and sinking of the new three-compartment shaft at the Bonanza mine, near Baker City, is under way, and it is expected that before winter the plant will be so far along that it can be completed before spring. The new hoist will cost about \$200,000 when completed. Each of the two 200 H. P. boilers weigh 25,000 pounds. The hoist will have a sinking capacity of 2500 feet. The present depth of the mine is 400 feet. The mine is now employing 150 men, and the monthly output is said to be \$50,000 to \$80,000.

The Belcher mine, in the Greenhorn district, near Baker City, is showing improvement and is high grade, so Supt. W. N. Jackson says.

#### JACKSON COUNTY.

W. H. Maultby and A. Gilson, who have been prospecting at the head of Sterling creek, back of Ashland, have struck an old channel, which promises to be quite rich. A considerable body of gravel, that prospects well, is already in sight.

The machinery at the Exchequer mine, in Applegate district, south of Jacksonville, has been moved to the Rising Star mine by G. St. John, the Supt. of both properties.

#### JOSEPHINE COUNTY.

The opening up in the Silver Creek basin of auriferous gravel, by the running of a tunnel under Silver Creek Falls, is to be undertaken. About 100 feet of tunnel have been run. When opened, the dump for tailings is unequaled and mining grounds of great extent. The portion of the basin to be opened up by the tunnel is owned by Ferren & Thoss, but is under bond to Mettis & Leigh, Colorado men, who have the work in charge.

The Big Yank ledge, in the Galice district, near Grant's Pass, is being developed by the Big Yank M. Co. of Portland. A 100-foot tunnel has been run in, cross-cutting the ledge, and drifts have been run 50 feet each way. The ore is running \$25 to \$30 per ton.

At the lately discovered copper mines on Little Grayback, near Kirby, fifty claims have been taken up. The greater number are being developed. In some of the older claims tunnels have been run to a depth of 50 and 75 feet, or shafts have been put down to this depth. The ledges exposed show widths ranging from 10 to 150 feet, carrying copper values of from 5% to 30%.

#### SOUTH DAKOTA.

#### LAWRENCE COUNTY.

The building for the new sixty-ton cyanide plant in the Yellow creek district, near Deadwood, is completed, and the Alder Creek M. Co. will soon begin treating ore. It has bought the Little Blue Fraction and adjoining lodes, which carry quartzite ore, averaging about \$5 per ton gold.

The Hidden Fortune M. Co. is making arrangements to build its mills at Belle Fourche. H. J. Mayham, general manager, says the company will build a large stamp mill with a cyanide annex to make treatment of the ore practically the same as that used by the Homestake company adjoining. The cost of the railroad haul of the ore to Belle Fourche, 35 miles, is figured by the owners as compensated for by the saving in cost of water.

Deadwood business men and T. H. Smith of Boston, Mass., are considering a proposal of the latter looking to the building of a custom cyanide plant in Deadwood. A committee, consisting of McDowell, Hymer & Bischoff, were appointed to have full charge of further arrangements.

#### PENNINGTON COUNTY.

The Ohio-Black Hills G. M. Co. has been organized to develop 475 acres of mining ground near Rochford. The ground embraced is the Mary Belle mine and the Cyclone property, both having large veins of free-milling and concentrating ore. The Mary Belle mine has two separate veins of ore with a total face of 30 feet, which averages about \$5 per ton gold. On the Cyclone ground there is a vein of ore 55 feet wide at the outcrop, which it is said gives better than \$4 at the surface.

#### UTAH.

#### IRON COUNTY.

The Ophir M. Co. mill at Stateline, equipped at a cost of about \$80,000, has been started up by Supt. Lathrop. The mill has a capacity for treating 150 tons of ore daily.

#### SUMMIT COUNTY.

H. Coleman, S. Hare, W. DeLashmuth, T. Monks, C. Buehler and W. Van Wagner have bought a one-third interest in the St. Louis and Vasa mining claims, near Park City. They have taken a bond at \$25,000 and a two-years lease on the other two-thirds from F. W. Hayt and others. It is the new owners' intention to work the property all winter. Some very rich ore has been obtained from these claims, assays running from 70 to 1400 ounces silver.

#### WASHINGTON.

#### WHITMAN COUNTY.

The Gold Bug M. Co. has elected L. F. Smith of Endicott president, J. W. Cox of Garfield secretary and treasurer, W. J. Tipton manager and A. Burns foreman. The report of Manager Tipton shows the property to be in good condition. A shaft is now down 245 feet and will go to the 300-foot level, when drifting will begin on the ledge from both sides of the shaft. The mine is equipped with a steam drill, steam hoist and full equipment of machinery.

#### STEVENS COUNTY.

The Empire Marble & Onyx Co. has been incorporated at Spokane; capital, \$150,000. The officers are: J. O'Connor, president; J. R. Stone, secretary; J. Gray, Supt. The property consists of eighty acres of marble lands 3 miles west of Adry on the Spokane Falls & Northern Railway.

#### FOREIGN.

#### BRITISH COLUMBIA.

H. L. Harris has bonded a group of iron claims in East Kootenay district at \$120,000. He is said to contemplate the erection of iron furnaces at Frank in Alberta, to use coke from a battery of 250 coke ovens which it is said he will erect there.

B. MacDonald of Rossland and C. Dundee, president of the Dundee M. Co., have been making an inspection of the Dundee mine at Ymir. The mine is to be unwatered.

The London & British Columbia Goldfields Co. has bonded the L. Birtch mine at Ymir and set men to work, the price reported being \$35,000, with 5% down. The vein averages 6 feet in width and visible gold appears freely and evenly disseminated throughout that width.

A stamp mill is to be built on the Wilcox mine at Ymir, the construction to commence next spring. Meanwhile, however, some of the richer ore will be shipped to smelters and development will be continued.

The Department of Mines at Victoria has received many applications for information of the new Horsely Creek gold finds in the Cariboo district, and, in answer, are sending maps and all information of the district in their possession. A rush to the district is looked for in the spring.

Matte shipments from Greenwood are now sent to the Granby smelter at Grand Forks, where a converting plant is being installed. The Greenwood smelter produces from twenty to twenty-five tons of matte per day. This amount will be doubled early in January, when the second furnace is installed.

#### FRENCH GUIANA.

A report comes from Dutch Guiana that on the French side of the Demerara river, well inland, a big placer gold strike has been made. Many men working but a few days, in the most primitive form, it is reported, are taking out large amounts of dust. The letter making the report states that "it is a common daily occurrence to see men with ten, twenty and up into the hundreds of pounds of gold—results of a short period of panning. One man was seen with over eighty-five pounds from less than two months' work by pan. Another man, who has a reservation, is leasing in small blocks for 50% of the gross. He is said to have two kerosene tins (five gallons each) full of coarse and nearly half a one full of fine."

#### KLONDIKE.

A discovery of placers on what is called Quartz creek has caused a stampede from Porcupine, Haines, Juneau and Skagway. Two prospectors left Porcupine during the latter part of August for the interior, going over the Dalton trail. They left the trail at Dalton Post and went toward White river about 40 miles. Quartz creek was prospected by them and found at the surface to run several colors to the pan. Going deeper into the gravel, it yielded from 25 to 40 cents per pan. They felled a cottonwood tree, hollowed it out and, making a sluice box, worked for five days and then made a cleanup that amounted to over \$1000 gold. Fearing that others might drop in on their discovery before they had recorded, they quit work, staked their claims and went back to Pleasant Camp, where they secured their licenses and recorded their claims. Exhibiting the gold at Porcupine and making known the location of their find, a stampede was started at once for the new diggings. The new find is the rediscovery of an old one made in 1898 by prospectors from Shorty creek, on the Dalton trail. The Stick Indians have brought in nuggets from that section for some time. The winter snows will prevent any further prospecting till next spring.

Last year's output of the Klondike is given at \$22,500,000, while it is estimated the clean-up will reach the \$25,000,000 mark this year. The shipment for the four months ending Sept. 30 is as follows: June, \$5,918,000; July, \$9,725,000; August, \$3,000,000; September, \$3,000,000; total, \$21,643,000. The figures are from the records in the Gold Commissioner's office in Dawson, where certificates must be obtained by everyone shipping or taking out gold, under penalty of forfeiture of the dust for non-compliance.

#### MEXICO.

In the Rosalia claim of the Calera G. M. Co. in Sonora a body of high-grade ore has been struck. Manager A. F. Wuensch says his samples from the bottom of the workings show \$178 to the ton in gold. The find in the Rosalia of the Calera Co. gives the group three properties that contain high-grade ore, though the Calera claim six months ago was the only producer. A mill is now being erected on the San Miguel river to treat the output of the group.

The lost Tayapa mines, noted in Spanish records of Mexico as having produced \$80,000,000 in silver and gold in the seventeenth century, which are described on Spanish maps as being situated in northwestern Mexico, about 50 leagues from the sea, near Los Pilares, have been found. Explorers who have recently returned from Cianguita report having discovered the old stone prisons, old smelters, also stupendous work accomplished by the ancients. They say there are many tons of ore exposed, rich in copper, silver, gold, particularly sulphides, that could not be worked by methods then in use.

#### SOUTH AFRICA.

The October gold output of the Witwatersrand shows an increase of 1457 ounces over that of September.

#### Personal.

W. H. THOMAS of New York is at Greenwood, B. C.

DAVID LEMMON is the new foreman of the King Solomon mine, Deeth, Nev.

GEORGE HANCOCK succeeds John Roundy as Supt. Uncle Sam mine, Tintic, Utah.

C. JOHNSON has returned from a visit to Sweden and located at Cripple Creek, Colo., again.

J. ELLSWORTH has been appointed Supt. of the Occidental drift mine at Iowa City, Cal.

G. R. HANCOCK has succeeded J. Roundy as Supt. of the Uncle Sam Con. M. Co. at Tintic, Utah.

JOHN HAYS HAMMOND is now established in New York City, making that place his headquarters instead of London.

JAMES BREEN continues the management of the Dominion Copper Co., at Phoenix, B. C.

JOS. M. NOUGUES, JR., Supt. Josephine mine at Volcanville, El Dorado Co., Cal., was in San Francisco for a few days early in the week.

A. HALL, formerly foreman at the Massachusetts mine at Grass Valley, Cal., has been appointed Supt. of a lead mine at Cartersville, Mo.

BERNARD MACDONALD is managing the Nickel Plate mine, Rossland, B. C. W. H. Bryson has resumed the superintendency of the mine.

J. N. GRIFFITHS, managing director Ivory Coast Gold Fields Co., Ltd., of London, is reported en route to California to

investigate gold dredging methods. It is his stated intention to buy six dredgers for use by his company in French West Africa.

JAS. F. PARKS JR. of San Andreas, Cal., has gone to Korea, to remain there several years, under engagement to a large mining company.

BISBEE, ARIZ., expects that Ben Williams, the old-time Supt. there, will resume his former place at the Copper Queen upon his return from Mexico.

EDWARD BOOTH, instructor in the College of Chemistry at the University of California, has been elected secretary of the Pacific Coast Association of Chemistry Teachers.

R. SCHORR, M. E., consulting engineer for the Trinity Copper Co., Shasta Co., Cal., has resigned his position and on his return from Europe will open an office at Redding, Cal.

THOS. NEILSON, metallurgist and chemist, has resigned the position of mine superintendent for the Trinity Copper Co., and will locate in San Francisco, Cal., where he will open an assay office and chemical laboratory.

W. DURBROW and E. KRUG of Nevada City, are under engagement with a San Francisco mining syndicate to go to mines in South America. Mr. Durbrow will be manager and has appointed Mr. Krug Supt. of one of the mines.

R. H. CAMPBELL, formerly of Shasta county, now of Harper's Camp, Cariboo, B. C., where he is sinking the deepest shaft ever sunk in Cariboo, is in San Francisco to buy mining machinery therefor. He will also put in a complete sawmill outfit and a steamer to ply on Horsely lake.

PROF. NICHOLSON of the School of Mining and Metallurgy of the University of Nebraska, has been authorized under the title of Director of the School of Mining and Metallurgy to bring together into defined courses the work now given in the University pertinent to mining and metallurgy, and to arrange for the enrollment of students therein.

W. A. SCOTT, staff correspondent of the MINING AND SCIENTIFIC PRESS, is now on one of his periodical tours of Arizona, and, as usual, will contribute a series of interesting articles on the development, production and equipment of the mining industry of that Territory. Managers and superintendents of mines, mills and smelters who can accord Mr. Scott facilities for getting proper data, or show him other courtesies as this paper's representative, will do a favor that will be appreciated by the publisher.

#### Obituary.

JOHN F. DALY, a well-known mechanical engineer of San Francisco, Cal., died at his home in Alameda, Cal., on the 17th inst. Mr. Daly was a native of Maine, 48 years of age, and had lived on the Pacific coast for twenty-five years. He was a pioneer inventor and builder of gas engines and had been for several years secretary of the Union Gas Engine Co. Death was due to brain fever.

#### Commercial Paragraphs.

THE Stilwell-Bierce & Smith-Vaile Co. of Dayton, Ohio, has contracts for fifteen complete pumping outfits for Shanghai, China.

THE Austrian Government has recently placed large orders for dredgers, shovels and other machinery with the Marion Steam Shovel Co., Marion, Ohio.

IN a drilling contest which recently took place at the carnival held at Leadville, Colo., Edward Malley and James Chamberlain of that place won the world's championship and a \$750 prize, establishing the indoor record of 4½ inches in Gunnison granite, the drills used being made of Firth's best tool steel. Their friends are confident that with outdoor work they would make even a still better showing.

AT Los Angeles, Cal., the Kern Power Co. plans to use the water power of the Kern river country and supply electricity for a large portion of southern California; capital stock, \$5,000,000. Amount subscribed: H. E. Huntington \$1,400,000, I. W. Hellman \$380,000, A. Borel \$380,000, C. De Guigne \$380,000, W. G. Kerckhoff \$1,110,000, A. C. Balch \$580,000, H. W. O'Melveny \$210,000, A. Haas \$275,000, Kasper Cohen \$275,000. All except the last two named are directors.

THE Llewellyn Iron Works, manufacturers of the New Standard concentrators, Los Angeles, Cal., have recently furnished New Standard concentrators as follows: Four at the American Girl G. M. Co., Ogilby, Cal.; two at the Con. Golden Trout M. Co., Oroville, Cal.; six at the Hoosier Boy mine, Prairie City, Or.; one at the Mountain Chief mine, Wickenburg, Ariz.;

opposite sides of the form and hold it firmly upon the cylinder. The impression roller has yielding journal-boxes, so that the pressure upon the form can be readily regulated.

### New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING NOVEMBER 12, 1901.

686,391.—PRINTING PRESS—J. F. Ames, Portland, Or.  
 686,432.—ALARM WHISTLE—Bowen, Barnett & Newham, Los Angeles, Cal.  
 686,441.—CAPSTAN—T. G. Cantrell, S. F.  
 686,385.—STEAM MANGLE—Casper & Gerder, Sacramento, Cal.  
 686,398.—SHAVED ICE PERFORATOR—E. G. De Ry, Seattle, Wash.  
 686,447.—FLY TRAP—F. W. J. & W. Fritsch, Sedro Woolley, Wash.  
 686,381.—STOMACH PUMP—W. Gerry, Ventura, Cal.  
 686,691.—WELL CASING PERFORATOR—E. A. Hardison, Los Angeles, Cal.  
 686,396.—WHEELBARROW—O. Hoffmann, Portland, Or.  
 686,657.—MATCH BOXES—J. W. C. James, Portland, Or.  
 686,521.—OILING CABLES—C. Larsen, Crockett, Cal.  
 686,314.—BOOT DRIER—H. C. Mansfield, Chico, Cal.  
 686,417.—EASEL SUPPORT—A. B. Murray, San Rafael, Cal.  
 686,471.—SPEED GEAR—J. M. Ough, S. F.  
 686,373.—BOOK BINDING—B. F. Welker, San Miguel, Cal.

### SITUATIONS WANTED.

ASSAYER WANTS POSITION AT A LARGE gold mine. Thoroughly competent, with wide experience as assayer at copper, silver and gold mines. Now assayer at big mother lode mine. Address R. A. A., care of Mining and Scientific Press.

POSITION WANTED BY A MAN WHO HAS technical education and twelve years' experience in metal mining; seven years as superintendent. Speaks Spanish. Best of references. Address H., care Mining and Scientific Press.

WANTED.—A position by a first-class all-round millman. Understands amalgamating and concentrating and care of mills. Twenty-five years' practical experience. Arizona or Mexico preferred. Satisfactory references given. Address "Millman," care Mining and Scientific Press.

MINING ENGINEER, graduate Mass. Inst. Tech., with thirteen years' experience as miner and surveyor for large copper company in Montana; superintendent of coal mine, washer and coke oven plant and railroad in South for six years; in charge of zinc property in Missouri; familiar with concentrating methods; at present in charge of cyanide operations of tailings pile in California, desires position with reliable company. Open for engagement after October 15. Address S. J. M., care Mining and Scientific Press.

### WANTED.

Wanted, to Rent or Lease an Assay Office Complete in San Francisco.

State terms and particulars. Address "Business," care this office.

WANTED.—Tailings (Gold) in Washington, Oregon, Idaho, Montana, Dakota, Wyoming, Utah, Colorado, New Mexico, or British Columbia.

Address full particulars to Miner, Box 102, Los Angeles, Cal.

### WANTED.

Developed and Partly Developed Gold and Copper Mines.

Full expert reports, maps and 90 days' exclusive options must be furnished. Have CASH CUSTOMERS for worthy properties.

## ASSESSMENT NOTICES.

**NATIONAL CONS. MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of November, 1901, an assessment (No. 15) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 23rd day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. W. FLEISSNER, Secretary.  
Office—773 Mission street, San Francisco, California.

**ORLEANS CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of November, 1901, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 324 Pine street, Room 10, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 30th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. P. THURSTON, Secretary.  
Office—324 Pine street, Room 10, San Francisco, California.

**LARKIN MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of November, 1901, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

N. F. REMINGTON, Secretary.  
Office—112 Main street, San Francisco, California.

**MORICAN MINING & MILLING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of November, 1901, an assessment (No. 2) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 300 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3d day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
JNO W. CLASSEN, Secretary.  
Office—No. 300 California street, San Francisco, California.

**THE CALIFORNIA DREDGING COMPANY.**—Principal place of business, 120 Sutter Street, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of October, 1901, an assessment (No. 3) of \$10 per share was levied upon the capital stock of the corporation, payable immediately in gold coin, to the secretary of the corporation, at the office of the company, 120 Sutter street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on MONDAY, the 25th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of December, 1901, to pay the delinquent assessment, together with the cost of advertising and expenses of sale.

SAM. W. CHEYNEV, Secretary.  
120 Sutter Street, San Francisco, California.

**AMERICAN OIL AND REFINERY COMPANY.**—Location of principal place of business, San Francisco, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of October, 1901, an assessment of five (5) cents per share was levied upon all the subscribed capital stock of the said corporation, payable immediately to J. C. Anthony, secretary of said corporation, at its office, at room No. 323 of the Parrott building, Nos. 825 to 855 Market street, in the City and County of San Francisco, State of California.

Any stock upon which this assessment shall remain unpaid on the 25th day of November, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 23rd day of December, 1901, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.  
J. C. ANTHONY, Secretary.  
Office—Room 323, Parrott building, Nos. 825 to 855 Market street, San Francisco, California.

## DELINQUENT SALE NOTICE.

**THE THORPE MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Fourth Crossing, Calaveras County, California.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 11) levied on the 8th day of October, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Names.                    | No. Cert. | No. Shares. | Amt.   |
|---------------------------|-----------|-------------|--------|
| Mrs. Kate B. Hoffman..... | 74        | 400         | \$4.00 |
| Mrs. Kate B. Hoffman..... | 75        | 400         | 4.00   |
| Mrs. Kate B. Hoffman..... | 160       | 256         | 2.56   |
| Mrs. Kate B. Hoffman..... | 237       | 154         | 1.54   |

And in accordance with law, and an order from the Board of Directors, made on the 8th day of October, 1901, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 632 Sacramento street, San Francisco, California, on MONDAY, the 9th day of December, 1901, at the hour of 1:30 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. F. FREY, Secretary.  
Office—632 Sacramento street, San Francisco, California.

**Money savers in first-class Engines, Boilers, Pumps, Hoists, Dynamos, Pulleys, Pipe, Hangers and Shafting. L. PETERSON, MODEL MAKER,  
544A MISSION STREET, bet. First and Second Sts., SAN FRANCISCO. Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

## Addressing Readers Personally.

Advertisers who avoid or neglect the use of the pronoun "You" overlook a colloquial element which is both easy and effective in operation. Whenever an advertisement is being read some individual is in front of it. Under these circumstances, why should not the advertiser's message be delivered as from man to man? Take the case of an advertiser who is employing space in a widely circulated weekly journal like the MINING AND SCIENTIFIC PRESS, and who is prepared to give his advertisement a few minutes' attention every week. Let such advertiser jot down from time to time the strongest arguments that he can think of why his goods should be purchased—such arguments, for example, as he or one of his travelers would use when addressing a prospective purchaser. Let him then imagine once every week that he has such prospective purchaser standing in front of him, and let him write down in a few terse sentences precisely what he would say to such a person, using the pronoun "You" in the colloquial style while doing so. There would be a freshness, an originality, and a vitality about a weekly talk of this kind, conducted through the columns of so well circulated a paper, which would quickly make its mark, and yield the advertiser who adopted the practice a satisfactory profit.

## Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines OUR SPECIALTY.

—WE BUILD—

### GOLD DREDGES Complete in Running Order

to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

SEND FOR DREDGING CATALOGUE NO. 17.

—WE ALSO BUILD—

### ALL KINDS OF

Mining, Milling, Concentrating,  
Pumping, Air Compressing,  
Hydraulic, Water Wheel,  
and Hoisting Machinery.

Evans Hydraulic Gravel Elevators.

—We publish sixteen catalogues. Write for one in the line you are interested in.—

## TANGENTIAL WATER WHEELS

MANUFACTURED BY

RISDON IRON WORKS,  
SAN FRANCISCO, CALIFORNIA.

We build Water Wheels for any head and for any power. Complete electrical power generator wheels a specialty. Large wheels up to 50 feet diameter for driving compressors.

SEND FOR CATALOGUE NO. 4.

## "THE DANIEL BEST"

# 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,  
16 TONS EACH,  
or a total capacity of train,  
48 TONS.

CAPACITY  
OF  
ENGINE,  
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.

Estimates made for complete Steam Freighting Outfits. Address

# PATENTS

DEWEY, STRONG & CO., San Francisco, Cal., and Washington, D. C.

We are prepared to transact business with our clients direct from either our San Francisco or our Washington office. We have representatives in every country in the world having patent laws. The information accumulated through long and careful practice before the Patent Office and the frequent examinations of patents already granted, for the purpose of determining the patentability of inventions submitted to us, enables us to advise inventors, often saving them the expense of applying for a patent upon inventions which are not new. All worthy inventions patented through us are described in the *Mining and Scientific Press*. Guide to inventors sent on application. Address

DEWEY, STRONG & CO., 330 Market St., San Francisco, Cal., or 918 F St., Washington, D. C.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

THE EDWARD F. ALLIS CO., Milwaukee.  
FRASER & CHALMERS, Chicago.

SUCCESSOR TO

GATES IRON WORKS, Chicago.  
DICKSON MFG. CO., Scranton.

MANUFACTURER OF

## Mining Machinery

There are  
reasons  
why

the adjustable and practically indestructible GATES ROCK AND ORE BREAKERS produce crushed material at a much lower cost per ton than other breakers. To more than 5,000 users located in all parts of the world, the cause is readily apparent. Gates Breakers not only have much greater capacity, require less power, run without vibration, stoppage or delay, with less wear on the crushing surfaces and permitting carloads of material to be dumped directly into the hopper of breaker, thus reducing the employment of handling devices and manual labor to the minimum, but other convincing reasons supported by indisputable evidence of the superiority of Gates Breakers are given in Gates Catalogue No. 1. Avoid a false start and possibility of failure. There is absolutely no breaker made that will compare with the "Gates."

We are prepared to build crushing plants complete, screens and perforated metal of all kinds, elevators, hoists, engines, and boilers. We also build cement machinery of the latest designs. ESTIMATES FURNISHED UPON APPLICATION.

New type; new illustrations; new matter; better than ever; reduced in price to \$1.50 postpaid to any part of the world. The practical character of this book has made it the favorite everywhere in the mining world among men who want such a manual on assaying.

Address Book Dept. Mining and Scientific Press,  
330 MARKET ST., SAN FRANCISCO, CAL.

## EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeanesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeanesville Pumps.

We claim that in Jeanesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

# THE MAP SHOWS--

The shaded part shows that where the most metal mining is done the MINING AND SCIENTIFIC PRESS has the largest part of its circulation. It tells its own story. The MINING AND SCIENTIFIC PRESS is the only mining paper that has a general circulation therein.

Every advertiser in the MINING AND SCIENTIFIC PRESS, whether he pays for an inch or a page, knows that he weekly talks to the men who do the buying. He knows his audience just as sure as though he could look into their faces or shake hands with them. He knows that his announcement is weekly seen by the men throughout this west half of America who are thoroughly representative of the great metal mining industry of the country.

The readers of this paper have bought mining machinery and supplies to the extent of over \$150,000,000 in the last ten years, and their annual purchases now exceed \$18,000,000. Its advertising pages are referred to everywhere by intending purchasers of mining machinery or supplies as a directory for that purpose. The paper refuses questionable advertising, and its thousands of readers learned long ago, to their satisfaction, that the appearance of an advertisement in its columns is of itself good

evidence of reliability. An advertiser in this paper is in good company.

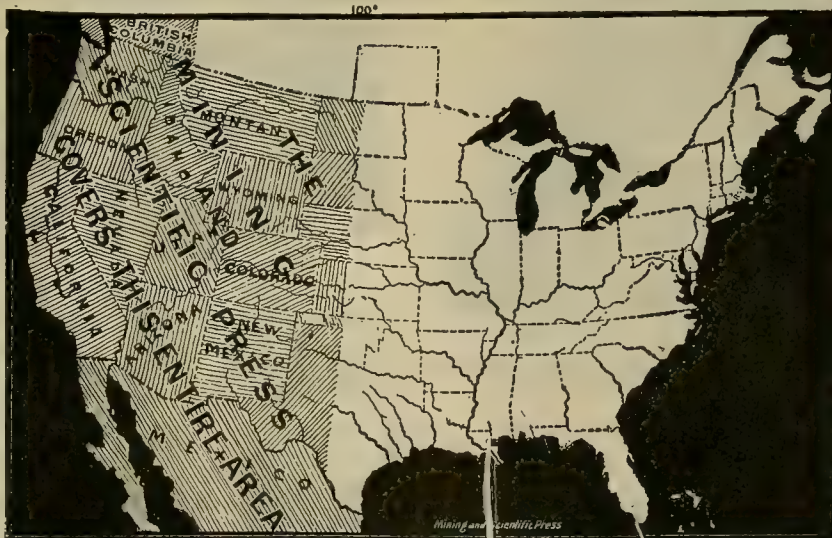

In advertising, results are what count. It is not what an advertisement costs, but what it produces, that determines its value. Leading concerns

who continuously buy advertising space herein, say that it is not an experiment, but a profitable investment to advertise in the MINING AND SCIENTIFIC PRESS. Its rates, comparatively, are "cheaper" than those of any other similar publication. "Cheapness" is not regulated by what you pay, but by what you get for what you pay. Advertising in this paper, if properly backed up by what is advertised, insures profitable publicity.

The region shaded on the map has a POPULATION OF TEN MILLIONS --- MINING IS ITS CHIEF INDUSTRY.

No advertiser who sells to mining men would omit using this journal if he knew the truth about it.

If from any reason anyone thinks "Advertising doesn't pay," we would like to furnish him with evidence that the right kind of advertising does pay. Economy in advertising is like economy in everything else—judicious expenditure of money. The results of an advertisement are what determines its value.

## MINING AND SCIENTIFIC PRESS,

330 MARKET STREET,

SAN FRANCISCO, CALIFORNIA.

**PACIFIC COAST RUBBER CO.,**

21 FIRST STREET, SAN FRANCISCO, CAL.

**Corrugated Pneumatic Hose.**

Made absolutely seamless in the fabric as well as in the cover. So constructed as to form, practically, a compact body. No splitting of the tube and opening of the plies, much lighter and more pliable, and will stand shorter bends without kinking than hose made in the ordinary way; will withstand a greater air pressure than any hose double its weight offered on the market. We guarantee this hose to outwear any other style or make of hose for the conducting of air under pressure, whether for drills, hoists or pneumatic tools, and we are satisfied, beyond any doubt, that for this work it is by far the most desirable and economical hose manufactured.

Plain; Wound with Flat or Round Wire; or Covered with Woven Marline Jacket. Sizes 3-8, 1-2, 3-4 and 1 Inch.

**JOHN TAYLOR & CO.,**

63 First Street, SAN FRANCISCO, CALIF.

—IMPORTERS AND DEALERS IN—

The above cut represents our Portable One-Stamp Mill opened for cleaning, or to take apart for transportation. It can be run by hand or belted for power.

Total weight of mill.....405 lbs.  
" " upper half.....205 "  
" " lower half.....200 "

Price \$100. Write for special illustrated circular.

## Trade Paper Advertising.

It is very easy to go wrong in the matter of trade paper advertising. One temptation is to go into several without much reference to their circulation, stability, value, influence, or reliability, but there is hardly ever more than one paper in a trade that is first rate as an advertising medium. Since it is the leading paper in that trade, it is apt to reach nearly everybody of consequence in the business, whereas the circulation of the others, or of most of them, is likely to be largely a duplication. There are apt to be several very good reasons why that particular leading paper is the leading paper. It has the right kind of matter in it or it wouldn't be subscribed for so generally. It is usually on a firm foundation, and hence it conducts all of its affairs purely on a business basis. No fear, no favor; the same treatment for all, and that fair business treatment. All this, besides giving a publication the effective support of the trade—by means of which it is enabled to make money and to be independent—also gives the publication a character for reliability which helps the advertising as well as the reading matter—helps to make the advertising interesting, helps to make the reader think that the advertising is true. Another mistake that some make in reference to the trade paper is that they just put in a card—any old thing will do, you know—and let it go at that. The space that they buy is their own. Why shouldn't they make the best possible use of it, then? Why shouldn't they take pains with the preparation of their copy? Why shouldn't they change the matter often, perhaps in every issue? Why shouldn't they assume that the reader of the paper in question will follow the advertising pages generally, and their own advertising matter in particular, if there is live, fresh news in them?

An ANALYSIS of the Coal, Fuel Oil, Lubricating Oils, Boiler Compounds, Greases, Cleaning Compounds, Building Materials, Brasses, Metals and other substances or preparations you may be using, will sometimes open your eyes and save big money.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## SMOOTH-ON IRON CEMENTS

For stopping leaks and pitting in marine boilers, for boiler patching, for repairing leaks and fractures in steam and hydraulic work, and for repairing blemishes in iron or steel castings. These cements are prepared in powdered form and applied by mixing with water; when hard they will withstand a red heat, steam, water or oil, and expand and contract the same as iron. Write for illustrated catalogue and prices; when ordering state for what use.

EXPENSE SAVED INVENTORS BY  
PRELIMINARY SEARCHES.

COMMUNICATIONS CONFIDENTIAL.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports since 1793, with full copies of U. S. Patents since 1872. As a result we are able to give reliable advice as to the patentability of an article, frequently saving the inventor the cost of an application. Our Washington branch tends exclusively to our business before the Patent Office. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, including filing of Caveats, Trade-Marks, Copyrights, Labels; prepare Assignments, Licenses and Agreements; give Opinions on Patentability and Infringements, etc. Circulars free on application.

## Brunton's Pat. Pocket Mine Transit.

1-3 ACTUAL SIZE.

The engraving herewith illustrates Brunton's  
Pat. Pocket Mine Transit as it appears when  
folded ready for the pocket.

The working parts are enclosed by an aluminum  
case, the outside dimensions of which are but 2 1/2 x  
2 1/2 inches and the total weight but 8 ounces.

There are over two hundred of the above instru-  
ments in daily use at the present time, and those  
using them unite in pronouncing them the most  
convenient, accurate and reliable pocket instru-  
ments on the market. Send for Catalogue B9 to

### If You Doubt P & B Roofing==

If you doubt P & B Ready Roofing, write to us for our booklets and state in your letter exactly what you want the roofing for—the kind of a building, the character of roof, the climatic conditions, etc

We will be pleased to write you in full about P & B Ready Roofing.

We will tell you exactly why P & B Ready Roofing will fit your purpose—tell you what it is made of—how it can be laid quickly and with small cost—how many square feet of it you will need and what the total cost will be.

For over 16 years P & B Ready Roofing has been used by the best builders everywhere for covering all sorts of buildings and we know it is the only ready roofing that has given complete satisfaction in every case.

# IT IS TO GRIND

THE SMIDTH BALLMILL

## AN EXPERT OPINION.

L. S. Russell of Lansing, Mich., of the Bureau of Labor and Industrial Statistics of Michigan, has recently completed a tour of investigation of the Portland cement industry of his State. He is particularly enthusiastic over the Omega Portland Cement Company's plant at Jonesville, Michigan, which he terms "the really model factory, where everything is run on a perfect system."

"Cement," Sept. 1901.

The entire output of the Omega plant is finished in SMIDTH BALLMILLS AND DAVIDSEN PATENT TUBEMILLS. Further comment is unnecessary

Nos. 38 to 44 Fremont St., San Francisco, Cal.

## THE JEANESVILLE Miners' Sinking Pump

HAS THE FOLLOWING ADVANTAGES:

It is designed especially for the roughest and most exacting service.

It is particularly adapted for gritty water.

It is very strongly and yet compactly built, so as to occupy as small a space as possible.

It can be operated in any desired position, either vertical or horizontal.

This pump is an improvement in many ways over other makes of sinking pumps.

The cap under the Plunger is fastened with Hinge Bolts, one bolt retaining the cap after the rest are released. Also providing Priming Valves in the Water Valve Chest Cover to prime the Lower Valves from Column Pipe, and they are so close as to be in no danger of breaking off.

We have thickened, and thereby strengthened, the wall of water passage leading from lower end of plunger. We have also strengthened the form, without adding materially to the weight of the connecting piece opposite the water passage. These have been weak points in other sinkers.

All parts commonly made of brass, such as water valve seats, valve stems, valve springs, etc., are made of Phosphor Bronze.

All parts are made to gauge, so that they can be easily renewed.

Parts for repairs will interchange with Cameron Sinkers of the same size.

**MORAN FLEXIBLE JOINTS.**

Simple. Efficient. Durable.

All Metal Construction.

Positively Tight Under Any Pressure.

Applicable to Steam, Air, Water, Oil.

## THE HALLIDIE ROPEWAY

For Transporting Ore, Fuel, Earth, Sugar Cane, etc., by Wire Ropes

**SIMPLE, ECONOMICAL, PRACTICAL, DURABLE.**  
**LOADS MECHANICALLY. DUMPS AUTOMATICALLY.**

**WIRE TRAMWAYS (Single and Double Rope Systems),**

CABLEWAYS, TRANSMISSION BY WIRE ROPES, CABLE GRIPS,

INCLINE PLANES, LOGGING BY CABLES, AUTOMATIC LOADERS,

**PLOWING, SCRAPING AND TRANSPORTING by Wire Ropes,**  
**DESIGNED, SUPPLIED AND ERECTED. Estimates Furnished.**

AGENCIES: Hendrie & Bolthoff, Denver, Colo.; Scott-Strevell Hardware Co., Salt Lake City, Utah; George A. Lowe Co., Ogden, Utah; P. Basche, Baker City, Oregon.

**CALIFORNIA WIRE WORKS,**

**Improved GRIP PULLEY.**

Patents Nos. 483,442; 610,353.

**EFFECTIVE, SIMPLE, AUTOMATIC.**  
Saves Wear on Wire Rope and Cable.

Send for Illustrated Pamphlet.

Correspondence Solicited.

**17-19 Fremont St., San Francisco, Cal.**

## The Head of a Mining Ditch.

The illustration on this page shows the head flume of the old Amador canal where it takes the water out of one of the branches of the Mokelumne river in Amador Co., Cal. The Amador canal is one of the comparatively few of the old California mountain ditches originally built for placer mining which have survived the closing down of the hydraulic mines. Nevada, Placer, Sierra, Butte and Plumas counties particularly have hundreds of miles of abandoned ditches and broken-down flumes—disappearing monuments of one of the most unique and intense mining activities that the modern world has known.

Most of these old hydraulic construction works in the localities where most evidence to the eye—the region of the mines—were ditches excavated on high mountain slopes, close to the summits, or on top of the broad, flat summits themselves. There was little attempt at fancy construction, just sufficient work being done to get the service. Wherever practicable, the water itself was made to cut its own channel. The flume constructions were generally most prominent at the heads of the lines, at the bottoms of the mountain canyons. Here there is no earth or easily excavated rock, and the slopes are so precipitous that it is difficult even to find footing for the flumes. In some places these have been built on iron brackets set into the face of vertical cliffs. There has been at least one instance in which they were suspended by ropes. There is an occasional instance of a half tunnel being blasted out of a rocky face to make a flume footing.

The condition depicted in the illustration is not uncommon—the canyon at the head, where the water is taken into the flume boxes, so narrow that there was not space for the water flow in the stream and the line of boxes. In this instance this particular difficulty is partly got around by making the head boxes much smaller than the main line and giving them considerably more grade. The loss of grade was of no consequence. The saving of flume construction made by it more than compensated. The small boxes carried a small cross section of water at high velocity, the quantity of flow being sufficient to fill a large ditch when the canyon widened out.

## A Light Steam Hoist Mine Rig.

A mine is very seldom found so ready made that from the beginning the appliances and equipment generally can be planned and installed for the maximum operation of the mine for a term of years. The mine, as a rule, has to grow. It is a discovery first—a piece of quartz with a speck or two of gold, or a piece of rock which shows well-known metal-bearing minerals of commercial value. The prospector then, with this discovery of a trace, in place or as float, locates the ledge or deposit and proceeds, by stripping of the surface

Head of Amador Canal, South Fork of Tuolumne River, Cal.

Steam Hoist Rig, Petticoat Mine, Near Railroad Flat, Cal.

and the sinking of shallow holes, to determine the surface limits of a payable ore body. If it prove sufficient to justify the next step—of determining depth—the prospector runs a tunnel or sinks one or more shafts. For the latter, recourse is had for hoisting, first to a hand windlass, next to a horse-power whim, or, as an alternative, a cheap water-power rig of the type described and illustrated in last week's issue of this journal.

This prospecting work, if the property develops in the direction of becoming a mine, ultimately outgrows its infancy, and the capacity of the several types of hoisting plants employed during this period, and its first steam hoist equipment as a mine is of the simple and comparatively inexpensive type illustrated on this page. This rig is the old installation on the Petticoat mine, near Railroad Flat, in Calaveras county, Cal. The plant has an upright boiler and 15 H. P. single cylinder hoisting engine. This type of plant still has a portable character. It is not a loss if a mistake has been made as to the mine. It can be removed and set up at another mine. It is of moderate capacity only and its effective range of work does not run much above 400 feet in depth. It does very well for small mines or the beginning of large ones, occupying a position in the economy of the industry about midway between the types of plants special and typical of prospecting operations and the great hoisting plants of the large mines into which the small ones grow.

## Lesson of the Smuggler Mine Fire.

The death last week of twenty-four miners in the Smuggler mine at Telluride, Colo., from the smoke and gases of a fire burning the mine buildings which covered the tunnel mouth, makes the discussion of the prevention of such accidents in future timely. It is by no means the first of its kind, though in this instance the loss of life is noticeably large. About ten years ago three men lost their lives in the old Belmont mine, near Ophir, Cal., through the burning of the hoisting works building over a 300 foot deep shaft. The men were at work in a level distant from the shaft. No one was in the building at the time the fire started, so far as known, from the blacksmith shop. The smoke and gases were drawn down the shaft into the workings. The air pipe becoming heated by the fire at the surface started an up cast draught from the bottom of the mine, taking out the good air of the mine and causing it to be replaced rapidly by the smoke and fire gases. In this mine there was no other escape except through the shaft. Had there been another outlet to the surface it would have become a down cast, supplying pure air to the mine, as well as providing the opening for escape of the men in the mine.

In the Smuggler mine accident there were other outlets which enabled many men warned in time to escape. But the ventilation of the mine would seem to have been so arranged that they acted as an up cast, drawing in the smoke and poisonous gases. While human foresight could not foresee what has happened it should be able to prevent the recurrence of a similar accident.

It may be accepted that the starting of a fire cannot be absolutely insured against. The remedy would then appear to be protection against the dangerous effects of the fire if it does come. For a mine worked through a shaft, a second shaft at a safe distance from the working one is a safe protection. With the mine worked through a tunnel like the Smuggler, other outlets through workings above the tunnel may be cut off by the smoke before, as in this instance, warning can be given. This is particularly liable to happen if there are workings below the tunnel level.

It would seem, however, that a perfect protection can be given by a branch outlet tunnel leaving the main working tunnel at from 50 to 100 feet from the portal and coming into the open clear

of all buildings, or, indeed, anything that can catch fire. The portal of this branch should even be protected by masonry instead of timbering. At the point of branching there should be doors in both outlets, or one door so arranged that it can close either of the ways. With the main way open for regular mine working and the branch way closed, in the emergency of a fire in the tunnel building closing access to it and driving smoke and gases into it, the latter can be shut off by closing the door reached through the branch from the outside. With the clear opening made and the smoke and gas thus shut out of the mine, there can be no danger to the men.

## A Formula for Reservoir Losses by Evaporation.

City water supply problems, where there is dependence in whole or part on reservoir storage from rainfall, are complicated by the necessity of taking evaporation into account. While the elements that enter into the problems are indeterminate, they have generally been reduced to formulas with the notable exception of evaporation.

Evaporation is a function of the reservoir surface, and its rate or depth of water taken per day or month varies with the temperature and degree of saturation of the atmosphere. Records have been kept of evaporation running through a series of years, from which average rates in particular localities for convenient time intervals have been established. Possibly some further work done in this direction may make such averages more reliable by making them less empirical. The reservoir surface is, however, variable, concerning which little examination has been made toward the construction of a formula for evaporation.

In the employment of a reservoir storage for city water supply, more particularly in California where the year is divided into wet and dry seasons, the inflow in the wet season exceeds the sum of the draft of consumption and loss by evaporation; and the water rising, the surface spreads out and increases, and in the dry season the sum of the draft of consumption and loss by evaporation exceeds the inflow of water and the area of reservoir surfaces diminishes. The draft of consumption and rate of evaporation are both at their minimum in winter when the inflow is at its highest.

Let  $r$ ,  $r^2$ ,  $r^3$ , etc., represent the values of the rate of evaporation in decimals of a foot for successive time intervals for which the rates have been obtained by experiment and record.

Let  $s$ ,  $s^2$ ,  $s^3$ , etc., be the mean values in square feet of successive areas of water surface during the corresponding time intervals for which the rates  $r$ ,  $r^2$ ,  $r^3$ , etc., have been determined.

Then the evaporation for a given period of time is the sum of  $r \times s$ , plus  $r^2 \times s^2$ , plus  $r^3 \times s^3$ . With this aggregate for one year, and the total quantity drawn off for city service for the year, the sum of the two becomes the available run-off of the watershed or catchment area for that particular year. This method here suggested would give more accurate data for evaporation and available run-off than any approximate methods.

The practice, so far as the writer is advised, is to aggregate the rate or depth of evaporation for several months of the year, and estimate an approximate mean area for the reservoir surface during the same period. With these, the annual amounts of evaporation are estimated. The results obtained prove less than the fact, as shown by the results of estimation by the method that has been suggested as being more exact. It might be said that the lower and doubtful result, both being approximate, if used as a factor in other estimations concerning water supply, does not result in a prejudicial error. It is true it may not, but, on the other hand, it can become the underlying cause of serious errors that represent large commercial values.

If the determination be made in the first instance for small reservoirs, and catchment areas, that provide within a limited range of extremes the storage necessary to fill the reservoirs every winter or wet season, and if the use of the results be confined to estimations for those particular reservoirs, or ones of similar capacity and other common elements, the error is not material and would not be suspected.

But if the results so obtained from these small

reservoirs are made the basis of the estimation of projects for very much larger reservoirs, where the surplus storage of several years is estimated on to make up deficiencies of storage of another series of years, the error of underestimation by multiplication may become so serious as to affect materially the commercial side of the projected works.

The evaporation, when determined for known water surfaces in such city supply storage reservoirs as are being continually drawn on, has a percentage ratio to the total run-off of the catchment areas, which is smaller as areas of reservoir surface decrease, and larger as they increase. In reservoirs which in capacity very largely exceed the run-off of the average seasons, it is possible to have the surface so large that the percentage of the annual run-off that is wasted in evaporation approximates 100%. In other words, there is a limit of surface area of such a storage reservoir beyond which the net run-off, after deducting evaporation, contributes nothing further. The storage can grow no greater. It does not require argument to sustain the proposition that the dam construction should stop far short of providing a surface area to the storage water that the net run-off could not increase.

In projecting such a storage reservoir, using an underestimate of evaporation, determined as noted above from comparatively small reservoirs, the structure of the dam can readily be given dimensions in excess of what would be commercially justifiable with a correct estimate of evaporation.

THE rich placer strike made near Mormon Island and Folsom, in Sacramento county, Cal., is another illustration of a good mine missed by the old miners. Mormon Island was a big placer mining camp in 1849. In 1869 the writer recalls it as given over to the Chinese, who were reworking the tailing piles of the 1849 miners. Its former brief glory is not even a memory to the present generation, and few of the old miners who worked at Mormon Island are still alive. The new discovery would appear to be a re-discovery of the old channel of the American river at this point. The miners who worked out Mormon Island in the early days knew nothing of channels. Gold was where they found it, and when they did not find it they moved on. Their successors for years have accepted this ancient verdict of condemnation. It has remained for farmers to find the mine the miners missed. The incident of farmers finding mines has been common enough in the last twenty years in California to base expectations for its recurrence. It is hardly probable that this last discovery will prove very extensive. It is likely only a remnant that, missed in the old mining, is found now. But it does not exhaust the possibilities of the vicinity of Folsom that await discovery. In strongly calling attention to them, an investigation has been started that may lead to the opening up to exploitation of a dozen or more new old mines.

THOSE of our readers who do not keep a file of the paper are urged to do so, as in no other way can they better get answers to questions that are constantly coming up. The matter is referred to because weekly are received questions for answers in "Concentrates" that have received recent answer therein, and when the inquirer is referred to that issue the reply often comes "I have lost or mislaid my copy of that date." The possessor of a volume of consecutive issues of this paper has an epitome of the latest and best in mining, metallurgy and mechanics, up-to-date and of greater value than anything found in books. This is not stated as an opinion or meant in any way other than the noting of a fact often expressed by readers everywhere. The value of such a paper is enhanced by the possession of a file of its weekly issues, as one little item in it has often been found to be worth ten times the cost of the paper for the entire year. The paper will be bigger and better than ever in 1902, and now is a good time to begin keeping a file of it, advertisements and all, for reference.

THE railroads running out of Cripple Creek, Colo., have announced a flat rate of \$1 a ton on all ores regardless of value. This is exactly as it should be, a freight rate uniform for all kinds and grades of ores. Other railroads could adopt the policy with advantage both to the miners and to themselves.

## Concentrates.

THE Madison county, Mont., rate of miners' wages is \$3.50 per day.

New copper plates will absorb gold to the amount of one-half pennyweight per ton of ore milled.

It is generally a good plan to file an amended location certificate when applying for a U. S. patent to a lode claim.

THE Russian Ural platinum mines supply 95% of the world's product of that metal, and last year produced 11,989 pounds.

SO FAR AS KNOWN, the only manufacturer of aluminum in the United States is the Pittsburg Reduction Co. of Pittsburg and Niagara Falls, to whom samples of the clay may be sent.

SOME of the noise in a stamp mill can be overcome by covering the tappets with wooden or leather shoes, as it is the impact between the cams and tappets that makes the most of the din.

VISITING and transient mining men can avail themselves of the facilities of this office in the way of current mining literature, etc. Mail matter may also be forwarded in care of this office.

THE amount of water used in the sluice should be four times the amount of gravel washed. If 10,000 cubic yards are run through per day, the daily requirement of water is about 900 miner's inches.

TURQUOISE gets its fine light blue color from alumina, not copper. Its composition is alumina, 46.9%; water, 20.5%; phosphoric acid, 32.6%. It is two and a half times heavier than equal bulk of water.

THERE is no advantage in mixing black powder and dynamite or "giant powder" in a blast. They can not be well or economically used together in that way, as black powder needs tight tamping and dynamite does not.

BALL MILLS are deemed of value in dry crushing of gold ores, where the pulp is to be treated by leaching processes, where concentration is the chief method of beneficiation, or where the sliming of tellurides is to be avoided.

MINE TUNNELS in which it is proposed to use electric haulage should have a clear height well over the head of a man walking, so that he is in no danger of making a contact with a trolley wire and receiving the electric current.

WHERE a miner is in any danger of becoming leaded, an occasional mouthful of water, to each pint of which has been added two drops of chemically pure sulphuric acid, will help to neutralize the bad effects of the lead fumes or vapors.

IN Mercur district, Utah, the consumption of cyanide averages  $\frac{1}{2}$  pound per ton of ore treated, and the consumption of zinc  $\frac{1}{2}$  pound per ton, being about 2.2 pounds of zinc to each ounce of gold recovered. The cost of milling is about 50 cents a ton.

AN expansion engine is any engine in which the steam at full pressure does not follow the piston for the whole stroke, but is cut off at some specified point, allowing the steam to drive the piston to the end of the stroke under a decreasing pressure.

THERE is no loss of State or Federal legal rights by failure or neglect to record an affidavit of annual assessment work; but such filing may save considerable trouble and expense later on. Increase in value of a mine or prospect always invites litigation.

THE purchase or sale of a mine in California requires the consent of two-thirds of the issued capital stock. This can be given by resolution in a stockholders' meeting, or a written consent signed by the stockholders can be attached to the instrument of conveyance.

THE Wetherill magnetic separator is a device for separating and purifying such ores as are attracted by an electro-magnet. It is built on correct scientific principles and is worthy of favorable consideration. It has a good record for commercial success in practical work.

AFTER \$500 work or improvements, whether in five months or five years, has been put on a mining claim, it is patentable. The whole cost of subsequent securing of a patent should not exceed \$250. The fees should be reduced to one-half what they are now, as a matter of justice.

THERE is no "inspector of mines" in California, nor is it likely there will be soon. The California State Mining Bureau has several men examining and reporting on various mining developments in different parts of the State, but inspection or supervision of any kind is not among their functions.

CUPELLATION is an ancient metallurgical process, having been well known 2500 years ago. Recent discoveries at Silchester, England, also show where a silver refinery was operated there by the Romans, argentiferous copper being cupeled on hearths made of boneash in the era about 300 A. D.

THE California State Courts have ruled that stock companies must issue new certificates to stockholders who can prove that they have lost their certificates. The judgment of the Court ordering the issue is held to protect the corporation against the reappearance of the lost certificate.

THE only occurrence in the United States of phosgene that is known to "Concentrates" is in the Terrible

mine, Iise, Custer county, Colo. It is a chloro-carbonate of lead, consisting of carbon dioxide, 8.1; chlorine, 13; lead oxide, 70.9. It occurs in the locality mentioned in cleavable masses associated with cerussite.

TUNNEL DRIVING through soft rocks, such as marls, shales and sandstones, is now being considered by engineers as possible of accomplishment by specially devised electrically driven drills, which will, in one cutting, make the entire heading, 8 or 9 feet in diameter, and do more rapid work than at present accomplished by the use of explosives.

QUARTZ VEINS frequently have different angles of dip at different depths. A solid vein at the surface is often found scattered in stringers beneath, and the reverse is noted. It is a good plan to drift on a bunch of seams cut by a tunnel about where the ledge ought to be. The seams may be found to close in and becoming solid identify the ledge.

TWO CYANIDE PROCESSES are in use in the Black Hills. In one, the "wet" process, the ore is crushed in the ordinary stamp mill battery in the cyanide stock solution; in the "dry" process the ore passes from the crusher through the rolls and in a dry state is immersed in the cyanide solution. From 80% to 92% of the value of the ore is extracted.

CEMENTED GRAVEL carrying gold, in which the cementing material is a tough, hard clay, is best broken up and washed in a pan. The gravel stones, as they become free, assist in the working of the clay into suspension in the water. Any clay left in sticky masses is sure to carry off gold. Once the gold is free and settled beneath the sand and gravel, it can be saved without special difficulty.

A BALL dropped from any considerable height will strike the earth to the east of the vertical line in which it started. As it drops, it maintains the velocity of motion toward the east which the point had from which it started. As it approaches the earth, it comes to a point which has a slower velocity than the starting point, and will, therefore, be moving to the east faster than is the place it strikes.

TUNNEL WORK may count as annual assessment work, even though the mouth of the tunnel and much of its course is not on the claim; but it must "head" for the vein on the claim to which it is intended such work shall apply. If so, and written consent is obtained from the owners to pass through other claims between the tunnel entrance and the claim headed for, there should be no difficulty.

THE only way in which an electric appliance can benefit the body electrically is by producing electrical energy capable of doing work upon the body. There must be a source of energy in the appliance, and that source requires to be renewed from time to time, as the energy produced by it becomes exhausted. Any electric appliance, therefore, which professes never to need electrical renewal is a fraud.

MOLYBDENITE is the ore from which molybdenum is produced. It is not used on the Pacific coast. Concentrated, it is worth, delivered, \$200 per ton. It is found in El Dorado, Fresno, Inyo, Nevada, San Diego, Kings and Tulare counties, Cal. It is a soft, metallic, scaly, foliated mineral, of glossy lead color, and is the sulphide of molybdenum. The Bethlehem Steel Co., Bethlehem, Pa., can answer any question about its commercial use or value.

SUPERHEATED STEAM is obtained by the addition of heat to saturated steam. In behavior it resembles fixed gases. It is a bad conductor of heat and has the special peculiarity of being able to lose a certain amount of heat without becoming saturated steam again. Very little heat is required to superheat steam, but as it loses heat as rapidly and easily as it gains it, all the pipes carrying superheated steam must be well protected with some non-conducting covering.

THE engineers of the Southern Pacific R. R., surveying for a tunnel through the summit of the Sierra Nevada mountains, have found impracticable the proposed route tunneling through from Donner lake, Cal., on the Truckee side into Soda Springs valley, on the North Fork of the American river, on the Sacramento side. The difficulty was with construction below Soda Springs valley toward Emigrant Gap, Cal. They are now surveying a route from Donner lake under Summit pass into the canyon of the South Yuba river, Cal.

THERE are many good reasons for adopting the metric system. As a business proposition, it would pay. It might be a little confusing for a while, but so is any new thing, however good. A meter is 39 inches; it is as easy to think of an inch being one thirty-ninth of a meter as to think of its being one-twelfth of a foot. It is no harder to think of a 39-inch standard than of a 36-inch one. The system is based on the decimal system, as is our United States currency. The calculations and work of the world will be carried on in decimals sooner or later.

CYANIDE is a compound of cyanogen with a metallic agent. Cyanogen is a colorless, poisonous, liquefiable gas which has the odor of almonds and burns with a purple flame. Cyanide of potassium is made by burning potassium, an alkali metal, in cyanogen gas, and is really a prussiate of potash. It is produced also in blast furnaces in which ore is smelted, with coke or coal, and is prominent when kept dry, but decomposes rapidly in moist air. It crystallizes in dry, octagonal blocks, and is ex-

tremely soluble in water. It has the odor of prussic acid and kindred bitterness of taste. Besides its interest to miners and metallurgists in the cyanide process, cyanide of potassium is also used in electro-metallurgy and photography to a considerable extent. It will remove metallic oxides, the juices of fruits and indelible ink.

IN a belt-driven electric generating and transmission plant in which the prime mover power is steam, the losses will aggregate on an average about 40% of the theoretical steam power, leaving about 60% recoverable in work from a motor. In a water power direct-driven plant, with the electric generator on the water wheel shaft, the losses aggregate just about the same. The steam engine, on the average, can be made to produce a higher percentage of efficiency than the water wheel, the gain offsetting the loss of the belt transmission. These figures refer to average good practice.

IF one person goes upon the mineral lands of the United States and either establishes a settlement or works thereon without complying with the mining laws, and relies exclusively upon his possession or work, and a second individual locates peaceably a mining claim covering a portion of the same ground, and in all respects complies with the requirements of the mining laws, then such second party is entitled to the possession of such mineral ground to the extent of his location as against the prior occupant, who is from the time said second party has perfected his location and complied with the law a trespasser.

THE fault with the silvered plates may be imperfect amalgamation at the start. A good way is to scour them with a mixture of wood ashes and fine sand, such as had passed through a No. 80 screen. After cleaning the plates with water, mercury should then be rubbed in with a mixture of sal-ammoniac and wood ashes, the plates then left with this mixture on them for twelve hours. At the end of that time silver amalgam will be seen in little patches all over the plates. This is to be rubbed in with a little more mercury, which concludes the operation. Thus treated, silvered plates should work well and last a year. For some months they may require little attention beyond sprinkling a little mercury over them after the daily clean-up and rubbing it well in. Subsequently a daily wash with a solution of sal-ammoniac has been found beneficial.

TO USE a large quantity of water under a very high head for power development, if a single line of pipe be projected, requires a large diameter and a very great thickness of metal. This means a very high cost. As an alternative to the single line, the common practice is to use two, three or four lines of pipe of lesser diameter. A considerable economy of metal and cost is effected. There is still a third scheme that can be considered particularly when the power pipe line is of considerable length. This consists of dividing the head into two or more sections with a corresponding number of power stations. The single pipe line is cut into sections. A very considerable economy can be made of metal and cost. The offset to this is the cost of the one or more added power station buildings and the wages of added employees. There is no difference in the machinery installation except its division into two or three parts.

THE most commendable system is to follow, as closely as possible, the ore in sight, and if the ore gives out, and the showings, all things considered, seem to justify further exploration, the work should be confined as nearly as possible to the proximity of the point where the ore body was disclosed and extracted. This increases the probabilities of finding other ore bodies and curtails much unnecessary dead work incident to conducting other exploratory work. In the early stages of exploration the inclined shaft, following the dip of the vein, is usually the best plan to adopt, as it affords opportunities to examine the ground being developed and also because it is generally cheaper to sink such shafts than vertical shafts outside of the vein formation. This, however, is not invariably the case, as the country rock is sometimes softer than the vein matter and sometimes when the vein is wide, the filling is broken and difficult to sink in. Water in the vein is also sometimes a drawback, but, as prospect work, to follow the vein if possible is the most commendable. When it has been satisfactorily determined that the vein and the ore shoot being opened carry well in depth and the topographical features are such that the mine cannot be economically opened by tunnels, then the vertical shaft, with crosscut drifts to the vein, affords the safest and best plan for extensive operation and the introduction of cages and other appliances that tend to facilitate mining and which cannot be as successfully employed in an inclined shaft. The latter shaft should be sunk from 250 to 500 feet on the vein to demonstrate the features of the vein and levels should be run to determine the extent and value of the ore bodies in the shoots before undertaking to sink a vertical shaft. Sometimes a mining claim, being the extension of a developed mine, bears considerable prospective value, from the fact that the ore shoot, opened in the developed property, bears, or trends toward this claim. If this is the case, and the shoot is tenacious and of considerable magnitude and value, it is a safe undertaking to sink a vertical shaft on this claim to intersect the shoot at the most favorable point the trend and dip indicate. Such undertakings have in many instances resulted in opening valuable mines which were devoid of favorable surface showings. Generally the character of exploratory work should be determined by the locality of the ore body to be prospected, and by local topographical features.

Written for the MINING AND SCIENTIFIC PRESS  
by RALPH L. MONTAGU.

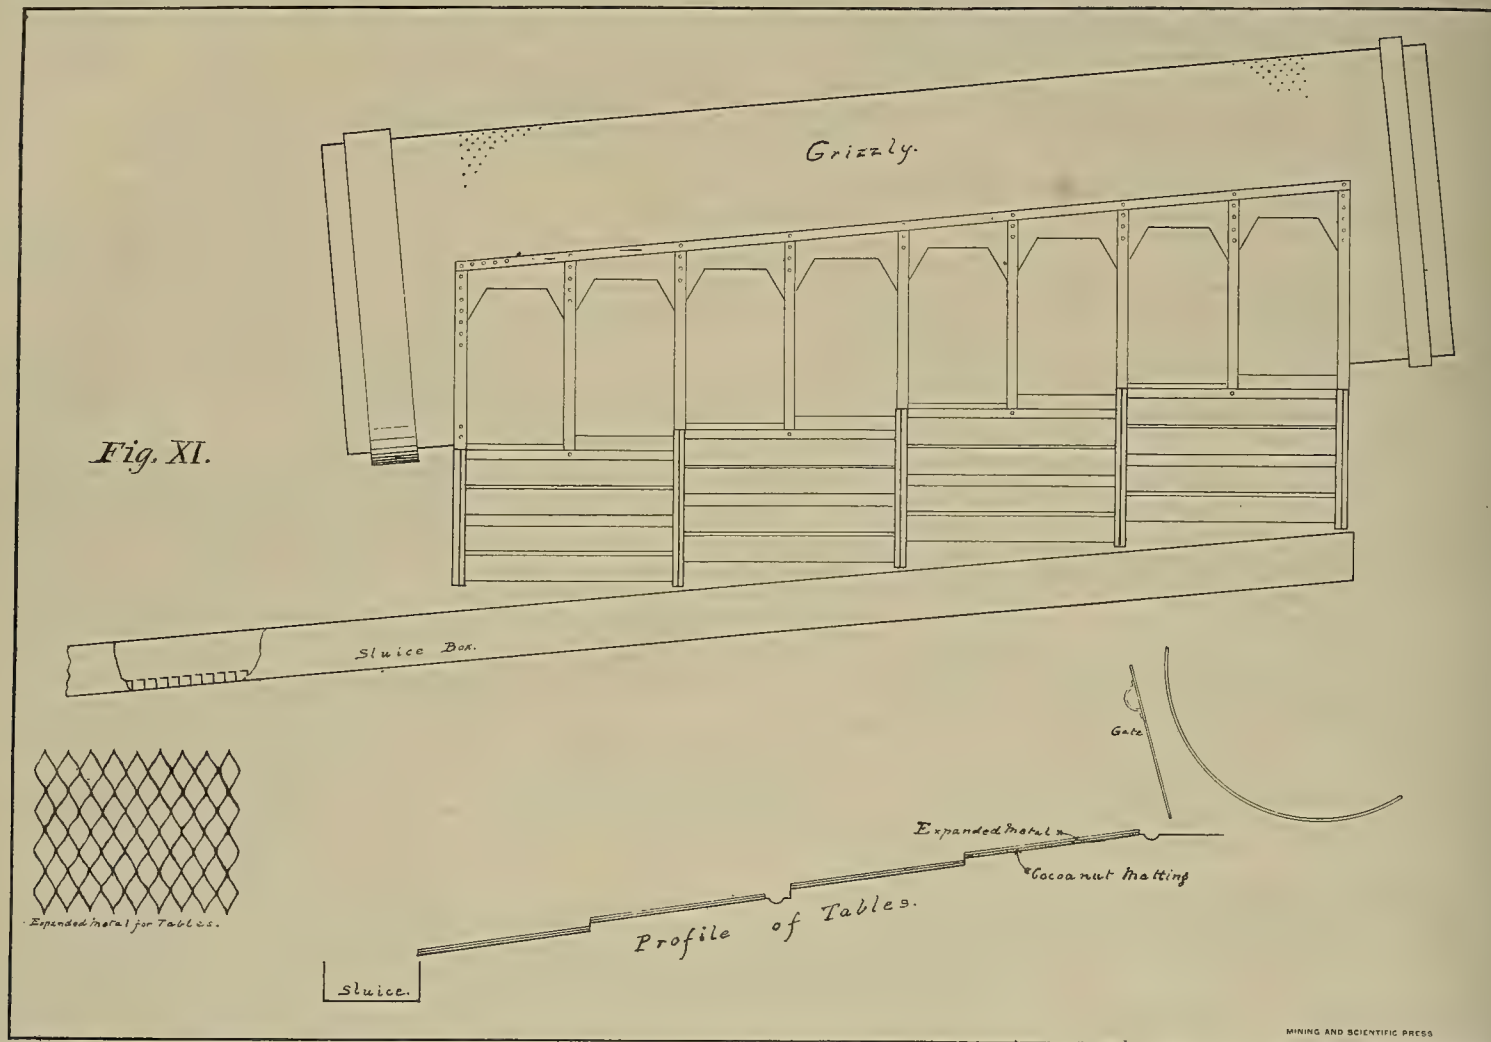

On these dredgers (Fig. 5) the gravel is screened very fine and is run over tables (Fig. 11), where

and run through the sluice box in the ordinary manner. It will be found that the black sand settles first in ridges between the edges of the plates, and finally the entire sluice box will be 1 or 2 inches deep with black sand carrying the gold. The ordinary river sands, having no iron in them, are not caught by the plates.

When it is necessary to clean up, a box can be

and better way is to have a box of say 15 cubic feet made. If this box is made of wood, it should be caulked perfectly tight. Swing this under the dumping end of the sluice box, and when it is nearly filled with gravel remove it.

Drain the water off and carefully measure the gravel contained and pan down. Presuming a value of 1 cent per cubic yard is got, to this must be added

cocoanut matting is overlaid by a network of expanded metal. From the tables the material is carried by small sluice boxes to the sand pump. The riffles in these sluice boxes are made of angle iron, as shown.

In some localities the gold is so extremely fine that it is impossible to separate it from the black sand. A loss of considerable magnitude will be experienced if any of the preceding methods of saving gold are tried in this case.

I have designed a special sluice box for this purpose, which collects all the black sand and incidentally the gold, without collecting any of the other sands. There are no riffles in the sluice box, but into the bottom plates of soft iron are let in (Fig. 12).

placed at the lower end of the sluice, the magnetizing current is cut off and the black sand, etc., is swept down into the box. It can then be sacked and shipped to smelters.

It is a good idea, where this method is used, to have two or three special sluices side by side, with a gate arrangement at the upper end, so that the water and fine gravel can be cut off from one sluice for the short time necessary to empty it of black sand. Practice will show how often it is necessary to empty the sluices in order to get the best results.

Most dredgers use electric lights and the dynamo which supplies these can be increased in capacity so as to furnish current for the magnet; or, where alternating current is supplied to operate the

the percentage of boulders in the gravel which do not pass through the sluice box. Supposing this to be about 10%, we are losing 1 cent per 1.11 cubic yard, which is .9009 of a cent per cubic yard. A number of tests should be taken and an average obtained from them for the figures to be of any value.

The amount of material handled by the dredger should be carefully measured; the value of the gold saved and that lost per cubic yard should be compared with the prospected value of the ground; the difference is the gold that is left on bedrock. It has already been stated that a dredger will not clean a hard, rough bedrock cut up by deep crevices.

**THE ELECTRICAL EQUIPMENT OF A DREDGER.**—Throughout a large area of the mining districts good fuel is quite expensive, but frequently this condition is met by an undeveloped water power or a local system of electric power transmission.

There are two distinct systems of electrical energy that are used for transmitting power, the direct and the alternating current systems. Where the distance from the source of the power to its delivery is less than 3 miles direct current should be used, but above that distance the alternating current is more economical.

In a direct current system the current is supposed to flow through the wires forming the circuit in the same direction continuously, i. e., at the positive (+) terminal and returns at the negative (−) terminal.

The current in the alternating system flows alternately back and forth, i. e., the current starts from one terminal, being received back at the other and then reverses.

One complete forward and backward flow is called a cycle; an alternating current is described as being of sixty cycles. This means that there are sixty complete cycles per second. Sometimes the same current is styled 7200 alternations. This means that there are 7200 alternations of current per minute.

The units used in measuring electrical energy are the volt, which is the unit of pressure or potential difference, and the ampere, which is the unit of the amount or intensity of flow of current.

The product of these two factors (amperes and volts) is known as watts. A watt is the unit of power (746 watts = 1 H. P.).

To those who are acquainted with hydraulics an analogy can be drawn between the volt and the pressure per square inch, and the ampere and the cubic feet of water per minute. A flow of water of 1000

These plates are flush with the bottom of the sluice box. Attached to these plates on their under sides are electro-magnets. These magnets should be made of soft iron, so that when the magnetizing current is cut off they quickly lose their magnetism.

The polarity of these plates is so arranged that the north pole is surrounded by south poles, and vice versa. The gravel must be screened very fine

dredger, this current can be changed to a direct current by a rotary converter.

The amount of sand that can be collected in one of these special sluices is in proportion to the strength of the magnetizing current, up to a point known as the saturation point. Beyond this the further increase of magnetizing current weakens the magnet.

When the tailings are tested to find out the percentage of gold not recovered, it is not much good to scratch on the surface and pan the dirt. An easier

cubic feet per minute at a pressure of ten pounds per square inch would produce the same power as a flow of 100 cubic feet per minute at a pressure of 100 pounds per square inch. Likewise a current of 1000 amperes at 100 volts pressure would represent the same power as a current of 100 amperes at 1000 volts pressure. In the hydraulic case the pipe to carry the water in first case would have to be considerably larger than in the second case, but the strength would not need to be as great as in the second case, where a greater pressure had to be withstood.

In the electric problem the wire would be, in the first case, ten times the cross section of that used in the second case, but the covering (insulation) in the second case would have to be better able to withstand the higher strain of the increased voltage. From this it will be seen that in order to transmit power a distance by electricity economically, the current strength (amperes) should be small and the pressure (volts) great.

In order to deliver 100 H. P. at a point 5 miles distant through the medium of direct current, 550 volts pressure, the copper in the line would weigh 67,457 pounds, the efficiency would be 90%. With alternating current 5000 volts the same power could be delivered at an increased efficiency, i. e., 94% over a line the copper of which would weigh only 3945 pounds.

The direct current does not lend itself to transformation, and owing to facts that it is not necessary to enter into here, it is not practical to build a direct current generator of higher pressure than 1000 volts. (The commercial standard is 550).

On the other hand, alternating currents can be readily transformed from currents of large amount at low pressure to currents of small amount and high pressure, and vice versa.

A transformer, which is used for this purpose, consists of a magnet with two coils of wire wound on it. These coils, which are not electrically connected with each other, are known as the primary and the secondary coils. In a case where it is necessary to convert a large amount low pressure current into a small amount high pressure current, the primary coil would consist of a few turns of a wire of large cross-section; the secondary coil would, on the other hand, consist of a coil with a great number of turns of wire of small cross-section.

This is called a step-up transformer; a step-down transformer, which reduces the high voltage to a lower and practical level for the operation of motors, is located at the other end of the line. Transformers require little or no attention, as there are no moving parts; the principal cause of depreciation, which is slight, is the general weakening of the insulation which separate the wires from one another. The following table shows approximately the difference in cost of a direct and an alternating current transmission system to deliver 1 H. P. at a point 5 miles distant from the source of power:

| Dynamo transformers.       | Copper in line.  | Total.           |
|----------------------------|------------------|------------------|
| Direct.....\$14 04 @ H. P. | \$134 91 @ H. P. | \$148 96 @ H. P. |
| Alternating 32 04 @ H. P.  | 7 89 @ H. P.     | 39 93 @ H. P.    |

In equipping a dredger with electric motors considerable attention must be paid to the class of work done by the machinery that is driven by each individual motor. It is not good engineering to have one large motor, which through a system of belting, gearing and countershafts drives several different pieces of machinery, although this is done on a number of dredgers.

Where direct current is used there are two distinct types of motor, viz., the shunt wound motor and the series wound motor.

The shunt motor is wound with two distinct circuits. A fine winding of a great number of turns is used on the magnets, the terminals of which are connected directly to the mains, and a heavier winding is placed on the armature in series with which is an external starting resistance or rheostat. (Fig. 13).

on the magnets and then through the armature winding. (Fig. 14).

The shunt motor is capable of maintaining a practically constant speed irrespective of the variations of load; the following test showed a constancy of speed to within 1 1/2% for all loads within the working limits of a small motor.

| H. P. at brake. | Rev. per min. | Torque.<br>(Pounds-feet). |
|-----------------|---------------|---------------------------|
| 1.1 .....       | 1,125         | 5.15                      |
| 7.4 .....       | 1,120         | 33.4                      |
| 10.36 .....     | 1,115         | 48.8                      |
| 11.14 .....     | 1,110         | 53.0                      |

For driving such machinery as revolving grizzlies, shaking screens, centrifugal pumps, stackers or belt conveyors, where the load is steady and a constant speed is desired, a shunt motor should be used.

In starting a shunt wound motor the switch is closed and by the motion of a movable arm the external armature resistance is generally cut out of the circuit. This armature resistance prevents a sudden rush of current through the motor. A parallel may be drawn between the action of cutting out resistance and the gradual opening of the valve of a steam engine.

For driving the bucket chain and the winch where a variable speed is desired, and where, as in the case of a bucket chain, a powerful starting torque is necessary, the series motors are installed. The speed of a series wound motor is in proportion to the work it does. A further variation can be obtained in the speed of the motor by introducing resistance into the circuit. The series wound motors are started, stopped, reversed and their speed is varied by means of a device called a controller, similar to those which are in use on electric street cars. It is, unfortunately, practically impossible to obtain the same variations of speed with a motor as can be done with a steam engine; therefore when very great differences of speed are required, as are called for by the winch, although a motor can be made to give two or more distinct full speeds, it is better to introduce a differential gearing which will accomplish this object.

I am in favor of having the motor that drives the winch geared directly to it, instead of using a belt, which has been known to come off at a critical time.

Motors should also be installed which have a margin of load over and above the work they have to do; I have found by practice that 20% is sufficient; i. e., a motor that would have to produce 100 H. P. should have a full-load rating of 120 H. P. This adds to the first cost, but there is then no danger of the motor being destroyed by temporary overload, and the life of the machine is considerably lengthened.

An ammeter, a machine which measures the intensity of the current, should be placed on each motor circuit. It is a very poor policy to save a few dollars and dispense with these instruments, as is done in a number of cases. A volt meter should also be connected across the mains; this instrument shows the difference of potential between the mains.

Safety devices which consist of lightning arresters, fuse blocks or circuit breakers should never be omitted. A lightning arrester is a device in which there are two metal or carbon points separated from one another by a small air gap. One of these points is connected to one of the wires and another to the ground. When lightning strikes the overhead pole line instead of going to the motors and destroying them, it jumps across the narrow air gap onto the metal point connected to the ground, and does not cause any damage.

A fuse block consists of introducing into the circuit a short length of an easily fused alloy; when through any cause a heavy rush of current (sufficient to destroy the motor) takes place, the alloy melts and opens the circuit and cuts off the electric current.

A circuit breaker accomplishes the same thing but by a different method. In this device the wire carrying the current is wound round an electro-magnet

rent strength reaches a certain point the attractive force of the magnet overcomes the spring and, drawing the armature to it, releases a catch that allows a spring switch to open the circuit.

Circuit breakers are used on direct current systems for breaking heavy currents. For an incandescent or arc light circuit fuse blocks are sufficient. Fuse blocks are used almost entirely on alternating current systems. The Westinghouse Electric Co. manufacture a fuse block in which the fuse is completely enclosed in a lignum vitae case. When the fuse burns out all danger of fire is thus removed.

## Mountain Roads.\*

By JAMES W. ABBOTT.

INTRODUCTION.—It may be stated as a general proposition that practically every mountain road west of the Missouri river has been built to meet a need arising in some way from the existence of mineral deposits. The prospector, with his crude tools, blankets and simple food packed upon his faithful burro, goes ahead. In his business neither roads nor trails are necessary or specially desirable. He finds the mineral, the news gets abroad, and others flock in to try their luck in the newly explored region. Then comes the trader with supplies, men to buy, and miners to work the new finds. The freighter with his mule team furnishes transportation, and for his use are built the first mountain roads. The motto is, "Get there and get there quickly." The first desideratum seems to be a route over which vehicles on four wheels can travel without tipping over. It is often so steep in places that wagons can only be pulled up with blocks and tackle, and descend with wheels rough locked and dragging a heavy log behind.

Next come roads to particular mines, toll roads, county and State roads, each case usually affording ample latitude and scope to the actual ignorance or bad judgment of men of all grades of supposed road cunning. There is not a mining county or a mountain county (the terms may be considered synonymous) from the eastern base of the Rocky mountains to the Pacific coast where the money squandered in traveling over bad roads would not in five years build new ones intelligently located and properly constructed.

But the saving to existing enterprises would be only a small part of the advantage to accrue to any region from such a betterment of its road system. The expansion of the mining industry everywhere is due principally to the development of ore bodies of low grade but abundant quantity, where processes involving the strictest economy and most careful saving at every step yield in the aggregate a slight margin of profit. Hundreds of thousands of tons of ore are mined and treated where this margin is less than \$1 a ton. The saving of a few cents a ton on ore down to the mills and a corresponding saving in freight charges on fuel, provisions and other supplies up to the mines means in the freight item alone a very considerable percentage on a large capital to companies producing hundreds of tons a day.

Throughout this great region thousands of deposits now lie idle which, with roads properly constructed, will become available, furnishing a new, vast market for labor, mining machinery and farm products, and benefiting directly or indirectly every industrial and financial enterprise in the United States.

But mountain roads must not be considered alone from industrial or utilitarian standpoints. The inspiring, health-giving effects of mountain air and mountain scenery are universally conceded. For those living in them, and for those who come to them for business, pleasure or health, the need for roads which can be traveled in safety and comfort is just as imperative as it is elsewhere. In all the older settled regions of the country the sentiment which demands good roads is increasing with marvelous rapidity. This should not and will not halt at the foot of the mountains.

The conclusions as to practice presented in this paper, formed by the writer during twenty-five years largely spent in building and operating mountain roads, have been modified or confirmed by much conference with men of large experience and well-digested views on the subject. They are offered in the modest hope that in the criticism which may be elicited, the records of experience which may be presented by others, and the careful study of the subject which is now going on, better methods in mountain road building will result.

The suggestions are intended to meet the conditions existing in Western mountain counties, where population and means are usually quite limited. They relate to a standard for road building which, while not elaborate or expensive, is certainly attainable and would be far in advance of prevailing average practice.

GRADE, THE KEY TO CORRECT METHODS.—The key to all correct methods of mountain road building is grade. It is generally expressed by percentage. A 1% grade means a rise of 1 foot for each 100 feet of horizontal distance traveled. There are 5280 feet in

\* From Year Book U. S. Department of Agriculture for 1900.

In a series wound motor the current goes through a variable resistance, then through a heavy winding

which attracts an armature towards it; a tension springs holds this armature back, but when the cur-

a mile. Hence a 1% grade means a rise of 52.8 feet in that distance, a 2% grade a rise of 105.6 feet, and a 10% grade a rise of 528 feet.

The proper grade in each case must be determined by the conditions and requirements. For bicycle travel a 2% grade can be ascended with comparative ease and descended with little effort. Heavier grades, up to 5%, are practicable for this purpose when unavoidable. They can be ascended by the average bicycle rider without extremely arduous effort and descended without serious danger. Grades above 5% are too steep for ascent with comfort or descent with assured safety.

For pleasure driving the grade, where practicable, should not exceed 4%. A good horse with a light buggy and two persons will trot easily up a 4% grade and as easily down without a brake. With a higher gradient the strain in either direction becomes increasingly apparent.

For freight traffic the maximum grade admissible is 12%. Four animals, together with the one or two wagons used on a mountain road, are all that one driver can safely and properly handle on steep grades. When he uses two wagons, lead and trail, at every stop ascending he must hold both wagons by the brakes on the lead. In descending with heavy loads, excepting when the roads are icy, he must control his wagons with brakes on both—the lead by the lever beside his seat, the trail by a strap leading to the brake lever. When the road is icy he must control the descent by rough locking one or more of his rear wheels. To rough lock, he attaches some rough device, like a piece of chain, or a short steel runner, grooved on the upper side to fit the tire and with projecting prongs on the lower, to the felly of a rear wheel, just in front of the point where it rests upon the ground. A chain attached firmly to the center of the forward axle is then tightly fastened to this rough lock. Thus secured, as the wagon descends the hill the wheel remains rigid and the rough lock plows into the surface of the road.

Experience in heavy freighting has shown that wagons can be actually and satisfactorily controlled in all weathers on 12% grades, but that they can not be thus controlled on steeper grades, and that where heavy freighting has been attempted on steeper grades it has almost invariably been attended with terrible accidents. In freighting on any grade the weight and number of wagons will depend upon the proportion between material to be hauled up and freight back. On a properly constructed dry road four animals, averaging 1300 pounds each in weight, will haul 6500 pounds, total weight, distributed between wagons and contents, up a 12% grade at the rate of about 1½ miles per hour. Descending, the four animals will haul all that a wagon can hold up, but in practice this amount rarely exceeds 16,000 pounds on a single wagon, or 20,000 pounds on a lead and trail, and the average is probably not much in excess of 10,000 pounds on one wagon, or 14,000 pounds on lead and trail. When roads are icy heavy wagons tear up a roadbed badly.

But while 12% grade is admissible as a maximum, roads of lighter grade are so much more efficient and satisfactory in every way that only the gravest necessity should ever determine the maximum at 12%.

Mountain roads are routes of travel between points of different altitudes. The most common, as well as the most serious, mistake made in their location is the attempt to cover this distance by too short a line. On a 12% grade every pound of freight going up is elevated 12 feet for each 100 feet of horizontal distance traveled. On an 8% grade it is elevated 12 feet in 150 feet of horizontal distance traveled, while on a 6% grade it is elevated the same amount in 200 feet of horizontal distance. Or, in other words, the distance required to get a 12% grade must be increased one-half for an 8% grade and doubled for a 6% grade. Tables have been published giving the comparative weights which a horse can pull on different gradients; but, so far as the writer knows, no actual statistics have ever been compiled which show what would be the difference in performance in actual freighting between good roads of different gradients. The limit of load which a team can pull on any road is determined by the steepest place in that road. It is rare that a mountain road is built on which the maximum gradient is less than 12%. It is also true that there are very few places where mountain roads have been constructed that it was not feasible to secure a maximum under 12%. The extra length that would be required is generally much less than one would at first suppose. Roads built on a continuous uniform grade are very rare. Many seem to go up steep places just for the sake of going down again, thus giving a grade adverse to the heaviest traffic, which ought never to be compelled to climb a foot in descending a mountain. So far as the writer's study and observation have extended, 99% of all the roads built for heavy mountain traffic might have had a maximum under 12%. It is putting it very moderately to say that a team will haul up 50% more load in the same time between two given points on a road with an 8% maximum than it could haul on one of similar surface with a 12% maximum.

Besides the advantage in upfreighting, the 8% road possesses many favorable points which are liable to

be lost sight of. It is vastly safer for both light driving and freighting; on passenger vehicles brakes, while desirable, are not essential to safety; with heavy loads, if the brake fails there is a fair chance of escape for driver, team and wagon. Such a road is not seriously damaged by rain and melting snows, which work such injury on steeper grades; damage from rough locking is enormously reduced, and as such practice can be to a great extent avoided the time thus consumed is saved. Repair bills on wagons and harness are lessened, and the life of wagons is greatly prolonged. It is a pleasure to drive down an 8% grade, as it produces a sense of exhilaration which most people find agreeable. As gradients become steeper the sense of danger grows more and more keen. The writer believes that 8% is the gradient to be aimed at where important differences in elevation are to be overcome, and that such gradient can generally be secured. As a rule, in such cases a lower gradient means too long a route without commensurate advantage, while a higher means an unnecessary loss in the very purpose for which the road is required. The maximum adopted in the old Government pike crossing the Alleghanies was 7%.

**IMPORTANCE OF LOCATION.**—Next in importance to grade is location. The worst obstacle encountered on mountain roads is snow. The snowslide, or avalanche, comes sweeping down the mountain side, carrying along everything it meets and depositing its accumulations when the momentum is exhausted. The customary routes of these slides are generally quite apparent to the practiced eye of the mountaineer. In laying out a mountain road one can sometimes avoid a snowslide track by crossing to the farther side of the gulch. Sometimes it is possible to put the line so high that the snowslide will always stop beneath it. If a snowslide covers a road, it is rarely practicable to clear it for heavy traffic for months. The accumulation of ice, snow, rocks, trees and debris of all kinds is so enormous, and the cost of removing it during the cold, short days of winter so excessive, that a snowslide generally remains where it falls until nature lends the chief aid in its removal. In roads designed for heavy traffic, it is the wisest economy to avoid snowslides at almost any cost.

Next to snowslides in destructive effect are snowdrifts, due to air currents. These act with remarkable uniformity from year to year. The places where these drifts accumulate in excessive amount can generally be located and avoided by careful attention. Deep ravines almost always catch snow. In a snow region it always pays to go around a point by a side-hill grade in preference to cutting through it.

The track of a waterspout must be carefully noted and an ample waterway provided. These result from currents of air due to physical outlines, and generally recur in the same places. They always leave abundant evidence by which their courses may be located.

Always locate roads on slopes facing south and east in preference to slopes facing north and west. These afford the sun greater power to settle and melt the snow.

A sidehill gives a better road than a creek bottom. It is always better drained and generally has a more solid foundation.

The matter of crossing streams should receive the most careful study. Bridges are costly to build and expensive to maintain. The writer recalls a mountain road that originally crossed the same stream sixteen times in the first 2 miles. This number has been reduced from time to time until now only two crossings remain.

Very steep sidehill slopes and hard rock increase the cost of road building. It is often possible by study to avoid them to a greater or less extent. It was a favorite expression with a very successful man that "Nothing pays like first cost in road building," meaning that money expended in intelligent study of a location was the most economical item of all the cost. Most problems in road location that at first seem impossible of practical solution can be solved.

**OBJECT OF DRAINAGE.**—In level regions we drain roads to protect their foundations; in the mountains we drain them principally to protect the surface. Water naturally runs off from a slope, and in doing so it must always leave more or less effect. Every mountain road must run through a valley or along a hillside. If in a valley, the surface should have a crown of at least 6 inches, with gutters and ditches and drains just as in properly constructed roads in a level region. In mountain roads on hillsides, on the other hand, a very different practice must be adopted. The outside of the road must be the highest, with the view of conducting the water as quickly as possible toward the inside bank, where it should find a gutter to carry it to the nearest drain. This prevents the water from spilling over and washing away the outside bank, and also has a tendency to keep it from running down in the ruts and enlarging them. There is a vital reason for keeping the outside of the road on hillside grades higher than the inside. There is always a tendency for the wheels of a heavily loaded wagon to slough toward the lower side. This becomes very serious when the road surface is slippery, and terrible accidents have happened. Rain or melting snow always wears down some of the material from the inside bank. If the road surface

slopes outward, this debris follows the drainage across the road, continually increasing the slope, sometimes very rapidly in cold weather; hence the roadbed, for the protection of both the bed and the traffic, should be constructed and maintained with an inward slope of at least ½ inch to the foot. The inside gutter should empty into drains crossing the roadbed diagonally at suitable intervals, determined by the amount of drainage.

**NECESSITY FOR PROPER BATTER.**—The importance of batter in mountain road building seems to be little understood, and correct practice is almost universally ignored. It is very common to see hillside grades constructed as follows: Insecure cribbing with a vertical face, constituting the outside of the roadbed; the inside bank cut as nearly vertical as possible, and three-quarters of the entire width of the road perhaps built of material filled in, the filling generally including all the trash available (boughs, sticks, boulders, etc.), with a covering of such material as the bank affords; width, in such cases, barely sufficient to hold a wagon when the road is first built. The destructive forces of nature act vigorously on such a roadbed from the start. Ice and water rapidly wear down the inside bank, and the debris falls upon the roadbed. The trash foundation settles and the road sinks, sloping outward. Water finds its way through this loose material and undermines the roadbed, making holes, or invisible death traps. The cribbing settles, rots, and soon disappears altogether. Unless such a road is practically rebuilt in a few years it grows more and more dangerous, and finally becomes absolutely impassable. The above is no fanciful sketch, but an accurate description of practices and conditions to be found almost everywhere in mountain regions.

(TO BE CONTINUED.)

#### Machinery and Wages in the American Steel Trades.

At one time in the United States a roller in a rail mill, rolling iron or steel rails, received about 15 cents per ton, turning out from 75 to 100 tons per turn. To-day on some of the modern steel rail mills less than 1 cent per ton is paid for doing the same work, and yet by the end of the year the roller in the rail mill to-day can make as much money as he did when he received the above higher prices under the old method of working, and that, too, with less physical labor.

At one time 45 cents per ton were paid for heating iron for making iron rails. To-day, through the use of the improved methods, very little more than ½ cent per ton is paid for doing the same work—making steel rails—and yet the wages received per month or per year are as good, and better, to-day than they were at that earlier time.

One of the most remarkable results in this direction recorded in the history of iron and steel is the price paid for rolling wire rods. At one time, about twenty years ago, a man having charge of a rod mill received \$2.12 per ton of rods made, out of which he paid no help whatever. At that time twelve to fifteen tons were considered a good day's work. To-day it has become almost common practice to make 200 tons of wire rods in a single turn; and upon the basis on which rod rollers are paid to-day, they would not receive much more than 12 cents per ton. This, however, enables the roller of to-day to make as much money as the roller did twenty years ago, producing only twelve tons per turn.

About twenty years ago 80 cents per ton were paid for heating billets to make wire rods; to-day 5 cents per ton are commonly paid, and the daily wage is higher than it was when 80 cents per ton were paid.

If some of the rollers now employed at the Homestead Works of the Carnegie Steel Company, rolling structural steel, were paid the same wages per ton that were paid twenty years ago they would be receiving from \$200 to \$250 per ton on a single day's work. On the same basis, if rod rollers to-day were to receive the same per ton that they received twenty years ago, viz., \$2.12, then for a turn's work of 200 tons they would receive \$424 per day, or single turn.—William Garrett, in Cassier's for December.

The Gunnison-Montrose tunnel in Colorado is projected through the Cerro range to divert the waters of the Gunnison river into the Uncompahgre valley for irrigation. The tunnel will start from the Gunnison, about 9 miles below the junction of the Cimarron river, and run to a point 5 miles northeast of Montrose, in the Uncompahgre valley. It will be 3½ miles in length, and the ditch will be run 12 miles up the Uncompahgre to intersect the Montrose canal. This will furnish the water for all the land in the Uncompahgre valley, and will bring into use \$280,000 already expended in ditches. Work on the tunnel has been started.

The wave motion of the sea is utilized to run an electric-lighted buoy at the mouth of the river Elbe in the North Sea. The least motion of the water is sufficient to generate the electric current, which, when not needed, passes to storage batteries. It is said generating electricity by means of floats off the shore of Los Angeles county, Cal., has been made a success.

## Telegraph Lines in the Philippine Islands.

Your correspondent served nearly three years on the islands and for a portion of that time was detailed with the signal corps in putting in new poles and wires in new districts. Our chief trouble at that time was avoiding fights with the natives, for the signal corps has other business to attend to. Next came the difficulty of getting proper stock for poles. Fig. 1 shows the kind we used in many long stretches, consisting of a pole of bamboo, cut about 20 feet long, nearly 5 inches in diameter, by a native helper of our Filipino corps, and driven into the ground by pressure after forcing a narrow opening with a pointed stick or bar, then the wire would be looped about one of the fork ends previously cut, as at A. The first typhoon would level miles of these poles. I have seen a water buffalo come along and get his horns against a drooping wire supported on these poles, and, before he could be stopped, pull down half a mile of the frail devices. The next best is the cocoanut wood, and this can be obtained in many sections and used to advantage. In Fig. 2 is a pole of this sort.

These poles are cut by native helpers as the work progresses and water buffaloes are employed to haul the poles from the groves to where wanted. Natives dig holes at proper depths for this kind of pole, and also notch it with steps, C, D, E, etc., by which means the active native linemen are able to ascend the pole at any time. There is a cedar on the islands, but it is not used very much for poles, crossarms, or other

Illustrating the Setting of Poles in Philippine Service.

line work, being mostly used in the cigarbox making business. The habit of patching up poles and connections is common among the native linemen, of which there are now a large number in Government service. They do not use many crossarms, and often a number of wires are carried in singular fashion on the top of one pole. There has been a scarcity of experienced linemen until recently, and some of the line work has necessarily fallen into the hands of untrained Filipino helpers. These fellows are good workers, as a rule, but, of course, inexperienced. Instead of using nails or wood pins, in one case I observed that a squad of natives who were putting in a

short branch line for a telephone between Santa Barbara and an adjoining station, used cordage, as at F, Fig. 3. In another instance, crossarms were made like that in Fig. 4. A peculiarity of some of the native woods is the freedom with which they break off short and square under heavy pressure or when undergoing the trials of the domestic heavy winds which sweep the valleys now and then. The writer has observed poles broken off short and patched, as at G, in the latter illustration.

Possibly one of the leading trials with which any cable or other company will experience in the islands will be the inroads of the millions of white and other wood-eating ants which infest every barrio. These ants move about in bodies of millions and select wood to live upon. They can eat into the white woods, and, in fact, nearly all of the woods of the country, in a remarkably brief space. They select protected

Showing Some Work Relating to Poles and Wires.

positions, such as those under the cover of the earth, and, before one is aware, his house foundation is weakened because of the destructive work of the white ants, who are feasting upon the wood fiber in the posts of his residence. The same way poles of the telegraph system are eaten into, as at H and I in Fig. 5, and when a strain occurs the pole topples over, broken off short, close to the earth. There is nothing else to do but put in another pole and take the chances of the ants moving on to another point. In some cases protection is found by the use of sheet metal covers, like that in Fig. 6, which are made large enough to surround the end of the pole which is submerged. But even these covers are often weak in one little point, and the ants find this particular spot and make a passage through to the relished wood. Again, cement or pottery protectors are used. There are numerous native potteries in the islands in which pots, bricks, pipeware, etc., are manufactured from the rich clay deposits of the islands. Lately these potteries have been turning out weighty but effective casings, like that in Fig. 7, for sinking into the earth, and in which a pole is placed. The letter J indicates the case in section. The pole is put into position and packed tight with the clayey stuff, which hardens and makes an effective protection from the ants.

There are some odd ways employed for carrying a wire underground, or where it needs protection. The natural bamboo stock grows with partition walls at intervals throughout the center, and, in making the bamboo serviceable for pipes or other work which requires a clear passage, the partitions are knocked out with a punching pole. These partitions are merely bored through for wire service, as in Fig. 8. The portion of the side is sketched in open view, so as to show the principle of the partition service. This is at C, C, where the wire which enters at A passes through and emerges at B. The wire is thus sustained in the center of the wood protector.

Fig. 9 shows the way in which bottles are utilized

for insulators, when insulators of the proper kind are unobtainable. The bamboo pole is planted and the top cut off about 6 inches from the partition inside. Then the bottle is placed in the hole, as at D, and serves the purpose well until proper devices can be obtained.

It always interested me to observe the singular methods employed by native carriers for carrying messages to points some distance from the stations. These had to be in waterproof covers, because the natives often forded rivers. In Fig. 10 is the type of carrier often used, consisting of a tube of bamboo, cut about 8 inches long, and provided with a shouldered section over which fits the head piece F. This device receives the message enroled and inserted as shown. Then the cap is pressed on tightly, and the device is usually tight to water, unless the cap is not properly fitted. Often the shoulder is further tightened by use of pieces of hemp.

Evidently when the new lines are put into use for commercial purposes in connection with the new cable, the hard woods of the forests will be cut and set up in good form, such as have been used to advantage in many of the recent military districts during the past eighteen or twenty months. These poles are fashioned like those in Fig. 12. The wood logs are cut in the forests and hauled to the lines where work is in progress, and where gangs of native workers are ready to trim the pole and put it in form for use. These poles are sunk deep and made very secure. The crossarms are of substantial wood selected for the purpose and sawed true. They are not hacked out with native tools. Wrought iron braces are used, as shown, and the crossarm is either screwed, pinned or bolted on. Shortage of metallic devices for this purpose compels the use of wood, native-made pins, like in Fig. 11, devised by using a solid section bored through the top for the pin G, which pin is driven home after the pin is inserted, thus expanding the pin and making it fit so tightly that it can be relied upon. In Fig. 13 is a form of wood screw of native manufacture, in which there are a limited number of coarse threads at H, shaped laboriously by the handiwork of the patient native. These screws have been used to good advantage in pole operations. They cost about 2 cents each, and are made at the rate of ten per day by a native. Twenty cents per day is good pay for the native lineman or helper.

In Fig. 14 is the typical tool carried in the belt of the Filipino lineman. The blade is forged from wagon tires or other metals, after much laborious work, often lasting for weeks, a keen edge is put on and the cutting properties of the tool are remarkable.

Fig. 15 shows the way in which the natives who have stolen wire from the lines utilize the wire for house-building purposes. The bamboo poles are arranged parallel, as shown, and bored through with holes to receive strands of wire which enter at I and come out at J. These wires are inserted at intervals of about 12 inches, and they serve to hold the bamboo securely in position for flooring, bridge surfacing, roofing, side walls, etc. Linemen make rafts after this fashion—that is, the native helpers do the work, and the raft is used to carry stores down stream.—Ex-Philippine Volunteer, in Electricity.

## Automatic Railways.

The high-speed traction experiments which have lately been carried on in Germany, and in which alternating current transmission and poly-phase motors were used, seem to have been remarkably successful. If, as was shown, it is possible to obtain speeds far greater than those of our present railways, and to do this with a simplicity of apparatus that is almost phenomenal, it seems no long step to the automatic railway.

By this term is meant the railway for the carriage of goods, mails, etc., in which the cars are run without the presence of any controlling intelligence aboard them. There seems to be no reason to-day why the railway may not be regarded as a mechanical unit, and with electrical methods of control and power transmission why the intelligence necessary for the guidance of its cars can not be concentrated at a stationary point instead of distributed in the trains themselves. Perhaps to-day it would be a step too far to suggest that such a method could be applied to passenger trains, but is there any reason whatever why it should not work practically for merchandise carrying trains and why we may not live to see the high speed mail and express railway running long distances and controlled from a central office at some convenient point?

The idea is not as chimerical as it may seem. Perhaps the largest factor in the expense of operating railways to-day is the labor cost and a good deal of this cost is due to the high wages earned by the excellent class of men necessary to direct the movements of trains from the locomotive cab. In these days of automatic and labor-saving machinery it seems that the automatic engine driver must certainly come. How easily an automatic railway could be designed should be evident to all who are familiar with the applications of electricity to railroads, while its value, for certain purpose, is incontestable.—Electrical Review.

## The Modern Method of Finding New Elements.

Written for the MINING AND SCIENTIFIC PRESS by  
EDWARD BOOTH.

The number of elements of which the earth consists is unknown. The latest and most authoritative list contains the names of about eighty; but, at the same time, it is announced that there are several more in sight, only waiting to be actually discovered. Recent work with the spectroscope and in other ways has shown results that can only be explained on the theory that elements not yet isolated have an existence. Of the whole list of elements, however, not more than a score or so are common; the remainder are rare and unusual, and the more recently discovered elements are almost without exception of this latter class. It is not impossible that an element yet undiscovered may exist in considerable quantity, as was shown when argon was found a few years ago, and may join the ranks as one of the common elements, but the chances are very much against it.

The method of seeking new elements popular at the present time seems to be rather to more careful working over of old material by improved processes than by exploration of new ground; and, as a result, the more recently discovered elements agree in this peculiarity: that they all closely resemble elements previously well known—resemble them so closely that the most refined methods are needed for their separation and recognition. The more widely different two elements are, the more easily they can be separated. This follows, of course, as a natural result of their dissimilarity. And, conversely, the more closely they resemble each other the more difficult their separation becomes. If they were exactly similar in properties, separation would be an impossibility, for the two elements would not be different, but would be the same. In cases of close similarity, it is necessary to search closely for some dissimilarity, however slight, and make the best use of it. The smallest difference in similarity or volatility can be utilized, if its existence be recognized.

It was the fact that Prof. Baskerville of the University of North Carolina noticed an unexpected reaction in the behavior of a compound of the element thorium that caused him to investigate more thoroughly and led to the discovery of the most recent of the new elements, which he has called carolinium. This element so closely resembles thorium in its ordinary behavior that its existence was not previously suspected. When thorium compounds were treated with various reagents, either in the course of analysis or in the preparation of other compounds, the new element formed precipitates when thorium formed precipitates, and dissolved when thorium dissolved. It was the discovery by Prof. Baskerville that the two elements acted differently in relation to sulphurous acid, that made a separation of the two and a recognition of the new one a possibility.

Argon is, however, the most notable instance in all chemical history of an element escaping recognition on account of its similarity to another well-known element. It is a gas and a constituent of the atmosphere to the extent of something less than 1%—a considerable quantity. But its properties are very similar to those of nitrogen, which constitutes four-fifths of the atmosphere. More than 100 years ago Cavendish foreshadowed the discovery of argon by announcing his belief that there was something in the air in addition to the usually recognized constituents. But air was analyzed thousands and thousands of times in the succeeding century without a suspicion of the existence of argon, until a half dozen years ago Lord Rayleigh noticed that the weight of atmospheric nitrogen was slightly greater than that of any other nitrogen. The difference was extremely small, but was constant. An investigation to discover the reason resulted in the isolation of argon.

And argon itself, at first believed to be a single element, proved to consist of at least five elements so similar in properties that their separation baffled the efforts of the most successful chemists until the experiments with liquid air furnished a method.

The most remarkable of all the elements discovered within recent years, radium, is so much like barium in most of its properties that chemists refused for a long time to acknowledge its existence as a separate element. Radium, once separated, showed certain properties not possessed by barium,

but they were not such as would assist in separating the two elements. The separation was effected by taking advantage of a slight difference in the solubility of certain very similar compounds of the two elements. And almost simultaneously with the discovery of radium came the announcement of the discovery of two other elements—one polonium, a twin of bismuth,

Method of Transporting Lumber Across American River, El Dorado Lumber Co. Tramway.

## El Dorado Lumber Company's Suspended Cable Tramway.

The El Dorado Lumber Co., operating in the Sierra Nevada mountains in El Dorado county, California, has the main body of its timber lands situated between the Middle and South Forks of the American river. Its nearest outlet to market by railroad transportation is Placerville, Cal., several miles south of the South Fork of the American river, which, between the timber lands, flows through a deep precipitous canyon. As the alternative to a long and costly railroad line down one side of the canyon and up the other, the company decided to install a suspended cable tramway, for which the engineers of the California Wire Works made the plans, and later constructed it. It is now in successful operation, as illustrated on this page. Of the kind and for the particular use, it is the first long-distance cross-canyon cable line in California, and would be an interesting and novel construction anywhere.

The tramway spans a canyon 2850 feet wide, while the distance between the towers supporting the rope strain is 2650 feet. The cables used are each 3000 feet long, manufactured of 1½-inch strands with a spiral wire core. Each strand of the ropes has a breaking strain of 125 tons. These cables were manufactured by the American Steel & Wire Co. specially for this service.

The tramway is composed of a double cable span system like the tracks of a railroad, below which hangs a cage suspended from eight trolley wheels. There is a narrow-gauge track on the cage,

Lumber Tramway of the El Dorado Lumber Co., Near Placerville, Cal.

and the other actinium, bearing the same relation to titanium.

How far this method of working over old material will lead is difficult to predict. It is impossible to say that any element, even the commonest, has been studied so carefully and thoroughly that it is completely known. And until an element is known in all the details of its behavior it cannot be said, perhaps, that we are absolutely sure of its purity. Still, the older commoner elements have been studied so long and worked over with so much care that the chances of sensational discoveries among them are remote. Among the rarer elements, however, this is not true. Much remains to be known about them, and there are possibilities, even probabilities, of the discovery of new elements among them at any time.

so that the lumber company can run its cars, loaded with the manufactured lumber from the mills, upon the tracks of the cage. The round trip across the canyon can be made in fifteen minutes, so that, with each car transporting 3000 feet of green sugar pine or other products of the mill, the day's capacity is 120,000 feet in ten hours.

At the landing on the south side of the canyon the cage is relieved of its carload and the tracks receive the small 9-foot car from the carriage. This movement takes but a short time, so no delay is to be considered as counting in the movement. From here the cars are sent along the track to Placerville, Cal., where the yards are located. The successful operation of this plant is expected to start a number of similar projects in California.

## Mining and Metallurgical Patents.

## Patents Issued November 19, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS

AIR COMPRESSOR.—No. 686,784; J. P. Tryner, Pueblo, Colo.

A cylinder having a valved air inlet and an air outlet, water pipes for cylinder to fill same with water and to drain water from cylinder, valves for controlling inflow and discharge of water to and from cylinder, a controlling device for water inflow and discharge valves, controlling device being controlled by overflow of water from cylinder, and controlling device comprising a lever, a rod secured to valves and arranged adjacent to lever; knobs upon rod adapted to engage lever, a receptacle lever, a connection between upper end of cylinder and receptacle, to conduct overflow water from cylinder into receptacle to overbalance lever to cause it to swing and change positions of valves at limits of its movement, an outlet for receptacle, comprising a valved flexible tube connecting the upper end of the receptacle with air reservoir, a flexible tube leading from bottom of receptacle to water pipe cylinder, and a valve adapted to automatically release water from receptacle after cylinder has been emptied.

MACHINE FOR SEPARATING ORES.—No. 686,741; S. R. Krom, Plainfield, N. J.

A bed upon which ore is received formed of tubes of openwork material covered with fine wire netting and having strips at bottom edges of sides for holding materials together, a crossbar and trough-shaped plates for supporting ore bed tubes at their ends adjacent to bellows, plates v' firmly secured within openwork tubes at one end of ore receiving bed, a dam adjacent to and parallel with plates v', hoppers along one side of and below ore bed and discharge pipes therefrom, a flap hinged to and extending upward from hoppers, a receiving hopper upon opposite side of ore receiving bed, and adjustable device at mouth of hopper for regulating supply of material upon receiving bed.

MAGNETIC SEPARATOR.—No. 687,053; R. McKnight, Philadelphia, Pa.

An upwardly traveling belt, having a straight inclined surface of considerable extent, a series of magnets situated behind inclined portion of belt and having poles of different polarity presented toward belt and traveling upward with belt, and means for feeding material to be separated near top of inclined surface, and mechanism for separating belt from magnets after belt has attained top of incline.

BLOWPIPE.—No. 686,758; D. C. Patterson, Cincinnati, Ky.

The burner, a work holder and a blast-creating device comprising a tube connected with a holder containing a liquid to be vaporized by flame of burner and serving to project flame upon work.

MAGNETIC SEPARATOR.—No. 686,889; H. M. Daggett, Philadelphia, Pa.

A frame supporting three parallel shafts, means for rotating shafts, a disk or annulus carried by one shaft, two disks or annuluses carried by other shafts and overlapping first disk or annulus and a plurality of electro-magnets, having poles provided with sharp edges, which lie closely above overlapping portions of overlapping disks or annuluses, and in lines tangential to lines of movement of disk or annulus immediately under them.

MINE CAR WHEEL.—No. 687,027; F. C. Hocken-smith, Pittsburg, Pa.

Wheel hub having an oil chamber continuous therearound and an auxiliary chamber within continuous chamber and projecting inward from outer wall with its inner end in close proximity to inner wall of chamber, inner end of auxiliary chamber being open and end walls 8' thereof having outward convergence.

MAGNETIC SEPARATOR FOR ORE OR CONCENTRATES.—No. 686,835; M. Ruthenburg, Philadelphia, Pa.

A magnet drum, comprising a cylindrical casing; a supporting shaft arranged in concentric relation with drum; a magnet core connecting shaft and casing; electrical conductors arranged to produce a magnetic field comprising core; a housing provided with bearings for shaft and arranged to uphold material treated; a trough-shaped receptacle for raw material fixed with respect to housing; a screw

shaft provided with spiral conveyors, mounted to rotate in housing, and arranged to progress material within receptacle in direction parallel with shaft; means to contemporaneously rotate drum and screw shaft, in definite relation; means to energize magnetic field during rotation of drum, and induce progression of magnetic particles of material treated, upon housing, in direction opposite to direction of rotation of field; means to discharge concentrated magnetic particles; and means to discharge gangue.

TREATMENT OF ZINC ORES.—No. 686,915; H. M. Taquet, Argenteuil, France.

First subjecting a solution containing sulphate and chloride of zinc to action of oxide of an alkaline-earth metal and thereby obtaining by precipitation an artificial product composed of oxide of zinc and sulphate of alkaline-earth metal and then subjecting the product mixed with carbon to heat and thereby obtaining at one and same operation metallic zinc and residue of alkali-earth metal sulphide.

## The "Wear Well" Hydraulic Leather Packings.

The Detroit Leather Specialty Co. of Detroit, Mich., are placing on the market hydraulic "U" flange and cup packings, which are formed by special hydraulic machinery and made of leather specially tanned for them. The different styles and shapes of

packing are shown in the accompanying group of halftones, reproduced from photographs. The pyramid serves to illustrate cups made up in sizes from 6" to 36" in diameter. They also furnish stock for any who have forms of their own and who prefer to make their packings.

They are supplied by the  
Keuffel & Esser Co., 127 Ful-  
ton street, New York. The  
Pacific coast branch is at  
303 Montgomery street, San  
Francisco, Cal.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ARIZONA.

### COCHISE COUNTY.

The water level in the big shaft of the Consolidated Co. at Tombstone has been reached at a depth of 569 feet and further sinking is discontinued until the installation of the pumps to drain the lower levels. The men employed in the shaft are working on the drifts run to connect with the old workings. The pumps, it is expected, will be in place by January or early in February.

### COCONINO COUNTY.

J. Hance of Flagstaff is now Supt. of the asbestos mines in the Grand canyon. He will start work at once and during the winter will employ twenty men. No asbestos will be shipped at present.

### GILA COUNTY.

At the Arizona Com. Co.'s Copper Hill mine, near Globe, work is now confined to the 400-foot level to continue it into the Cochise claim for a distance of about 900 feet from the shaft. N. L. Amster, consulting engineer for the company, has bonded the Great Eastern group of copper claims, adjoining the A. C. Co.'s mine, from H. Sultan and J. B. Newman and has started development work. He has also arranged to start work on the Newman claims, near Troy, as soon as machinery can be placed on the ground.

### GRAHAM COUNTY.

J. W. Hazen, treasurer of the Shannon Copper Co., says the development in the Shannon mine, at Clifton, is increasing ore in sight. In the Harrison tunnel, which is the deepest working, there are 140 feet of 8% sulphide ore, then 30 feet of low-grade ore, then the tunnel runs 35 feet into high-grade oxides. This 35 feet gave an average assay of 10 1/2% copper. A new tunnel, called the Wiseman tunnel, has been started on the White Horse, which will be much lower than any other working now on the property.

The Stevens group and the Keating group of claims at Clifton have been sold to Bridgeport, Conn., people, represented in Arizona by J. N. Wardner. There are twenty odd claims in the two groups, some of which have considerable development work and much ore in sight. An electrical power plant on the river is projected.

### MOHAVE COUNTY.

The Gold Standard mine, on the Santa Maria, near Kingman, which was operated years ago by the cyanide process, after running a tunnel on the vein a few hundred feet, the company lost the ore body and the mine and mill were closed down. This fall a miner was employed to do the annual assessment and was given permission to work where he pleased. He went into the tunnel, ran a crosscut and cut the ore body running parallel with the tunnel at a distance of 10 feet. It is said the mine and mill will start up again.

O. P. Posey and C. K. McCormick, of Salt Lake City, Utah, have bought a group of gold mines out of Kingman about 12 miles and upon the banks of the Colorado river, which they have been opening up for several months under the direction of G. H. Kislinsky. Mr. Posey says the ores that have been blocked out, and for the treatment of which a mill will be erected next season, show an average of \$25 gold per ton. The mine is now equipped with machinery, and four air drills are working on a 15-foot vein. The Colorado river offers abundant water for power and for a mill.

A 20-stamp mill on the Colorado river near Scanlon's Ferry is projected to handle ores from the Lost Basin and Gold Basin mines.

### PIMA COUNTY.

C. F. Schumacher of Tucson has sold his half interest in seventeen claims in the Canyon del Oro mining district to F. Olsen for, it is reported, \$25,000. C. Bauer of Tucson owns the other half interest. About 1000 feet of development work has been done on the group. The values in the ore are gold, silver and copper.

The Narragansett copper mines, in the Santa Rita mountains, southeast of Helvetic, it is reported, have developed good ore bodies. The mines have been bought by the Con. Gold Mountain M. Co., which has also bought the lately discovered mines in the Galurios from P. W. Fleming & Bro. of Tucson.

### PINAL COUNTY.

The Bob Tail Mines Co. is operating property at Ray which has been developed during the last four months. L. H. Eldred is superintendent and has seven men employed. He says the vein is increasing in width. The company has decided to erect a 5-stamp mill on this property at once.

## SANTA CRUZ COUNTY.

G. A. Lonsberry, representing Boston, Mass., people, has bought from the Bacon estate of San Francisco, Cal., the old Belmont mine at Washington Camp. It is a silver and copper proposition, said to be very rich. Work on the mine has been started.

### YAVAPAI COUNTY.

The Decatur C. M. Co., at Jerome, W. S. Owens Supt., is down 300 feet in the shaft and the lower drifts show rich copper sulphides in a slate formation.—The Brookshire and George A. Treadwell mines join the Decatur. E. S. Treadwell is manager and G. Hill foreman. Considerable development has been made on both claims. A tunnel is now being driven on the Brookshire to make connection with the main shaft, about 300 feet deep. The company is said to be considering the putting up of a smelter.

Mr. Monroe, manager of a New York company, is operating the Verde Chief mine, near Jerome, and also the White Horse group, near Prescott. They are doing development work on both properties.

The Mohawk M. Co. has been incorporated by E. Greenwood and A. Falco of Prescott, G. J. Atkins, F. B. Leigh and F. C. Rutan of Chicago, Ill., and H. G. Brown of Pittsburgh, Pa., to mine the Mohawk group, in Pine Creek district, bought from T. Roach. It has some 5000 feet of openings and a 4-stamp mill. E. Greenwood is manager.

The Del Rio Smelter Co., E. A. Haggott Supt., has bought the ranches of J. C. Snow and J. T. Shivers in Chino valley for the site for a copper smelter of 200 tons capacity which the company will build. The lands bought are located on the railroad, 20 miles north of Prescott, and have a large supply of water.

E. F. Bacon of Detroit, Mich., is manager at Prescott of the Hoyt M. Co., composed of Michigan people, who have bought and are preparing to develop a group of five claims on Lynx creek, near Prescott. F. Caghey is president and H. T. Morley vice-president, both of Detroit, and C. Noble of Brown City, Mich., secretary and treasurer of the company.

At the Empire Extension mine, near Prescott, the ore body is said to be widening out. At a depth of 110 feet the ledge is 4 feet wide and gives an average assay of \$9 per ton gold.

## CALIFORNIA.

### AMADOR COUNTY.

At the Buena Vista copper mine, below Jackson, work has been started in making a road, preparing to build a boarding house and clearing for the machinery. A 26 H. P. engine and boiler have been bought.

At the Mahoney mine at Sutter Creek, since the present owner bought the mine, the suggestion of Supt. J. Ross, Jr., has been acted on and the shaft started downward, resulting in striking the apex of a shoot of ore, which it is thought will pay about \$10 per ton.

On the Orr ranch, north of Plymouth, a discovery has been made of croppings over 200 feet long, varying from 3 1/2 to 6 feet in width, in the bed of Indian creek, with a pay shoot, some of which is very rich in visible gold. The foot wall of the ledge is blue slate and the hanging wall is greenstone. The vein is 1/2 mile north of the Empire mine and it is believed to be the main fissure vein of the mother lode and the extension running north of the Empire and Pacific, which have yielded over \$10,000,000.

### CALAVERAS COUNTY.

The latest dividend of the Gwin Mine Development Co. was paid on the 20th inst. In the present year this company has paid in dividends \$115,000 and a total in dividends to date of \$266,000.

The work at the Oriole mine, at Angels Camp, is confined to drifting on the 400 level, the heading being now in a fine prospect. Sinking will be commenced to go 300 feet deeper, making the shaft 840 feet deep.

At the Baltimore, at Angels Camp, the shaft is now down 105 feet. It has cut a shoot which runs from \$2 to \$45 free gold and the sulphurets \$60 per ton.

C. Rasberry has an asbestos mine near Copperopolis, on which he is doing development work.

At the cyanide plant at Indian Creek, near Murphys, large quantities of the old tailings are daily being handled. The owners of the mine are making projects for future working.

### EL DORADO COUNTY.

A. J. Johnson and E. S. Hadley, of Sacramento, own an asbestos mine between Greenwood and Georgetown. They bought the property as a gold mine but have developed a 3-foot asbestos ledge, 20 inches of it being fiber and the remainder of asbestos rock.

Philadelphia people, represented by

F. S. Chadbourne of San Francisco, have bought the slate quarries near Placerville from Mrs. E. Larned. The quarries have been closed down for some time. It is now announced that the buyers will equip the properties with machinery for the manufacture of roofing slate on a large scale. F. S. Chadbourne is general manager of the new company and D. L. Williams of Placerville is Supt.

### NAPA COUNTY.

The St. John quicksilver mine, near Vallejo, has been sold to San Francisco people, represented by F. W. Page. This mine, between the years 1870 and 1875, produced considerable in quicksilver. It has been closed down twenty years. It is the intention of the new company to commence work at once.

### MARIPOSA COUNTY.

U. Roy of Merced and D. van Doesburgh of San Francisco are starting to develop some quartz mines at Indian Gulch on land owned by the Hotelling estate of San Francisco.

### MONO COUNTY.

Work on the custom 10-stamp mill at Bodie has commenced and the completion of the building and the placing of the machinery is to be rushed. The power pipe line has been overhauled and made ready for work.

### NEVADA COUNTY.

Petroleum, hauled by wagon from Truckee, is to be used in Meadow Lake mining plants. The wagons have a capacity of about 800 gallons. It is believed that oil can be taken in cheaper than wood on the ground can be cut and delivered.

### PLACER COUNTY.

The tunnel in the Bob Lewis No. 2 gravel mine, at Damascus, is now in 760 feet. At present Supt. Jarvis is making 10 feet heading per day. A new blacksmith shop, office, changehouse and barn have been erected. Lumber is on the ground for dumphouse and sluices.

At the Ralston Divide G. M. Co.'s mine near Michigan Bluffs, work of development is being pushed. P. Espinas is superintendent.

J. Smith and J. J. Blake of Salt Lake City have taken a bond on the Spanish quartz ledge at Forest Hill. Supt. Baker will extend the main tunnel 100 feet and also sink 100 feet on the ledge. The mine is owned by J. Acuna, E. Bryant, J. Romoldo and others of Forest Hill.

It is reported that an excellent body of good gravel has been crosscut in the upper lead of the Mayflower mine at Forest Hill. This is the lead that paid \$2,000,000 in the front workings of the Paragon mine at Bath. Fifteen men have been put on and arrangements have been made to start the mill.

### SACRAMENTO COUNTY.

A rich strike has been made by Oakland people operating near Mormon island in the Gray Wing drift gravel mine, the pay being said to run from \$18 to \$20 a pan. J. A. Britton, J. P. Burnham, D. P. Gray, J. A. Joyce and A. L. McPherson are the owners, the ground being 480 acres on the old Plumb ranch close by the Blue Ravine mine, the location being about 4 miles northeast of Folsom. McPherson says that in the south drift, which has been reached by an 80-foot shaft to bedrock, there are 7 feet of gravel, while in the north drift there 6 feet of gravel. He estimates that at least \$1500 a day can be taken out. It is said that some of the pans have run as high as \$90.

### SHASTA COUNTY.

The machinery has been received by W. G. Scott, consisting of boiler, engine, hoist and pump, for installation on a Kosk creek copper property northeast of Redding which he is developing. The mine belongs to W. Mural, R. M. Saeltzer, Braynard & Perry and others of Redding.

The Midas mine at Harrison gulch is using twenty stamps constantly. Ore has been struck on the sixth level.

On the divide between Hall City and Harrison gulch the Poston quartz mine is claimed to show platinum. Kidneys of ore are often found bearing a gray-looking mineral, which Dr. Day of the United States Geological Survey declares to be platinum.

The disposing of the slag from the Keswick smelter, it is reported, is to be finally settled. Since the smelter started the slag has been turned into Spring creek and carried into the Sacramento river. Redding, Red Bluff and other towns draw their water supply from the river, and it has been claimed that the slag pollutes the water. Now it is announced that the Mountain Copper Co. will build a dam at the mouth of Spring creek. The water will rise and flow over this, but the slag will collect behind it. As a permanent dumping ground for the slag an unused ravine is to be prepared and a small stream diverted down it.

The Donkey mine, in the Furnaceville

district near Redding, has been unwatered. The mine was formerly the property of the Tehama M. Co. Its ore carries gold, silver and copper, the rock averaging \$40 a ton and some of it going as high as \$77. Former attempts to mill the rock for gold were not entirely successful and the mine, opened down 220 feet, was closed and filled with water. A bond was recently secured by S. D. Morgan of Oakland, who is reopening it. He expects to put in a forty or fifty-ton smelter, and work the mine. He says that the vein is 12 feet wide, carrying an average value of \$40 to the ton.

### SIERRA COUNTY.

S. Irvine of Nevada City has struck a quartz ledge of which the croppings prospect well. He proposes to organize a company and work it in the spring.

W. Wolf of the Ruby mine, near Downieville, says fourteen men are employed taking out ore, and that the mill will be started up again.

At the Telegraph mine at Fir Cap, near Downieville, the tunnel is progressing and has been started to prospect for the channel.

### SISKIYOU COUNTY.

A. R. Vining, of San Francisco, has started the construction of buildings, ditches, reservoirs and grades for a complete hydraulic plant on the Deadwood placer mines, near Yreka. It is proposed to prepare to commence operations this season.

A. S. Hathaway, owner in the Hathaway group, near Callahans, says there are parallel veins in the mine, one of which is about 85 feet wide, between well-defined walls. Over a thousand feet of tunneling, and other development work, has been done. At the present depth copper seems to predominate, and Mr. Hathaway says that if a custom smelter is not built by spring he will put one up on this mine himself. From one of the smaller veins ore averaging \$100 was shipped.

J. M. Hansbrough, of Ashland, Or., has bought the one-seventh interest of D. McCarthy in the Ajax mine, near Cole. The owners of this mine are making preparations for increasing the development work.

The Cherry Hill Q. M. Co. is now putting in another compressed air boiler at their mine on Cherry creek, near Yreka. Work in the 1500-foot tunnel is progressing rapidly.

### TRINITY COUNTY.

Eight miles of 30-inch pipe have been laid along the line from the Sweepstake mine, near Weaverville, to the headwaters of East Weaver creek. Unless interfered with by stormy weather the work of bringing on water to the mine from East Weaver will be completed in about three weeks. At the mine preparation is being made for the winter work and the big reservoir is nearing completion. The company may have a limited supply of water on the mine for this winter. The Canyon creek pipe line cannot be completed before next season.

Hall City, just over the line in Trinity county from Harrison gulch in Shasta county, has a mine which is believed to be a continuation of the rich Midas mine at Harrison gulch. A 10-stamp mill is projected for it. The mine is operated under bond by the Americus M. Co., composed of San Francisco people.

The upraise from the lower tunnel on the Brown Bear mine at Deadwood has broken through into the shaft that was being sunk on the Monte Cristo ledge. The upraise was 380 feet in length when the connection was made. Supt. Dobler says that everything about the mine is looking well.

### TUOLUMNE COUNTY.

The New Era mine at Carters, it is reported, has a large body of high-grade ore in sight. Five stamps are kept running. C. A. Holland, who is also Supt. of the Providence mine, is Supt.

Supt. Kane reports that work has been resumed at the Dead Horse mine at Carters with thirteen men, most of whom are employed driving in the 1600-foot level. The mill is not to be started up for some time.

At the Mt. Jefferson mine at Groveland J. M. Melgham Supt., eight men have been added to the regular crew and the twenty stamps are dropping steadily.

The assay office and blacksmith shop of the Alameda mine have been moved to the B. Soulsby mine, above Arastaville, which, with the Donella and Pleasant Hill mines, has recently been bonded by San Francisco people. The new owners have started work. The bond of the three claims is for \$15,000, \$1500 of which is cash.

R. B. Stanford, representing New York capitalists, has taken a bond on eighty acres of deep gravel near Sonora from Doyle Bros.

C. T. Lindner, president and manager of the Tuolumne Power & Development

Co., says that he expects to have the power plant at Jacksonville completed and in operation by September 1, 1902.

#### COLORADO.

##### CLEAR CREEK COUNTY.

The Newhouse tunnel at Idaho Springs was advanced 264 feet in October—the best month since starting. The new dynamo for operating the electric locomotive is in place and the tunnel has been finished by wiring to substitute electricity for mule power. All of the companies working in the tunnel are making headway on their veins, with considerable ore in sight.

The East Santa Fe mine at Idaho Springs is showing up 4 feet of ore in the 320-foot level. The values are about \$17 a ton. The Santa Fe M., M. & S. Co. has been incorporated by Colorado, Minneapolis and Chicago people to operate the mine. A new plant of machinery is to be installed by A. Anderson, manager. The ores are sulphide and will pay to treat by the pyritic process.

R. C. Vidler of Idaho Springs and Wright, Lilly & Co. of Colorado Springs have revived the old Bradford Locke project to drive a tunnel from a point  $\frac{1}{2}$  mile from the mouth of Fall river to cut under the Kinda, U. P., Specie Payment, Champion and large shipping veins on the Idaho Springs side of Bellevue mountain, and thence under the Topeka and into Quartz hill, in Gilpin county, through the "Patch." They have incorporated the Lucania Transportation, Mining, Tunnel & Drainage Co., capital \$2,500,000. Work has been commenced by hand until the compressor plant is installed. The size of the tunnel will be 8x8 feet in the clear, and it will be equipped with a double track, a waterway being laid between the tracks. The property consists of forty-one claims on the line of the tunnel. The company has bought the Osborne placer and water rights on Fall river, which gives a fall of 91 feet, providing power for operation. A feature of the tunnel is the great depth it will attain. In the first 5500 feet it gains a perpendicular depth of 2200 feet. The total length of the tunnel, as projected, will be about 12,000 feet, and it will cut in its course over 100 shipping veins.

In operations recently begun at the Santa Fe mine Manager Anderson reports cutting 5 feet of pay ore assaying \$17 a ton in the drift from the shaft. The mine had been closed for some years until Milwaukee and Chicago people started the present operation.

It is reported that the Georgetown Deep M. & T. Co. has contracted for a plant of machinery, including an air compressor, for the Kelly tunnel at Georgetown. This tunnel is intended to cut through Democrat mountain for 2 miles or more, to open the veins at from 500 to 2500 feet depth.

##### FREMONT COUNTY.

The Tremont mine at Taclamur, west of Florence, has had a large plant of machinery installed on it. The vein is 10 feet wide and has an average value of \$15.60 per ton.

##### GILPIN COUNTY.

The Gauntlet G. M. Co. at Central City, P. N. Rugg manager, reports that the vein is now about 3 feet in width. The intention of the company is to keep up development work to thoroughly open the property.

Sinking is being done at the Defiance mine, Russell Gulch, near Central City, and the shaft is now down 165 feet. W. S. Robertson, manager, says the company will sink the shaft to 200 feet. A shipment of the first-class smelting ores during October gave returns of \$213 per ton. This mine is being operated by New Orleans, La., people as the Defiance G. M. Co.

The Rome-Gardner G. M. Co. is sinking at the Clark-Gardner mine, with the shaft down 900 feet. Stopping is being carried on in the 600, 700 and 800 foot levels, and some milling and smelting ores are being taken out. The smelting ores show a fair amount of gray copper, and are said to carry very fair values. J. W. Bostwick is manager.

Manager M. D. Draper of the Town Topics G. M. Co. at Central City, says the company will start sinking on a lift of 50 feet in the East Notaway shaft, taking it down to the 600-foot level. The pay streak is about 8 inches wide, and forty-five men, principally working under tribute, are getting out shipments.

Sinking is being carried on in the Boodle mine, at Eureka, and the shaft is now down nearly 245 feet. When the shaft is down 300 feet drifting will be commenced to get stopping ground. No stopping has been done from the 200-foot level. A Jeanesville sinking pump has recently been put in. W. J. Richards is manager of the Boodle M. Syndicate, Ltd., which company recently bought the mine, paying, it is said, \$40,000 for it.

The Butler Con. M. Co. has bought the Butler mine, at Central City. The shaft

building will be repaired and a plant of machinery installed. G. W. Mabey, Jr., is president of the new company, with R. Codman, Jr., secretary and treasurer. Grading has commenced in Chase gulch, Central City, preparatory to the erection of a new mill for the Bonanza Tunnel Co. It will be fitted with twenty-five stamps, crushers, amalgamation plates, Gilpin county bumping tables and Wilfley tables.

The new mill building at the Buell mine, Central City, has been completed, and the work of retimbering and reopening the shaft and levels is finished. The Portland mine, at Wall Street, owned by the Quo Vadis Co., composed of Denver, Colorado Springs and Boulder men, is showing increased value. The shipment sent last showed values of \$4 to the ton. The vein is from 15 to 30 inches wide, with free gold showing all through it. The mine is being worked by a tunnel, now in some 90 feet. I. Moore is president and manager and G. O. Ferguson is secretary.

##### LAKE COUNTY.

T. Goodwin, J. C. Kortz, H. G. Reddington and other members of the New Monarch M. Co. are proposing to establish an independent smelter near Leadville, probably at Salida, but this has not been definitely decided upon. Since the closing down of the Boston plant the New Monarch has had to cease production, although in ten drifts and crosscuts from the Little Winnie alone large reserves of copper sulphide ores have been opened up, capable of yielding not less than 150 tons a day. The New Monarch shaft has been deepened to 700 feet. The New Monarch alone, it is believed, can take out 250 tons a day of desirable ore.

Arrangements are being made to begin regular shipments from the new strike made on the old Big Four property, Leadville, J. Walsh of Leadville Supt. The strike made in the new shaft, at 275 feet, shows a gold-copper vein, the ore of which, it is said, will average between \$20 and \$30 a ton.

The South Winnie Leasing Co. of Leadville is shipping from ten to fifteen tons a day of gold ore which also carries silver and lead values.

##### LARIMER COUNTY.

It is reported that the Boston & Colorado C. Co. will resume operations on the Empire mine, near Fort Collins. S. Stark of Denver is Supt. The shaft, now 200 feet deep, will be sunk to 500 feet.

##### OURAY COUNTY.

The metal production of the county for the first nine months of 1901 has been as follows: Gold \$1,581,698.30, silver \$1,341,067.70, lead \$493,174.62, copper \$64,030.30; total \$3,479,970.92.

The Treasury Tunnel, Mining & Reduction Co. at Ouray will operate all winter, with W. J. Hammond Jr. Supt. This tunnel, which has been under construction for two years, is in 2500 feet, headed toward Ingraham basin, and will cut the veins of the Tom Boy, Argentine, Japan, Sheridan and Columbia mines. A compressor, air drills and other improvements have been added this summer to the plant. The track is composed of 30-pound steel rails and is directly connected with the Silverton Railroad.

##### SAN JUAN COUNTY.

The Ledge M. Co. plant at Silverton, destroyed by fire, will be immediately rebuilt. The loss was \$20,000, comprising the new shaft-house and the old mill. The insurance is \$10,000. A new mill will be built next spring. The shaft-house had just been completed over the vertical workings and equipped with new machinery.

##### TELLER COUNTY.

Terrill & Burke, the lessees who have opened up a large ore body on the surface of the Colorado Boss claim on Gold hill, Cripple Creek, have made a 50-ton shipment of high-grade gold ore. The shaft from which the ore came is 8 feet deep, sunk in ore, with but one wall in sight. A contract has been let to sink to 100 feet in a shaft which will be equipped with machinery.

The Ledge M. & M. Co. has decided to immediately re-equip the property with a complete surface plant to replace the one destroyed by fire. The fire only burned about 30 feet down the shaft, which will be retimbered without delay. The new hoist machinery was saved with slight damage, and can be easily repaired. It has been decided to build a temporary shaft house for the hoisting plant. The new 150-ton mill planned several weeks ago will be built immediately.

At the Newell tunnel in Grouse mountain, at Victor, work will be resumed on a large scale about Jan. 1. The tunnel is now in about 1500 feet and has cut several veins of ore carrying values of from \$2 to \$15 gold to the ton.

It is stated that when the Portland mine was examined in October, 1901, by

F. M. Bradley, there were in sight ore reserves amounting to \$25,000,000, and that since that time the mine has been adding to it. The great output of 1900, it is said, was from development work alone, no stopping whatever being done in that time. The production was \$2,351,000. During the present year, the same authority states, development work alone has been done, the bulk of the ore shipped coming out of the 1000-foot level. Several winzes have been sunk from the floor of this level and have disclosed a number of new and rich veins. The main shaft, known as No. 1, is now down to 1100 feet and is being put to 1200 feet. No. 2 shaft is down between 700 and 800 feet, while No. 3 shaft is down 300 feet. The company is building a mill at Colorado City to cost \$350,000, which will handle 300 tons of ore daily. It is stated that the Portland mill will save \$5 a ton on every ton of ore shipped, which at the present output means a saving of \$45,000 a month, or  $1\frac{1}{2}$  cents extra dividend. This mill will begin to receive ore January 1. As soon as the plant is tested and proved a success it will be immediately doubled to take care of 600 tons of ore every twenty-four hours.

The Bonnie Nell Co. will shortly install a 3-drill air compressor on its property on Raven hill, at Cripple Creek, to replace hand drilling.

McFarland & Ownbey, lessees on a portion of the Burns claim of Acacia Co., at Cripple Creek, will shortly install a 4x6 hoist, to be operated by compressed air, over the winze they are sinking on the ore.

W. L. Matthews, manager of the Mineral Assets Co., operating at Cripple Creek, is now negotiating for a larger plant of machinery and new air compressor, and expects very shortly to resume work on a large scale.

The Empire State Con. G. M. Co. has been incorporated in Wyoming. The office is in Denver and W. B. Williams, G. D. Kilborn and W. H. Spurgeon are trustees. The capital is \$312,500 and the company will operate at Cripple Creek.

#### IDAHO.

##### BINGHAM COUNTY.

The new mill on the mine of the Caribou M. Co. has been started, crushing forty tons of ore daily. The company are largely Mercur, Utah, people, consisting of M. Mahnken, F. S. Hunt and T. B. Wilde. M. D. Stackpole is superintendent. The ores average, it is reported, better than \$10 gold per ton. To economically transport the ores an overhead tramway spanning a distance of 1750 feet between the mines and mill has been constructed and is now in operation.

##### IDAHO COUNTY.

J. R. Wood, of Chicago, Ill., has bought the Blue Jacket group of mines on Salmon river, near Grangeville. The Blue Jacket group embraces nine claims and was for a time leased by Finch & Campbell, of Spokane, Wash. Since then several rich strikes have been made in the ground.

##### KOOTENAI COUNTY.

The town of Tyson, which started eight months ago, now has a store, two hotels, a saloon, a livery stable, a blacksmith shop, a postoffice, a dozen homes and a telephone line to the outside. Rucker work is now in progress on the Gold Nugget, Jumbo and Little Hero placer mines. Work on these claims will be increased as the water permits. R. Mill, owner of the Gold Nugget, is now taking out about four ounces a day. As work progresses into the bank the pay streaks are improving both in thickness and value. A prospect on the bench just west shows 7 feet of pay dirt, valued at 50 cents to the cubic foot. The claims now working are paying from \$7 to \$20 a day to the man with rockers.

##### LEMHI COUNTY.

A discovery has been made of a ledge claimed to be about 300 feet wide near Salmon City. The values, it is said, average over \$10 in gold from samples across the ledge.

##### OWYHEE COUNTY.

The Howe-Manhattan group of mines at De Lamar, owned by B. S. Howe, W. Davies, R. D. Morkill and T. Regan, all of Silver City, has been incorporated. Buildings and machinery are to be put on in the spring, but a few men will be worked on tunnel development this winter.

##### SHOSHONE COUNTY.

The Northern G. M. Co. has been incorporated, with Wallace as its office, and capital \$550,000. The incorporators and directors are C. S. Cryslar, J. M. Savage, B. M. Cryslar, H. E. Charney and C. W. Christman. The incorporation is made to work the deep placers on Lower Beaver creek, between the mouth of the stream and Delta, near Wallace. Work is to begin on an elevator plant immediately. J. Johnson, general manager for the

Etruscan G. M. & M. Co., operating at Murray, says the company has four claims on which he spent over \$30,000 in opening them up before organizing the company to build a mill. He says they propose to build a 40-stamp mill next spring. G. E. De Snell, of Butte, Mont., is president and C. M. Parr of same place secretary.

#### MONTANA.

##### BEAVERHEAD COUNTY.

The 10-stamp mill built by Rabideau & Jennes for the Queen of the Hills mine, in the Vipond district, has been started up. The Queen of the Hills contains a vein of ore about 3 feet wide. It has a 200-foot shaft. The ore is gold-bearing and averages about \$40 per ton.

##### GALLATIN COUNTY.

The deposit of corundum ore in the south end of the Gallatin valley, near Belgrade, is to be developed by a Bozeman company. The incorporators are H. Kirk, the discoverer of the deposit, C. E. McCoy, F. L. Klein and L. S. Ropes. The deposit is said to be a bedded vein from 24 to 34 inches wide, traced for 2 miles on the surface.

##### MADISON COUNTY.

F. M. Field, a cyanide operator at Pony, has sampled the tailings of the Eastern mill at Junction with a view to putting up a cyanide plant.

##### SILVER BOW COUNTY.

Tests are being made of the ores of the Alice mine, at Walkerville, with a view to saving all the metal contents of the ore separately and with a profit sufficient to warrant the operation of the plant. Under the abandoned system the expense of treating a ton of ore was such that only the higher grade ores could be used. With the process now being tested it is expected that \$4 or \$5 ore can be treated at a profit.

The Butte & Arizona C. M. Co. at Butte have sunk three shafts within 75 feet of one another, which at shallow depths have produced ore containing large quantities of free gold from a well-defined, large vein. A sample mill run is claimed to have yielded at the rate of \$200 per ton. The company has made arrangements to have hoisting and pumping machinery on the ground so that work will not be delayed. Development work in the Emma mine at Butte by the Butte M. & D. Co. is progressing. The secretary of the company, W. W. McDowell, is in Chicago conferring with the stockholders regarding additional machinery.

#### NEVADA.

##### EUREKA COUNTY.

The Eureka Con. Co. has had the air compressor and engine in place at the 900-foot level of its mine put in working order, preparatory to prospecting work being done below that level. Laird & Cardu of Ruby Hill, working on tribute in the mine since this repair was made, has found some very promising ore on the 1000-foot level. At present there are thirty-five men tributing in the mine.

##### LANDER COUNTY.

J. D. Wood of Salt Lake City, Utah, has bought fourteen claims near Battle Mountain and is preparing to begin the development of the properties at once. In the same locality Bamberger Bros. have bought a group of ten claims and will begin development at once. The ores occur in porphyry dykes cutting across the country rock and carry fair values in silver and gold. The grade of the ore is much above the average, with the ledges from a few inches to 28 feet and well defined.

##### NYE COUNTY.

The Tonopah & Salt Lake M. Co. has installed a gasoline engine of 22 H. P. on the Wandering Boy claims at Tonopah. The shaft is now down 115 feet and the first crosscut is to be run from this point to the vein, which shows very high grade ore at the grass roots.

On the Tonopah Co.'s Mizpah ledge at Tonopah the lessees continue the hoisting of ore by day and night, and while the teams now running to the railway are not sufficient to clean up the dumps daily the lessees will be allowed forty-five days after the expiration of their lease in which to remove the residue.

R. Hofer has been given a contract by the Tonopah M. Co. to build a telephone line between Sodaville and Tonopah, a distance of 60 miles. It is expected to have the line completed inside of fifty days.

##### WASHOE COUNTY.

There are twenty-eight men employed at present in the Reno Star mine, at Wedekind. The 100-foot level is being advanced and the main shaft, now down 140 feet, is being continued. The foundation for the reduction works is completed.

Nine men are employed at the English mill, near Wedekind, getting the plant in condition to develop 100 H. P. for electric

lights for the mine and town and for an electric hoist.

## NEVADA.

## LANDER COUNTY.

The Battle Mountain M. & M. Co. has been incorporated in Salt Lake City, Utah, capital \$75,000, to operate in Lander county. W. B. Land is president and E. F. Stolzenberg secretary and treasurer. The company owns the Georgia, May, Louise, Mohawk and Annie lode claims.

## NYE COUNTY.

The Tonopah & Salt Lake M. Co., capital \$300,000, has been incorporated. W. H. Dickson is president, J. E. Bamberger vice-president and A. C. Ellis, Jr., secretary and treasurer. The company will develop the Stone Cabin and Wandering Boy claims at Tonopah.

## WASHOE COUNTY.

At the Gold-Copper Ex. Co.'s mine, at Pyramid, a drift 240 feet long has been run on the 100-foot level, following the strike of the ore body. The shaft will be sunk to the 200 level and another drift run. A mill is under consideration to be erected in the spring.

## WHITE PINE COUNTY.

The Joanna mine at Cocomongo, near Cherry Creek, is reported sold by W. A. Watson to E. Hardy, the representative of Eastern people, for \$25,000, of which \$5000 is to be paid before January 1, 1902.

## NEW MEXICO.

## COLFAX COUNTY.

F. O. Watkin of Denver, Colo., has bonded the Golden-Ajax mine at Elizabethtown. The Ajax has produced a large amount of good ore in the past. Work has begun under the bond and the mill has been started.

M. Walsh, manager of the Denver mine at Elizabethtown, is making arrangements for the construction of a mill to use the cyanide process. The plant will have a capacity of fifty tons daily.

Mr. Reiling contemplates the construction of another dredger at Elizabethtown, to be operated this coming year.

## GRANT COUNTY.

The Savage G. & C. Co. of Colorado Springs, Colo., has bought copper lands near Central City for \$10,000. J. R. McKinnie of Colorado Springs, acting for the company, has started the work of development on the claims.

## OREGON.

## BAKER COUNTY.

C. C. Coolidge and G. L. Gibson, of La Grande, who have mines on Burnt river, say the pay ground which covers an area equal to 2½ square miles is very rich, and parties make good wages by hauling the dirt 1½ miles to the river to be washed in rockers. Mr. Bowers, while his water supply lasted, made \$100 per day. The pay dirt is all the way from 1 to 50 feet below the surface, and carries coarse gold. The largest nugget so far found weighed \$106.

The Virtue mine, Manager Buckbee, near Baker City, has just made a week's clean-up of the mill, producing over \$17,000.

## DOUGLAS COUNTY.

The Continental mine on South Myrtle creek has been sold by G. W. Crews to Louden & Hemrich of Seattle for \$12,000. Hall, Rice & Cummings have bonded their mine, adjoining the Continental, to H. H. McCarthy and G. Johnson of Portland at about \$12,000.

McCarthy & Johnson have bonded Robinson & Oatman's mine in the same district for \$10,000. Development work will be pushed on all of these mines by their new owners, work having already begun on the Continental.

## GRANT COUNTY.

The 10-stamp mill has been started on the Sanger mine, in the John Day district, near Granite. The mine is owned by Walla Walla people. Three-quarters of a million dollars have already been taken out of the Sanger, but the mine had been closed down for three years, until 1900.

## JACKSON COUNTY.

A body of high-grade ore has been uncovered at a depth of 200 feet in the Nighthawk mine, near Jacksonville. The pay shoot has a width of 12 inches. Eighty tons that milled \$75 per ton have been removed from the strike. The Nighthawk is a new proposition.

## JOSEPHINE COUNTY.

Several Foothills creek placer mines have been sold to a Seattle company, of which N. H. Latimer is the head. The transfer includes the Lance group of claims at \$35,000 and water rights, also the J. W. Short claims, adjoining, at \$4800, and it is stated that the syndicate has options on several other placer properties in that district. It is said that this syndicate pro-

poses to buy the entire mining acreage down to the forks of the creek.

## SOUTH DAKOTA.

## LAWRENCE COUNTY.

It is stated that the Portland M. Co. of Clinton, Iowa, which is operating in the Bald Mountain country, and is treating its ore in a 50-ton cyanide plant at Central City, has bonded the May & Johnson claims for \$100,000. A shoot of cyaniding ore, 5 feet thick and over 50 feet in width, has been opened up.

The Dakota M. Co. is mining near Deadwood by stripping the soil and loose earth to the depth of from 4 inches to 2 or 3 feet with plows and scrapers, exposing a solid blanket of pay ore, which is then removed by quarry work. This blanket shows over 200 feet wide and 8 to 12 feet deep, and 1400 or 1500 feet northerly and southerly across the company's ground. This ore has lain exposed to view for many years. The shafts put down were in ore as soon as they struck the solid formation, but the old miners did not know it. Their old dumps contain tons of ore that they threw out of their little shafts and left to decompose and disintegrate, not knowing what it was. The Dakota Co. has stripped the ore over a tunnel that the company had put in. From this tunnel the company is working the body by breaking it down into the tunnel, from where it is carried to the loading station and thence to the mill.

## TEXAS.

## BREWSTER COUNTY.

The quicksilver belt in Brewster county has been traced for several miles. It crosses the Rio Grande river into Mexico a few miles below Terlingua. More than 1000 mining claims have been located in the county within the year and some of them are being developed and worked extensively. Quicksilver furnaces have been erected and are in operation. California people who are interested in quicksilver mines have bought mines in this field.

## UTAH.

## DAVIS COUNTY.

At the Wandering Jew mine, near Farmington, a 7-inch streak of ore has been struck in the breast of the tunnel at a depth of 280 feet. Assays indicate 59% lead, 2.7 ounces silver and 60 cents gold per ton. W. D. Mathis of Salt Lake City is treasurer of the company.

## SALT LAKE COUNTY.

At the Dalton & Lark deep tunnel at Bingham, operated by the Bingham Con. Co., graders are making a deep cut for the Rio Grande Western spur, and work is being pushed on the new compressor and boiler buildings. The former, including machine and blacksmith shops, will be 40x80 feet in dimensions, and the latter 48x33 feet. A switch from the railroad will reach the boiler house on a trestle and dump coal directly into bins. The compressor will be 300 H. P. capacity, and be connected with the mines by a 10-inch pipe line. There will be three boilers (self-feeders) of 150 H. P. each. The tunnel is being advanced 10 feet a day and is now in 1600 feet. At the tunnel mouth is the beginning of a village which is expected to be soon made a postoffice. Manager G. Adams and J. J. Tufts of the Oquirrh-Bingham Co. have started work on the Starlus and West Mountain mines at Bingham, now belonging to the company. A small force is putting former workings of the property in order. It is said that the mines are to be operated on a large scale, which, as planned, will include the installation of hoisting and pumping machinery for sinking the Starlus main incline several hundred feet.

## SUMMIT COUNTY.

An electric motor is expected to be placed on the top floor of the Silver King mill, at Park City, at the lower terminal of the aerial tram, to run the elevators, which will take up coal and supplies to the top floor, where they will be loaded for transportation to the mine and sampler over the tram.

The Superior group of claims at Bonanza Flat, Park City, has been bonded to E. A. Saffington and associates, Eastern people, who will develop it. There has been a large amount of work done on this mine.

## TOOELE COUNTY.

The Rover, Gold Dust, Silver Lode and New Mercur mines at Mercur, it is reported, propose to consolidate, pending the closing of which the New Mercur has suspended development.

The Indian Springs M. Co. has been incorporated at Salt Lake City. F. Leak is president and R. M. Holt secretary and treasurer. The company owns the Keystone, Keystone Nos. 1 and 2, and the Brooklyn and Brooklyn Nos. 1 and 2 claims.

The Sacramento M. Co.'s mill and roasting plant at Mercur has been badly damaged by fire which started at the new

roasting plant. The plant had \$15,000 insurance on it. Manager Bothwell says it is the intention of the company to rebuild at once.

## WASHINGTON COUNTY.

The West Point C. M. Co. has been incorporated, capital \$5000, to operate eight mining claims. B. Jarvis of St. George is president and J. Keate secretary.

## FOREIGN.

## BRITISH COLUMBIA.

After four months' shut-down work has been started again in the War Eagle and the Center Star at Rossland. The pumpmen and the engineers have commenced unwatering the Center Star mine, which will take about two weeks, after which mining will commence.

The White Bear mine at Rossland is to be reopened. The theory of the White Bear owners is that the continuation of the Le Roi lead extends into their ground. Acting on this basis, a large sum of money has been expended in development and operations are now to be resumed. The main shaft is down to a depth of 350 feet, and drifts have been run for several hundred feet from the several levels.

T. Drummond, who has been in the Stillwater country since June, somewhere near the headwaters of the Horsefly, is reported to have found some extremely rich ground. He brought out forty ounces of gold to Ashcroft.

The Spitsee mine at Rossland has been closed down pending the installation of machinery of sufficient power to continue the development work. The duration of the close-down is indefinite, but it is the intention of the company to resume operations at an early date, and negotiations are under way with the West Kootenay Power & Light Co. looking to the adoption of electric power.

## MEXICO.

The Grand Central mill, at Minas Prietas, Sonora, has been started up after being closed down six months. At present but twenty stamps are used, but it is reported that the mill will work up to its full capacity as soon as miners to stope out the necessary ore are obtained. G. Kier is foreman of the mill.

At La Calera, about 48 miles east from Magdalena, Sonora, Wuench & Co., of Denver, who bought the Calera gold property from L. O. Cowan, of Tucson, Ariz., have completed and started up a 5-stamp mill on the free-milling gold ores which the mine yields.

La Dura M. Co. have commenced a new triple-compartment shaft upon their Prieto mine, near La Concentration, just west from the Yaqui river, beyond La Barranca, Sonora. The new shaft is about 1800 feet south from the old shaft on the same mine. It is to be put down 1200 feet, and is now down about 300. A big hoist is to be put on the shaft, and a building and a gallows frame are being built.

## Personal.

R. ALLISON of Ketchikan, Alaska, is in San Francisco, Cal.

DANIEL MCCARTHY is the new Supt. Granite mine, Victor, Colo.

F. A. ARTER of Cleveland, O., will leach the tailings at Silver Reef, Utah.

DUNCAN MCVICHTIE has returned from Bland, N. M., to Salt Lake City, Utah.

G. A. LONSBERRY of the Belmont mine at Washington, Ariz., is in Boston, Mass.

W. W. MILLER is now Supt. California-Idaho mine, Pike City, Sierra county, Cal.

F. J. SIEBERT has been appointed manager of the Clifford mines at Tonopah, Nev.

B. F. KELLY, manager of the Kelly tunnel at Georgetown, Colo., is in Chicago.

NOAH CLIMO has resigned the superintendency of the New England mine, Clifton, Ariz.

W. DODGE, foreman at the Princeton mine, Princeton, Cal., is sojourning in San Francisco.

EUGENE M. KIRK, assayer and electrician at the Rawhide, Cal., mine, is in San Francisco.

L. CUMMINS has returned from Calaveras, Cal., M. Co.'s property to San Francisco.

WM. J. MUSE has resigned the superintendency of the Montana Coal & Coke Co., Horr, Mont.

W. SCOTT, Supt. of the Four Black Dogs mine of Valdez, Alaska, is in Seattle, Wash.

F. L. BUTTERFIELD has been appointed manager Vivandiere mine, Turret City, Colo.

DAVID MCCLURE of the Gwin mine,

Calaveras county, Cal., has returned from a trip to Europe.

S. V. RAWLINS has been appointed master mechanic Mass Mining Co., Houghton, Mich.

W. S. GRAHAM, C. E., of Auburn, Cal., has returned from a few weeks' sojourn in Minneapolis, Minn.

PHILIP MIXSELL of Idaho Springs, Colo., is examining mining property in Nevada county, Cal.

ALEX. BURRELL, representing London investors, is examining the St. Julien gold property, Park county, Mont.

CALIFORNIA STATE MINERALOGIST AUBREY has returned to San Francisco from a reconnaissance of Shasta county, Cal.

J. AUDLEY SMITH is Supt. of the newly constructed smelter of the Boston & Seven Devils Copper Co., Weiser, Idaho.

D. G. WILLIAMS of Placerville, Cal., will be Supt. of the Placerville, Cal., slate properties recently acquired by F. S. Chadborne.

A. A. ABBOTT, late Supt. West Colusa mine, Anaconda, Mont., has resigned. He will be Supt. Holy Terror M. Co. at Keystone, S. D.

M. FONTAIN, who has been making an examination of the mines of the Clifton Con. M. Co. at Clifton, Ariz., has returned to Paris, France.

J. F. COSTELLO has been appointed manager of the Northport, Wash., smelter of the Le Roi M. Co., succeeding Manager Hussey, resigned.

J. ALLEN VEATCH, manager Darien G. M. Co., will return next January from California to the company's property, Cana, Colombia, S. A.

JOS. TAAFE succeeds Patrick Holland as foreman Allison Ranch mine, Nevada county, Cal. The latter assumes a similar position at Quartzburg, Idaho.

JOHN FORDYCE BALFOUR, of Benken, Sumatra, D. E. I., has returned to San Francisco, Cal., from Trinity county, Cal., and is en route to Scotland.

C. P. PERIN is now consulting engineer of the Mine Securities Corporation, of which Thos. J. Hurley is president, operating in Colorado and Mexico.

THOS. ELLIS JR. returned this week from Alameda, Cal., to Mina de San Francisco, Ocotlan, Oaxaca, Mexico, where he is superintending operations.

P. HOLLAND has resigned as foreman of the Allison Ranch mine, near Grass Valley, Cal., and has accepted the superintendency of a mine at Quartzburg, Idaho.

A. M. POWELL, C. E., who has been four years in Alaska surveying under the direction of Capt. W. R. Abercrombie for the Government, is sojourning at Seattle, Wash.

D. H. JACKSON, formerly of the Comstock and Candelaria, Nev., who recently returned from Nome, Alaska, will take charge of his mining property at Tonopah, Nev., next month.

J. O. HARRON, of the firm of Harron, Rickard, & McCone, successors to the Parke & Lacy Co. of San Francisco, Cal., has returned home from an extended Eastern business sojourn.

SUPT. CHITTENDEN, who will take charge of the Pioneer-Lynn G. M. Co., Placer county, Cal., has arrived at the property. Leon S. Griswold has been engaged as consulting engineer.

ALBERT LOCKLY, who held the superintendency of the Overman and Caledonia, Virginia City, Nev., mines for nearly thirty years, has resigned and will make his future residence in Oakland, Cal.

E. H. BENJAMIN, secretary California State Miners' Association, has returned to San Francisco, Cal., from attending the meeting of the American Institute of Mining Engineers in the City of Mexico.

GARDNER F. WILLIAMS of Oakland, Cal., general manager Kimberly, South Africa, diamond mines, arrived in California this week and leaves to-day for the mines, where he has supervision of 12,000 men. He says the Kimberly mines are now annually exporting about \$25,000,000 worth of precious stones.

## Obituary.

J. M. GLEAVES, U. S. Surveyor-General of California, died in San Francisco, Cal., on the 27th inst., aged 48. Deceased was long a prominent mining engineer in northern California and took a leading part in the work of conservation of the waters of the State.

Latest Market Reports.

SAN FRANCISCO, Nov. 27, 1901.

**SILVER.**—Per oz., Troy: London, 25½d (standard ounce, 925 fine); New York, bar silver, 55½c (1000 fine); San Francisco, 55½c; Mexican dollars, 47c San Francisco, 44½c New York.

**COPPER.**—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$16.85; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, 16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £65 16s 3d per ton.

**LEAD.**—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 6, sheet 6½, bar 5½c; pig, \$5.25. London, £11 15s per ton=2.53 cents per lb.

**SPELTER.**—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton =3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.

**ANTIMONY.**—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.

**IRON.**—Pittsburg, Bessemer pig, \$16.00; gray forge, \$14.00; San Francisco, bar, 2.60c per lb., 2.65c in small quantities.

**STEEL.**—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

**NICKEL.**—New York, 50@60c lb.

**TIN.**—New York, pig, \$27.50; San Francisco, ton lots, 28c; 1000 lbs., 28½c; 500 lbs., 28½c; 200 lbs., 28½c; less, 29c; bar tin, 32½c.

**QUICKSILVER.**—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 flask of 7½ lbs.; Export, \$45.00.

**MAGNESIUM.**—New York, \$2.90 lb.; San Francisco, \$3.75.

**ZINC.**—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

**BABBITT METAL.**—San Francisco, No. 1, 10c.

**ALUMINUM.**—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

**SOLDER.**—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

**PHOSPHORUS.**—F. o. b. New York 50@60c lb.

**ASSAY LITHARGE.**—San Francisco, 10c lb., small lots.

**FERRO-MANGANESE.**—Pittsburg, 80%, domestic, \$58.50, large lots.

**TUNGSTEN.**—New York, \$ b., 95c; San Francisco, \$1.15.

**FERRO-TUNGSTEN.**—New York, 37%, 32c; San Francisco, 65c (60%).

**POWDER.**—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

**CAPS.**—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

**FUSE.**—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

**CANDLE.**—Granite 6s, 16 oz., 40s., 9½c lb set; 14 oz., 40s., 8½c.

**CHEMICALS.**—Cyanide of potassium, 98%-99%, jobbing, 31½@32½c lb.; carloads, 29@30c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c lb.; soda ash, \$1.90 lb.; hyposulphite of soda, 2½@3c lb.; blue vitriol, 5½@6½c lb.; borax, concentrated, 7@8c lb.; chlorate of potash, 12@13c; rock sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c lb.; caustic soda, in drums, 3@4c lb.; Cal. s. soda, bbls., \$1.00; sks, 95c lb 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

**OILS.**—Linseed, pure, boiled, bbl., 74c; cs., 79c; raw, bbl., 74c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.

**COAL.**—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

Commercial Paragraphs.

The Atlas Pipe Wrench Co., manufacturers of the Atlas pipe wrench, are believers in expositions, as their sales of pipe wrenches show a wonderful increase in the last few months, a great deal of it due directly to the Pan-American Exposition, at which they gave a practical demonstration of the workings of the pipe wrench, and were awarded the highest medal for pipe wrenches.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING NOVEMBER 19, 1901.

687,175.—LOCK—H. Barry S. F.

686,932.—HAT SHOWCASE—R. W. Brown, Colfax, Cal.

687,127.—BRACKET—J. E. Chapman, San Jose, Cal.

686,806.—EXPLOSIVE ENGINE—H. Enge, West Berkeley, Cal.

687,025.—BORING MACHINE—B. E. Hervey, Ritz, S. F.

686,851.—WEIGHING APPARATUS—G. Hoepner, S. F.

686,835.—BUCKET—E. Hutson, Oregon City, Or.

686,976.—AIR VALVE—Kelly & Hazard, Los Angeles, Cal.

687,159.—BOTTLE—D. Landau, S. F.

687,052.—WINDOW FASTENER—J. J. McCormick, S. F.

686,883.—OILER—J. D. McFarland, Jr., S. F.

686,957.—SYRINGE—J. M. Miller, Dayton, Wash.

686,825.—VEHICLE TIRE—W. Morck, Oakland, Cal.

686,951.—WELL BAILER—W. Plotts, Whittier, Cal.

686,784.—TOOTH BRUSH—C. W. Richards, S. F.

687,069.—SEAL LOCK—H. A. Rotermund, Montague, Cal.

687,100.—RAILWAY—J. N. Young, Alameda, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**AUTOMATIC OILING DEVICE.**—No. 686,863. Nov. 19, 1901. J. D. McFarland, Jr., San Francisco, Cal., one-half assigned to John Bruckman of same place. This device consists of a double-headed piston valve adapted to reciprocate in an oil-containing vessel, and an oil passage in the side of the valve through which the oil may pass intermittently from the vessel to the part to be lubricated. The length of the oil channel and the amount which it will thus contain is regulated so

that any given amount of oil may be periodically delivered to the part to be lubricated.

**ELASTIC VEHICLE TIRE.**—No. 686,825. Nov. 19, 1901. William Morck, Oakland, Cal., one-third assigned to George E. De Golia, same place. This invention consists in the employment of concentric rings, one forming the tread and the other located at a short distance interior thereto. Radially sliding rods extend from the outer rim through the inner, and springs surround the rods between the two rims and by their tension maintain the rims normally approximately concentric with each other. The springs are compressed by weight upon the inner rim through the spokes connecting the hub with said rim, and thus an elastic bearing is at all times in rollers or equivalent means for reducing the friction of the sliding rods are suitably connected with the rim.

**REVOLVING HAT SHOWCASE.**—No. 686,922. Nov. 19, 1901. R. W. Brown, Colfax, Cal. This invention comprises a multiple sectional containing case for hats, said sections being mounted upon a revolvable carrier and each section being independently turnable upon its own axis. The sections are provided with a plurality of peculiarly constructed supports upon which the hats are placed, so that a great number of hats may be conveniently displayed and at the same time protected from dust.

**EXPLOSIVE ENGINE.**—No. 686,806. Nov. 19, 1901. H. Enge, West Berkeley, Cal. In this engine two pistons are movable in a single cylinder and the rods of said pistons are connected with clamps that the pistons are separated on the inward stroke toward the rear end of the cylinder, and at the same time a body of explosive fluid is admitted between the pistons during this movement. Toward the end of the rearward movement the pistons approach each other and the body of explosive fluid is forced through the rear piston into the chamber at the rear end of the cylinder, where it is ignited and the explosion acts to propel the compound pistons toward the forward end of the cylinder. Means are provided for opening an exhaust passage to allow the escape of the products of combustion upon the second inward stroke, while at the same time a new charge of explosive fluid is taken between the pistons in readiness to be exploded at the proper instant. An engine thus constructed becomes what is known as a two-cycle engine, instead of a four-cycle, which is the ordinary construction of the usual gasoline engine.

**AUTOMATIC WEIGHING APPARATUS.**—No. 686,861. Nov. 19, 1901. G. Hoepner, San Francisco, Cal. Assigned to Union Sae's & Mfg. Co., of Sacramento, Cal. This invention relates to that class of apparatus which are adapted to weigh powdered and granular or similar substances and deliver them in regular quantities into such receptacles as may be desired. It consists of a plurality of scale pans adapted to receive containers into which the material is to be weighed. A beam or frame is fulcrumed and tiltable with relation to a main support upon which it is carried, and which is in turn suspended from a scale beam, so that while both have a certain movement in unison there is also an independent movement of the two. Connected with the supplemental tilting beam is an oscillating lever carrying a segment and stop at its upper end, and means by which the supported end of the supplemental beam is raised when the filled package is moved to place the apparatus in condition for again weighing.

## ASSESSMENT NOTICES.

**NATIONAL CONS. MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of November, 1901, an assessment (No. 15) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of December, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 23d day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. W. FLEISSNER, Secretary.  
Office—773 Mission street, San Francisco, California.

**ORLEANS CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of November, 1901, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 324 Pine street, Room 10, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of December, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 26th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
GEO. P. THURSTON, Secretary.  
Office—324 Pine street, Room 10, San Francisco, California.

**LARKIN MINING COMPANY.**—Location of principal place of business, El Dorado County, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of November, 1901, an assessment (No. 1) of two cents per share was levied upon the capital stock of the corporation, payable immediately to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

N. P. REMINGTON, Secretary.  
Office—112 Main street, San Francisco, California.

**MOHICAN MINING & MILLING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of November, 1901, an assessment (No. 2) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 300 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3d day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
JNO. W. CLASSEN, Secretary.  
Office—No. 300 California street, San Francisco, California.

## DELINQUENT SALE NOTICE.

**THE YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 4) levied on the 12th day of October, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Names.                | No. Cert. | No. Shares. | Amt.    |
|-----------------------|-----------|-------------|---------|
| J. L. Bryson.....     | 99        | 1,070       | \$30 00 |
| J. L. Bryson.....     | 100       | 1,001       | 31 00   |
| Myles Pickthall.....  | 76        | 1,000       | 30 00   |

Direct Acting  
Hoisting  
Engine

BUILT FOR THE  
Anaconda  
Copper Mining  
Company  
OF MONTANA.

Embodying all that  
experience and  
practical working  
have demonstrated  
as valuable in this  
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

"THE DANIEL BEST"

50 Horse Power

TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.
Estimates made for complete Steam Freighting Outfits. Address

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

PATENTS

DEWEY, STRONG & CO., San Francisco, Cal., and Washington, D. C.

We are prepared to transact business with our clients direct from either our San Francisco or our Washington office. We have representatives in every country in the world having patent laws. The information accumulated through long and careful practice before the Patent Office and the frequent examinations of patents already granted, for the purpose of determining the patentability of inventions submitted to us, enables us to advise inventors, often saving them the expense of applying for a patent upon inventions which are not new. All worthy inventions patented through us are described in the *Mining and Scientific Press*. Guide to inventors sent on application. Address

DEWEY, STRONG & CO., 330 Market St., San Francisco, Cal., or 918 F St., Washington, D. C.

SUCCESSOR TO

GATES IRON WORKS, Chicago.
DICKSON MFG. CO., Scranton.

MANUFACTURER OF

Mining Machinery

There are
reasons
why

the adjustable and practically indestructible GATES ROCK AND ORE BREAKERS produce crushed material at a much lower cost per ton than other breakers. To more than 5,000 users located in all parts of the world, the cause is readily apparent. Gates Breakers not only have much greater capacity, require less power, run without vibration, stoppage or delay, with less wear on the crushing surfaces and permitting carloads of material to be dumped directly into the hopper of breaker, thus reducing the employment of handling devices and manual labor to the minimum, but other convincing reasons supported by indisputable evidence of the superiority of Gates Breakers are given in Gates Catalogue No. 1. Avoid a false start and possibility of failure. There is absolutely no breaker made that will compare with the "Gates."

We are prepared to build crushing plants complete, screens and perforated metal of all kinds, elevators, hoists, engines, and boilers. We also build cement machinery of the latest designs. ESTIMATES FURNISHED UPON APPLICATION.

EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeanesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeanesville Pumps.

We claim that in Jeanesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

... residents to have the local
... since and Surveyor General's office at Sitka
changed to Juneau. The prayer of the petitioners is
refused, principally on the ground of economy to the
Government. The difference in office rent is \$250 a year
in favor of Sitka.

It is difficult to determine just which is "the banner
town of the country for subscriptions to the MINING
AND SCIENTIFIC PRESS." Probably Tonopah, Nevada,
comes as near the top of the list in this respect as any.
Out of a population of 750, there are 110 paid subscrip-
tions. Since July 1, 1901, the names of 617 new sub-
scribers have been received from various parts of this
west half of America.

THE general course of the price of silver has been
downward since the beginning of the year, when it was
64 cents. In April it was 58½ cents and at the present
time is 58 cents. The production in the United States
is not changed much during the last ten years. In

THE MAP SHOWS--

The shaded part shows that where the most metal mining is done the MINING AND SCIENTIFIC PRESS has the largest part of its circulation. It tells its own story. The MINING AND SCIENTIFIC PRESS is the only mining paper that has a general circulation therein.

Every advertiser in the MINING AND SCIENTIFIC PRESS, whether he pays for an inch or a page, knows that he weekly talks to the men who do the buying. He knows his audience just as sure as though he could look into their faces or shake hands with them. He knows that his announcement is weekly seen by the men throughout this west half of America who are thoroughly representative of the great metal mining industry of the country.

The readers of this paper have bought mining machinery and supplies to the extent of over \$150,000,000 in the last ten years, and their annual purchases now exceed \$18,000,000. Its advertising pages are referred to everywhere by intending purchasers of mining machinery or supplies as a directory for that purpose. The paper refuses questionable advertising, and its thousands of readers learned long ago, to their satisfaction, that the appearance of an advertisement in its columns is of itself good

evidence of reliability. An advertiser in this paper is in good company.

In advertising, results are what count. It is not what an advertisement costs, but what it produces, that determines its value. Leading concerns

who continuously buy advertising space herein, say that it is not an experiment, but a profitable investment to advertise in the MINING AND SCIENTIFIC PRESS. Its rates, comparatively, are "cheaper" than those of any other similar publication. "Cheapness" is not regulated by what you pay, but by what you get for what you pay. Advertising in this paper, if properly backed up by what is advertised, insures profitable publicity.

The region shaded on the map has a POPULATION OF TEN MILLIONS --- MINING IS ITS CHIEF INDUSTRY.

No advertiser who sells to mining men would omit using this journal if he knew the truth about it.

If from any reason anyone thinks "Advertising doesn't pay," we would like to furnish him with evidence that the right kind of advertising does pay. Economy in advertising is like economy in everything else—judicious expenditure of money. The results of an advertisement are what determines its value.

MINING AND SCIENTIFIC PRESS,
330 MARKET STREET,
SAN FRANCISCO, CALIFORNIA.

Paint

P & B Paint enters the pores of wood, stone, concrete and metal readily—it penetrates and preserves—checks decay—prevents the ravages of ants and other insects—it resists fire—is elastic and is never injured by heat nor cold—will not run, crack nor scale.

Black in color—requires no heating, stirring or mixing—all ready to use and anyone can apply it. For foundation posts and pile work—in fact, underground work of all kinds.

Enables roofs, sheds and all buildings to withstand the heat, cold, moistures, fumes, etc.

Trade Paper Advertising.

It is very easy to go wrong in the matter of trade paper advertising. One temptation is to go into several without much reference to their circulation, stability, value, influence, or reliability, but there is hardly ever more than one paper in a trade that is first rate as an advertising medium. Since it is the leading paper in that trade, it is apt to reach nearly everybody of consequence in the business, whereas the circulation of the others, or of most of them, is likely to be largely a duplication. There are apt to be several very good reasons why that particular leading paper is the leading paper. It has the right kind of matter in it or it wouldn't be subscribed for so generally. It is usually on a firm foundation, and hence it conducts all of its affairs purely on a business basis. No fear, no favor; the same treatment for all, and that fair business treatment. All this, besides giving a publication the effective support of the trade—by means of which it is enabled to make money and to be independent—also gives the publication a character for reliability which helps the advertising as well as the reading matter—helps to make the advertising interesting, helps to make the reader think that the advertising is true. Another mistake that some make in reference to the trade paper is that they just put in a card—any old thing will do, you know—and let it go at that. The space that they buy is their own. Why shouldn't they make the best possible use of it, then? Why shouldn't they take pains with the preparation of their copy? Why shouldn't they change the matter often, perhaps in every issue? Why shouldn't they assume that the reader of the paper in question will follow the advertising pages generally, and their own advertising matter in particular, if there is live, fresh news in them?

EXPENSE SAVED INVENTORS BY
PRELIMINARY SEARCHES.

COMMUNICATIONS CONFIDENTIAL.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports since 1793, with full copies of U. S. Patents since 1872. As a result we are able to give reliable advice as to the patentability of an article, frequently saving the inventor the cost of an application. Our Washington branch tends exclusively to our business before the Patent Office. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, including filing of Caveats, Trade-Marks, Copyrights, Labels; prepare Assignments, Licenses and Agreements; give Opinions on Patentability and Infringements, etc. Circulars free on application.

STURTEVANT MILL CO. 113 Clayton St. Boston, Mass.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

SMOOTH-ON

TRADE MARK

IRON CEMENTS

For stopping leaks and pitting in marine boilers, for boiler patching, for repairing leaks and fractures in steam and hydraulic work, and for repairing blemishes in iron or steel castings. These cements are prepared in powdered form and applied by mixing with water; when hard they will withstand a red heat, steam, water or oil, and expand and contract the same as iron. Write for illustrated catalogue and prices; when ordering state for what use.

ROSE'S

Complete Practical Machinist.

19th Edition.

The Complete Practical Machinist: Embracing Lathe Work, Vice Work, Drills and Drilling, Taps and Dies, Hardening and Tempering, The Making and Use of Tools, Tool Grinding, Marking out Work, Machine Tools, etc. By Joshua Rose, M. E. Illustrated by 335 engravings. 19th edition, greatly enlarged, with new and valuable matter. 12mo., 504 pages. Price, \$2.50. By mail, free of postage, to any address in the world.

ABSTRACT OF CONTENTS.—Chapter I. Cutting Tools for Lathes and Planing Machines. II. Cutting Speed and Feed. III. Boring Tools for Lathe Work. IV. Screw Cutting Tools. V. Lathe Dogs, Carriers or Drivers. VI. Turning Eccentrics. VII. Hand Turning. VIII. Drilling in the Lathe. IX. Boring Bars. X. Slotting Machine Tools. XI. Twist Drills. XII. Tool Steel. XIII. Taps and Dies. XIV. Vice Work. Tools. XV. Fitting Connecting Rods. XVI. Milling Machines and Milling Tools. XVII. Grindstone and Tool Grinding. XVIII. Lining or Marking out Work. XIX. Machine Tools. XX. To Calculate the Speed of Wheels, Pulleys, etc. XXI. How to Set a Slide Valve. XXII. Pumps. Index.

By the same author:

Rose.—Mechanical Drawing Self-Taught. 330 illustrations. 8vo. \$4.00
Rose.—The Slide Valve Practically Explained. Illustrated. 12mo. \$1.00
Rose.—Modern Steam Engines. Illustrated by 453 engravings. 4to. New ed. revised. \$6.00
Rose.—Steam Boilers. A Practical Treatise on Boiler Construction and Examination. 73 illustrations. 8vo. \$2.50

Elaborate Illustrated Circulars of the above Important Books will be mailed to anyone in any part of the world who will furnish his address.

The above books sent by mail free of postage at the publication prices to any address in the world.
A catalogue of books on Steam and the Steam Engine, Mechanics, Machinery, Machinists' Work, Tool Making, etc., sent by mail to any address.

The above illustration shows the
method of holding and sighting BRUN-
TON'S PAT. POCKET MINE TRANSIT,
when taking courses or horizontal
angles. The construction is such as to
permit of simultaneous sighting and
reading. No tripod or Jacob's staff is
necessary, and an operator, after be-
coming accustomed to its uses, can
take the Transit from his pocket, take
a reading and replace the instrument
before a sighting compass can be
placed. The most accurate and reli-
able pocket instrument on the market.

The Lunkenheimer Automatic Injector

For All Classes of Steam Boilers.

Well designed, compact, efficient, durable, low priced
and reliable. In action it is easy to start, has large
range of work, full capacity, is absolutely Automatic and
the discharge can be graded within wide limits. All
parts are well proportioned, strong and durable, and any
worn-out piece can be easily and quickly replaced at
slight expense. Starts low at 22 lbs., works high to 185
lbs. Feed water 76 degrees, lift 3 feet, works without
adjustment of steam or water at pressures from 60 to 180
lbs. Automatically restarts if operation is temporarily
interrupted. Tubes are easily removable for examination
and repairs by the simple use of a common wrench. De-
void of small parts which are easily lost or unreliable in
action. Fifty per cent more durable than any other ma-
chine of its class. Retains original efficiency under con-
stant usage and slight wear on tubes will not impair its
operation. Works well with hot feed water and on long
lifts. Impartial tests solicited and satisfaction guar-
anteed. Specify the Lunkenheimer Automatic Injector
and order from your dealer. Send for descriptive circular
and catalog of engineering appliances of superior quality.

DURKEE ELECTRIC Rock Drill

The Standard Size Drill has the full
capacity of any 2½ in. Air Drill, at about
one-tenth the cost of power for operating,
striking 750 blows per minute.

The weight of Drill is comparatively
the same as the corresponding size of Air
Drill, excepting that an Electric Motor is
used for driving by means of a Flexible
Shaft.

The Drill is furnished complete with
Column, Arm, Clamp, Guides, Motor,
Flexible Shaft and Speed Controller.

JOSHUA HENDY MACHINE WORKS, Agents

Nos. 38 to 44 Fremont St.

SAN FRANCISCO, CAL.

Thomas W. N. Hilliard, agent of
the Canada General Electric Co., is
in the city on route from Sault Ste.
Marie, Mr. Hilliard has been at
the Payne mine for several days,
where he has been installing two
Durkee electric drills. The initial
trial, Mr. Hilliard says, were very
satisfactory. A hole of 43 inches in
depth was drilled by one of the drills
in 1½ minutes. Each of the drills
is driven by two horse power while it
takes 15 horse power to furnish power
for a drill driven by compressed air at
the same altitude at which the Payne
mine is situated. It remains to be
seen, however, whether the cost of
maintenance of the electric drills will
be greater than the air drills and it
will take a month or two to fully
ascertain this. Mr. Hilliard says that
as far as he could judge from the
work of the drills that they are just
what is needed for the Slocan
which is not nearly so hard as the
rock in the Slocan mine and they
ought not to do as well in the latter.
The drills are of the Durkee pattern.
The dynamo which drives each drill
is placed a few feet away from the
drill and the power is communicated
by a flexible shaft. The makers of
the drill claim that it is the most
flexible machine on the market and
that it is especially effective in tunnel
work. The drill is fastened to the
crammer the same as the ordinary air
drill and in many ways it resembles
the latter. The makers claim that it
is the most economical drill in use.

The FRUE VANNER with Brownell "PATENT LIP" Flange Belt

stands for everything that is good, desirable and reliable in concentration. The FRUE VANNER is the STANDARD by which ALL OTHER concentrators are judged. If you buy some other concentrator you MAY get satisfactory results. If you buy a FRUE VANNER you are SURE to be satisfied. You get a durable machine of the highest capacity that gives a clean concentrate with the least possible loss in the tailings. The FRUE is furnished with the Brownell "PATENT LIP" FLANGE BELT. This is the best and highest priced

belt on the market. There are over 1700 of them now in use, and we have plenty of testimonials to show that after seven years' constant wear they are still without a break in the flange. All the largest Mining and Milling plants on the Pacific Coast, and in all parts of the world, have adopted them. Machines are made in four and six-foot widths, and furnished with either plain or corrugated belts. We supply either wood or iron carriage frame, as may be desired.

Mine Tunnels.

The art of construction of horizontal mine openings, tunnels, adits, levels, gangways, galleries and drifts is deficient in descriptive and technical books which are close enough up to the most advanced mining practice to be text-books for students or reference books for practical mining men. There is much that is written and appearing from time to time in current technical publications, recording the facts and expressing some of the deductions from the facts, of certain special constructions of tunnels that is valuable for the engineering student and useful to

full size and the mechanical structure required to make the large opening safe and permanent. The heading is treated as a minor detail. The construction being temporary, its detail as compared with the full structure is both technically and commercially subordinate. With the metal miner, whose mine openings are limited to about the dimensions of the railroad tunnel heading, it is the detail of the latter that is important. Works on railroad tunneling, admirable for the use of railroad engineers and builders, thus fail to meet the requirements of the miner.

In mine tunneling, including in the one word all the

made possible changes in the general construction practice, the knowledge of which is not general nor, it might be added, generalized. For example, the old practice was to make the cross-sections of the tunnel as small as possible, on the theory that it was economical of both labor and powder. Now it is found that, with power drills and a cheaper and better explosive, a comparatively large cross-section is the cheaper. The question of grade, which was formerly left very much to the disposition of the miners on the particular works, is now looked into very closely, in order to get the maximum of efficiency by the proper balancing of the load on the

Aztec Turquoise Mine, Wallapai Mining District, Mohave County, Arizona.—(See Page 246.)

the miner engaged in similar work. These occasional publications which, from the form and place in which they appear, may become forgotten and lost sight of, are excellent material for such a text and reference book as is here suggested. It is not to be inferred that current publications will supply all the data. It is the mass of minor but exceedingly necessary practical detail, the knowledge of which is erroneously assumed to be possessed by every engineering student and miner, that is particularly wanted to connect and explain the data which from its novelty is written up and published.

Works on railway tunneling very largely miss the statement of the data and fail to discuss the portion of the work that would be of practical value to the miner. Railway tunnels are large openings, and to railroad engineers the novel features are those connected with the enlargement of the heading to the

horizontal mine openings, changes in practice of construction have been frequently made during the past twenty-five years.

The change in the character of explosives, from black powder to dynamite, made possible a reduction in the labor of hand drilling and a considerable cheapening of costs. The development of compressed air drills, and later of electric power drills, have made possible further improvements in practice and lowering of costs. Meanwhile the invention of practical hand-power drills has reduced the gap between the work of the old hand methods and the new power methods. The handling of the broken out spoil, originally a very subordinate detail, has by the improvement in other details become in its turn the principal reducible item.

All these improvements in details of work have

power of incoming empty cars and outgoing loaded cars.

The problem of mine tunneling, as a whole, is the obtaining of lower average costs, and a lessened average of time used for the unit of work. In this it does not differ from any of the other separate parts of the business of mining. Having, however, received much less study, and having less complete records of practice, there is an opportunity for the presentation of a text-book or several text and reference books on the subject which would be valuable. It is ever surprising to those who do know something of an art that there is an enormous demand for information on the subordinate details of that art. The inquiries that come to this paper for information as to details of mine tunneling are numerous. They fairly indicate how much the book on mine tunneling is needed.

THE increased consumption of silver by China, as a result of the exploitation of its resources by foreign capital, is largely—and for the time almost entirely—offset by the cost of the opening up of the country. The debt which China is to pay as a result of the late war, being payable in this country and in Europe, is paid by exchange, which reduces the amount of silver that is shipped to China. The amount of the indemnity is \$334,000,000 gold, on which interest at 4%—\$13,360,000 gold—is paid. This sum paid by exchange will cut just that much off of the value of silver export to China. It is probable that the discounting of this a year ahead is one of the causes of the recent drop in the price.

THERE is an opportunity for a reform in the U. S. Land Department through an act of Congress increasing the maximum compensation allowed Deputy Surveyors for surveying the public lands. These rates were fixed many years ago when rates of wages were low and for surveys made in the Mississippi valley lands where the work is light. At no time were the maximum rates a reasonable compensation for rough mountain lands, and they are ridiculously inadequate now and should be increased. The physical impossibility of doing first-class work for the sums paid has in the past been the excuse for very much bad work in these surveys throughout the West. It has cost the Government in the end much larger sums to rectify some of this work than it would have paid out at a fair rate for doing it correctly in the first place.

THE percentage of profit that should be considered a standard for mining investments has not been established as a commercial law. The tendency of investors is toward making the figure too low. The circumstances under which anything less than 10% per annum should be considered as the basis of an investment are so exceptional that it is safe to consider that there are no such circumstances. Fifteen per cent per annum is, as a rule, reasonable. The laws of averages and means are doubtfully applicable to such problems. It is safer to disregard them. Each mining enterprise must be considered on its own merits. Conditions in mining rarely duplicate themselves in different mines. Where 15%, reasonably to be anticipated as the earning on one mining investment, would make it desirable on that basis, another mining investment that offered 20% might be less desirable. The prospective life of the mine is an element that must not be neglected; neither must the prospective market price of the metal it yields.

Mountain Roads.

A paper on mountain roads, by James W. Abbott, which is appearing in this journal, is an instructive discussion of a subject which is of economic importance to the mining industry. Generally mountain roads are built for mines and nothing but mines and the industrial interests directly dependent on them. The importance and money-saving value of properly constructed roads, to farming, has been recognized for years, and a great deal of valuable work has been done toward securing them. The recognition of the money-saving value of good roads to mining has been slower of development.

For mining, the unavoidable mountain road building has generally been wanted for use in a hurry, and has been frequently built by the first teamsters, who, to save time, took the lines and grades of the pack trails. The actual mountain roads for miners, particularly the early-built ones, have thus been almost anything except the kind of construction which Mr. Abbott recommends. Later practice is much better and there are many examples of well built roads in the older mining districts.

Mr. Abbott's suggestions for mountain road construction are excellent. It would seem, though, that the particular suggestion he makes relative to the use of dry-stone retaining walls is subject to some modification in localities with favoring climatic conditions and when the wall is not built to hold loose slide material. In California and Arizona dry-stone retaining walls are a common detail of construction, particularly in the crossing of sharp gulches and ravines. They have there been found as a rule a safe and satisfactory construction. The walls are sometimes made as high at the center as 20 feet, and they are built as a general rule nearly vertical. Water is allowed to flow across the roadway and fall over the face of the wall. The writer recalls at the moment no instance of a failure of such a construction. Such dry wall construction would seem to be safe and practical in regions where there is little or no frost and ice. Where the winter frost and ice is considerable, as in the Rocky mountain States, the construction of dry wall only where indispensable, and then with a batter slope less than one horizontal to two vertical, is the rule that it would be unsafe to neglect.

The Making of Gold.

In this issue on page 244 appears a contribution by Edward Booth entitled, "Can Gold Be Made Artificially?" It is a serious, dispassionate discussion of the question suggested by the claims made by the late Professor Wynne of Denver, Colo., that he had discovered the secret of making gold artificially. It will be noted that Mr. Booth expresses the conclusions of the most advanced chemical research, when he says that we can be by no means assured that in the elements, as we know them, we have determined the original constituents of matter. The elements as we now define them may be compounds. Ultimately we may resolve them into their constituents. But as he also points out there is a great improbability of this being done in the sense that the gold "manufacturers" make their claims. The new elements, into which our later successful chemistry has broken up some of the supposed elements, are very closely allied physically and chemically with the so-called old elements of which they were part. It is notable that these new elements were impurities in the old ones, making mixtures with them. Finding them did not displace the known old element and take it out of the list. It merely added new ones that, by reason of imperfection of methods of investigation, had been overlooked. It is true that in the case of argon the five new elements which have been recognized in it all contributed to the physical and chemical definition of argon as it was first supposedly isolated, but the identification of the five was the splitting up of a mixture, not the breaking down of a chemical compound. The general popular idea has been quite the contrary. It is this popular idea that Mr. Booth's paper is designed to correct.

It would be desirable to have the co-operation of the daily press in correcting popular misinformation on such questions. Their tendency

seems, as a whole, to be the other way. The wilder and more improbable the fairy tale the more space and serious attention the tale seems to receive. The writers of the stuff take no responsibility for the popular opinion it moulds and are swift to condemn and consign to their oblivion the tales of the fakir when the public wants a new spice for discussion.

THE California State Railroad Commission, rehearing the petroleum oil rate cases, have rendered a decision reducing the rates from Kern, Cal., to San Francisco and other California points about 11%. The switching charges against which complaint was made have on the rehearing been cut down 50%, though on the original hearing they were not reduced. The effect of the order of the Commission reduces the carload rate \$10.35 from Oil City, Cal., to San Francisco. The opinion in the case is a clearly written logical argument. It is notable in that its reasoning is based solely on the cost to the railroad of the particular service, the transportation of the oil from the wells to points of use. The Commission has ignored, as irrelevant and immaterial, the mass of testimony put before it as to freight charges on other commodities between the same points or other points. Accepting the outside statements of the railroad companies themselves as to the cost of the service, and basing the rate they order on it, the only possible question that could now be raised by the railroads would be as to the reasonableness of the profit margin the order allows. This the Commission in its formal opinion says is 44%. This percentage is greater than the average earning of all its freight traffic as shown by the annual statements of operation of the roads. The last opinion and order of the Commission is in form and substance an improvement on the one it replaces. It not only improves the condition of the petroleum industry to the extent of the reduction, but its method of reaching conclusions establishes a precedent under which the Commission can examine intelligently into freight charges made on other commodities and can correct them when proved inequitable. The way would seem clearly opened for securing to the miners of California an equitable, fair establishment of freight rates on ores, in which there is much inequality. The railroads running out of Cripple Creek, Colo., have recently on their own initiative put into effect flat rates on ore independent of its commodity value. There is no logical reason why this should not be the established rule in California. The California Railroad Commission would have to reverse its own precedent in ordering into effect rates based on values of metal contents.

THE U. S. Supreme Court decision in the Philippine case making exports from the United States to the islands free of tariff, is, until Congress establishes a tariff, which it has the right to make under the Porto Rico decision, an opportunity for the development of the mineral resources of the island. The Pacific coast is most favorably situated to take advantage of this opportunity. Mining tools, machinery and special supplies are not in stock in the islands and the opening and working of mines is at a disadvantage in consequence. Sufficient is already known of what the metal mines of the islands are to make possible the intelligent selection of mine supply stocks. The tariff of high extra costs of mining plant and supplies does not delay or prevent their introduction into a new mining country during periods of popular excitement and misinformation as to the richness of the mines, but when such periods are past and mining, like everything else, is conducted as a business, extra costs of plant and supplies do delay and prevent their introduction as commercial stock. There is no illusion as to what Philippine island mines are, and every advantage should be taken, which, in reducing costs of plant and supplies, adds to the possibilities of profit.

ARIZONA has sufficient population and property value to become the forty-sixth State of the Union. Eastern Congressmen point to Nevada as an example of arrested development, and maintain that the same thing may happen to Arizona. This is unfair to both of those mining commonwealths. Nevada is attracting renewed attention, and as her mineral resources are developed will increase in population. Arizona will never have less population than it has to-day.

Concentrates.

WATER absorbs more heat than any other liquid, due to the fact that it contains no carbon.

THE principal requirement in moving air economically is to keep pressures and velocities low.

IN Montana hoists, flat wire rope, about $\frac{1}{4}$ inch thick and 6 to 8 inches wide, is mostly in use.

THE watt equals 44.26 foot-pounds of energy, or it is the work done in lifting 44.26 pounds weight 1 foot.

PLATINUM has been found associated with chrome iron in Siberia on the eastern slope of the Ural mountains.

AMONG several simultaneous inventors exclusive ownership rests with the one who first receives the patent.

IN a case of dispute of ownership over an unpatented mining claim, the burden of proof is always on the jumper.

PLUMBAGO, or graphite, practically pure, is made artificially at Niagara Falls, N. Y., in an electric furnace. The raw material is coke powder.

WHERE the end lines of a mining claim have been established they remain the end lines as to all veins found within the surface boundaries.

IT is permissible to do two years' assessment work on unpatented mining claims, "at one time," by doing half the work this month and the other half next month.

IN running a survey in an easterly or westerly direction in the northern hemisphere a line always bears to the south as a result of the convergence of meridians.

AT the Hidden Treasure placer gold mine, Placer Co., Cal., the mine is lighted by electricity, and the gravel handled by electric power generated solely by the mine drainage water.

A COAL BUNKER 30 feet wide at the top, 31 feet wide at the middle, 27 feet wide at the bottom, 18 feet long, 20 feet deep, will hold 702.7 tons of coal, allowing 45 cubic feet to the ton.

INQUIRIES for asbestos deposits and for the mineral are becoming numerous. Prospectors who have deposits of this mineral will find the present time an opportunity to interest capital.

THE number of alloys that can be made is innumerable. It is believed that of all that have been made not more than 200 have so far been found valuable and useful. Unquestionably many more that will be useful will be found.

ALL concrete is more or less porous, and if absolute water tightness is required a layer of waterproof material, such as asphalt or petroleum wax, must be used, or the wall must be given some coating which will fill the pores.

FOR the ten months ending with October, 1901, imports of silver into the United States were \$25,561,660, and exports \$26,225,618. Net exports were only \$663,958, so that practically all of this year's domestic production of silver remains in the United States.

CONCRETE LINING 2 feet thick is to replace the timbering in two tunnels on the Great Northern Railroad near Helena, Mont. The reduction made in the cost of cement has made it economical to make this change of construction practice for railroad tunnels.

THE United States Land Office including the Cripple Creek, Colo., district has made a ruling in an adverse claim case between conflicting locations near Cripple Creek that neither was entitled to the disputed ground, both claimants having been guilty of laches.

IT is estimated that, using all precautions, in boring with a diamond drill in rock having a hardness of seven, about one carat of diamond is lost for every 15 feet bored. The cost of the diamonds ranging from \$15 to \$70 a carat gives a range of cost per foot from \$1 to \$4.66.

IDAHO placer miners in Camas Cove mining district, which includes the Tyson placer mines, have a contest with timber scrippers for the lands started. The latter are employing the same kind of tactics used by the scripper to gain possession of the petroleum bearing lands in California.

THE report of the State Mine Inspector, who investigated the recent accident at the Smuggler-Union mine, Telluride, Colo., by which twenty-five men lost their lives, says the fatalities appear to have resulted from a failure on the part of those present to realize the danger until it was too late to avert it.

THE mere fact that an inventor is, at the time of his invention, in the employ of the Government, does not transfer to it any title or interest therein. There is no difference between the Government and any other employer in this respect, this general rule being subject to limitations only in case of public necessity.

THE air flasks that hold the compressed air under several thousand pounds pressure have been rapidly evolved during the last few years, so that now are produced in this country nickel steel flasks, not only twice the strength of those formerly used, but which are absolutely incapable of rupturing under the pressure used.

EVERY new mining law instead of settling the right of property simply increases litigation. Colorado devotes fifty pages of its statutes dictating how mining locations shall be made and maintained, but litigation over mining

claims in that great mining commonwealth is more common than in California or in any State that has no special statutes regulating locations.

VARYING the grade of the matte by feeding the furnace at different heights varies the slag composition as to its silica and iron contents, and makes the feeder the real metallurgist. The reducing action in the furnace is effected almost entirely by the gases, and when these are allowed to go to waste, reduction ceases.

MACHINES to automatically weigh gold coin are in regular use in some Eastern banks. The gold coins are accepted at weight by the banks there and the machine, to which they are fed through a hopper, sorts the coins and weighs them, returning the full weight coins to one compartment and the underweight coins to another.

TO GET 5 effective H. P. from 20 inches of water would require that the water should have a fall of 100 feet or a head of 100 feet. To use such a head would require a tangential wheel with the water striking the buckets with 100 feet of pressure. An overshot water wheel would have to be considerably over 100 feet in diameter to give the 5 H. P. from 20 inches of water.

THE chrome iron deposits in California are largely pockets in serpentine country rock. The mining of them is very uncertain. The pocket may be a few hundred pounds or as many tons. So far there is little commercial value in the mining. It has only paid wages to miners. Uses are, however, extending, and these California deposits are among the principal ones in the United States.

THE Institution of Civil Engineers, the Institution of Mechanical Engineers, the Institution of Naval Architects and the Iron and Steel Institute have formed a committee, including Sir B. Baker, Sir J. W. Barry, Sir F. Bramwell and others, which has been going thoroughly into the question of the standardization of iron and steel with a view of forming a permanent standards committee for Great Britain.

THE Supreme Court of California in the case of Reese et al. vs. the Bald Mountain Con. G. M. Co. established the rule that when a mine is operated under a bond or lease the workmen cannot hold the mine for their unpaid wages by virtue of a lien, even when there is no notice disclaiming responsibility on the part of the owners. The court held that labor in the mine is not the same as a building or improvement constructed upon lands and as such entitled to lien.

THE late decision of the Supreme Court of the United States making a ruling which construes the statute requiring the discovery of valuable mineral as a condition precedent to the right of location to except blanket formations is to the effect that, if a location is made in a section where there exists a known blanket vein, and A should make a location and go to work and B should follow suit and first reach ore, the latter's success would not oust A from the ground he claimed.

AT the converter of the Granby Co., at Grand Forks, B. C., the copper matte is converted into copper blister. The matte as it comes from the smelter carries from 50% to 65% metal. When it has been passed through the converter it carries from 92% to 98% copper and comes out in the form of blistered copper, having lost from 500 to 900 pounds weight of useless material in the refining process in the converter. It still carries, however, the gold and silver. This refined product is sent to New York for treatment.

REGISTRATION is a safeguard against the issuance of certificates of stock in excess of the company's authorized capital. Where stock is registered there is printed on the certificate itself a notice that it is not valid until countersigned by the registrar. This counter-signature is evidence that the shares represented by such certificate are part of the authorized capital of the company. It assures the holder that his certificate is issued only against the cancellation of a like number of shares of the original stock of the company.

MOUNT MCKINLEY, with an altitude of 20,464 feet, is the highest mountain in North America and forms the central point of an enormous and surpassingly grand mountain mass, situated at the headwaters of the Sushitna and Kuskowim rivers, in Alaska. Mount McKinley was known to the Russian settlers about the head of Cook Inlet nearly 100 years ago, and was called by them Bulshala—that is, Big. The first American to see and publish an account of it was a prospector named W. A. Dickey, who gave the mountain its present name.

WHAT was said in this paper regarding anything in mining or metallurgy twenty years ago, or ten years ago, or three months ago, might not be so now. A journal chronicles the state of the art at the time of its publication. As new discoveries are made and science progresses the facts change, and what this journal or any other mining journal said one year ago may be squarely contradicted by what it says this week or may say next week. Facts change and the fact of to-day may be the fallacy or error of to-morrow. It isn't a question of "consistency," but one of progress.

THE gold in the "banket," or conglomerate in the Transvaal deposits, is not found uniformly disseminated through the bed, which may be several feet thick, but is concentrated in what can be identified as the original bottom side of the bed when it was formed. This enriched portion is in places only 6 inches thick and rarely exceeds 30 inches. The remainder of this bed is barren

or at least too poor to pay the milling costs. The mining practice is to take out as little waste as possible with the pay rock. The great gold yield of the conglomerate is not due to its thickness, but to the great uniformity of value over the entire area of deposit. There are no true pay shoots in the conglomerate beds comparable with pay shoots in fissure veins.

IN electrical work an alternating current is one that is continually reversing its direction of flow, and is generally understood to be a current that reverses its direction at every pulsation. A good example of an alternating current is that which is produced by an ordinary magneto-generator; such as is used in telephone work. A magneto-generator is made up of a single coil of wire which is revolved between two magnetized pole pieces, the terminals of the wire being connected to two points which are kept continually in contact with the exterior circuit by means of brushes.

THE questions received to which the items on this page are answers are rarely published, the answer being indicative of the query and giving all that is needed, the statement itself being published in the shortest possible form. To publish the questions and to furnish the answers other than in this condensed way would transcend the limits of our space. If the answer to a question does not appear within a month after its receipt, it is an unusually hard one; it is not forgotten—only delayed. A question often involves considerable research—and then the answer may be in three lines.

THE Supreme Court of Idaho has made a decision that the filing of the articles of incorporation of a mining company, wherein the locators of a mining claim turn in their location in exchange for stock, constitutes a valid conveyance without a deed or other evidence of transfer. The case began as an adverse claim filed by the locators of the Havenor claim at Silver City, Idaho, against the Murray Hill Co., claiming that the conveyance being invalid, the work performed by the company did not prevent the forfeiture of the rights of the locators when they ceased to do assessment work.

EXTRALATERAL underground rights are often the most valuable obtained by a lode location. The statute requires that end lines of a lode location shall be parallel. Unless end lines or portions of them can be placed upon other patented claims, there will be many tracts of mining ground lying between irregular-shaped patented claims to which the mining laws will have no application. Unless the locator can place the lines within, upon or across adjoining or intervening property of another, he must choose between the loss of surface and the veins beneath, and the loss of the extralateral ground portions of the vein.

THE material which has the greatest strength for a given weight is the best for a flywheel. The explosive force increases as the square of the speed. Pine wood has a greater tensile strength than cast iron, and is much safer for a flywheel. For an engine running at a speed of 100 revolutions per minute, a properly constructed wood-rimmed flywheel is safe. Where the speed of the engine runs above 100 revolutions per minute, to keep the rim speed down to 5000 feet per minute the diameter of the flywheel can not exceed 16 feet. A balance wheel to run at a surface speed of 10,000 feet per minute has been constructed by winding a square steel wire on a cast iron spool.

THE date line coincides with the meridian 180° from Greenwich. It deflects between north latitudes 80° and 45°, so that all Asia lies to the west, all North America, including the Aleutian Islands, to the east of the line; and between south latitudes 12° and 50°, so that Chatham Island and the Tonga group lie to the west of it. A vessel crossing this line to the westward sets the date forward by one day, as from Sunday to Monday. A vessel crossing the line to the eastward sets the date back one day, as from Monday to Sunday. Hawaii has the same day name as San Francisco; Manila, the same day name as Australia, and this is one day later than the day of Hawaii. Thus, when it is Monday, Dec. 9th, at San Francisco, it is Tuesday, Dec. 10th, at Manila. An extended, scientific, illustrated detailed explanation of this whole matter appeared in the issue of Dec. 3, 1898.

THE amount of land which one person may acquire under the U. S. placer mining laws is unlimited, but the amount which he may acquire by a single location is limited to twenty acres, and an association of two or more persons, not exceeding eight in number, may make a single location of an area not to exceed twenty acres for each locator, thus making 160 acres for each eight persons. These locations when on surveyed public lands must conform as near as practicable with the United States system of public land surveys and the rectangular subdivisions thereof. A single discovery is sufficient to hold an entire location of 160 acres by an association, and discovery need not be made upon each twenty acres thereof. Upon application for a patent, however, legal subdivisions of such a group location which are shown to be valuable chiefly for agricultural purposes, may be excluded from entry for patent. Upon each location, whether of twenty acres by an individual, or of an amount not exceeding 160 acres by an association, \$100 worth of labor is required to be performed for each year beginning with the 1st of January next succeeding the date of location, until the claim is located in the Land Office for patent. Such labor may be performed upon one only of a group of locations if the total value thereof equals \$100 for each location, and if such labor will inure to the benefit of each location within the group.

Late Gold Dredging Practice.*

NUMBER VI.

Written for the MINING AND SCIENTIFIC PRESS
by RALPH L. MONTAGU.

In Fig. 15 I have shown a plan of the wiring and connections and necessary instruments for a dredger

lecting rings of this type than with the commutator of a direct current machine.

These motors are started, stopped, reversed and their speed is regulated by means of a controller similar in outline to that used for a direct current series wound motor. Fig. 16 shows the necessary wiring, etc., for a dredger (Figs. 1 or 2) where the current consists of a three-phase 1000-volt alternat-

a system of wiring for direct or alternating current, whereby one ammeter can be used on each individual circuit without interfering with any of the others, but the saving effected in first cost if this is used does not, I believe, compensate for the advantage to be gained by having a meter on each separate circuit.

On account of the size and weight of the wires

of types Fig. 1 or 2; for a direct current system, the different classes of motors are shown in outline.

The best location for the switchboard is in the pilot house, the starting devices for the motors that drive pumps, grizzlies or any other machinery that is not controlled by the operator, should be located as near their respective motors as possible. The controllers for the motors that drive the bucket chain and the winch should be placed in such a position that they are within arm's length of where the operator stands when the dredger is working.

I have not shown the individual light circuits, but this plan being intended for a 500-volt direct current system, five incandescent lights have to be connected in series between the mains. The branch wires for lights should be taken off the mains before they (the mains) are connected to the main switch.

It was as recent as 1888 when the theory of the rotating field motor was first discovered; this made possible the use of the alternating current to operate self-starting induction motors.

There are two types of alternating current motors that can be used on a dredger, viz.:

(a) The short circuited secondary induction motors, and, (b), the external dead resistance (in secondary) induction motor.

These motors correspond as regards their speed and starting torques with the shunt wound and series wound current motors respectively.

In starting the (a) type of motor an arrangement of transformers is effected whereby a reduced voltage is delivered at the terminals of the motor in order to prevent an excessive flow of current, and as soon as the motor has attained its speed the transformers are cut out of the circuit. These motors present a very simple outside appearance. There are only the terminal blocks to connect the wires to, no brushes or commutator, as on the direct current motors.

The type (b) motor has a set of three or more collecting rings on the shaft of the armature or rotating element, with their necessary brushes, but there is considerable less trouble experienced with the col-

ing current circuit.

Transformers are needed to reduce the voltage from 1000 to 400 for the smaller motors, because alternating current motors of a size less than 50 H. P. are usually wound for a voltage of 200 or 400, and to supply a low pressure current (100 volts) for the incandescent lights. It is a distinct advantage to have a Stillwell regulator connected in the light cir-

needed to carry the current, I am in favor of bringing aboard the dredger a current at a pressure of not less than 1000 volts, where the alternating system is used, and where very powerful machinery is used this voltage could be increased to 2000 without danger.

As a dredger is constantly moving, some means have to be devised for keeping the electric connec-

cuit so as to keep the lights steady.

In practice not more than twelve incandescent lights should be connected in any one circuit. As will be seen from a comparison between Figs. 15 and 16, the alternating current needs a more complicated arrangement of wires. The same remarks in regard to meters, etc., that have already been written in reference to direct current systems apply to alternating current systems.

If it should be necessary, I have shown at Fig. 17

tion with the pole line on shore constant.

In some cases a special cable is made containing the two or more conductors insulated from each other. This cable is supported on a number of small pontoons and the slack cable is coiled up on shore and left on the damp ground in a number of cases. A better method to accomplish this object is to have a special reel made and placed on the dredger (Fig. 18); the wires from the reel are connected to the pole line, and when it is necessary to pay out or take

up slack no time is lost and there is no danger to the man from an electric shock.

The reel should be made of thoroughly seasoned hard wood and painted with a waterproof insulating paint. The wooden shaft is stationary and two brass

and wires leading to the switchboard are connected to the sleeves, as shown in the illustration. Hand spokes are placed on the periphery of the reel to facilitate rotation when necessary.

I do not think it necessary to go into a lengthy de-

Silver Mining Will Pay.

Will silver mining pay? is a question often asked, and it is to be admitted that valuable mining properties are condemned simply because they are silver

sleeves are firmly attached to and thoroughly insulated from it; brass hubs, which freely revolve on these sleeves, are attached in a similar manner to the reel. The ends of the flexible wires from the pole line on shore are connected to the brass hubs,

scription of electric power plants, as that subject has been dealt with by a number of writers and at great length, but the description given here of the electrical equipment of a dredger is, I believe, new. (TO BE CONTINUED.)

mines and for lack of a satisfactory answer to this question. The purpose of this article is to demonstrate that silver mining will pay with the same economy now practiced in successful gold mining attending, and with greater returns on a like invest-

ment, notwithstanding the extremely low price of silver.

Within a radius of 15 miles of Lovelocks, Nev., are several famous mines noted for their past records as silver producers. These silver mines were operated more than thirty years ago, when everything in the mining and milling line was necessarily high, particularly so when compared with the ruling prices of the present day. Silver, however, was then worth from \$1 to \$1.29 per ounce. This made it possible for silver mines to pay handsomely, regardless of the remoteness from civilization and the high prices of the commodities incident to their operation. While silver was then worth in the neighborhood of twice as much as it is to-day, we find more than a counterbalance in the fact that all the commodities used in silver mining and milling are procurable to-day for less than one-half what they were thirty years ago.

We will make a few comparisons of the prices of the principal commodities used in silver mining then and now. These figures are taken from authentic records, furnished from reliable sources, and represent cost delivered at the mines:

Powder, former price, 35c per pound, now 15c; fuse, formerly \$2.50 per 100 feet, now 85c; caps, formerly \$2.50 per 100, now 85c; candles, formerly \$7.50 per box, now \$2.50; picks, formerly \$2.50, now \$1; shovels, formerly \$2 each, now 85c; hammers, formerly \$2.50, now 85c; pick and drill steel, formerly 25c per pound, now 11c; track iron, formerly \$200 per ton, now \$60; mine timbers, formerly \$125 per M, now \$35; blacksmith coal, formerly 10c per pound, now 4c.

Water and air pipe are now procurable at about 25% of their former cost.

The only item that has not been correspondingly reduced is that of miners' wages. However, the old scale of wages could be well maintained and the same mines pay handsomely, for with the modern machinery the miner can do twice the amount of work he formerly did in the same time.

The machine drill, in itself and alone considered, is convincing evidence of this last fact. Now we will make a few comparisons of the relative cost of the expenses in connection with the milling of silver ores, assuming that these ores would be subjected to the same treatment, necessitating the use of the same chemicals that were in use thirty years ago, which is not the case by any means. Simpler and less expensive methods are being used at the present day—the result of strides in the science of metallurgy for the intervening thirty years—which we will not take into consideration.

Quicksilver, former price at mills, \$125 per flask of seventy-two pounds, now \$55.

Bluestone, former price 25c per pound, now 3c.

Salt, of which a considerable quantity was used, was gathered in an impure state from the salt marshes and fed to the mills without first being refined, increasing the milling cost in this item, since the salt crust rarely contained over 35% of salt, to about three times what it should have been, not to speak of the extra cost of running through the mill the 65% of waste contained in the crude salt cake. The impure article cost \$25 per ton, now the pure rock salt is obtainable for \$20 per ton. Other chemicals of minor importance are to be had at about 40% of their former cost.

The cost of power, the principal milling item, formerly about \$1.50 per H. P. for every twenty-four hours, can now be had for about 40c. And the same power in the same time will reduce more ore than formerly on account of the greater efficiency of modern mills.

With the progress that is being made in the use of hydro-carbons as fuel for generating steam, the cost of mill power will admit of much greater reduction than the price named as the present cost. On the whole, the milling cost of reducing ores would be less than 40% of the former cost.

Everything considered, where are the inducements greater for the profitable investment of capital than in the operation of our silver mines? With mining reduced to the science that it is to-day, silver mining must be profitable.—Lovelock, Nevada, Tribune.

C. J. JOHNSON of St. Louis, Mo., claims to have discovered a process for hardening metal articles for which he claims many advantages. The articles formed must be at a white heat. They are cooled to a cherry red heat by directing a current of air on them; then submerged in a bath or solution made up as follows: Sal soda, 1½ parts; resin, 1½ parts; animal oil, 3 parts, which is mixed in water. The relative proportions of the above ingredients may be varied slightly, but the figures given are approximately the ones used in practice.

SCIENCE is ready to build a telephone circuit completely around the earth. So far as invention is concerned, the work is done. It is now a question for capital. It involves a cable laid across the Atlantic ocean from New York to Southampton, and after passing under the English channel, by way of Paris, Berlin, Vienna and Constantinople across Asia to Calcutta. Thence it would follow the Chinese coast to Behring straits, where, crossing over to Alaska, it would run southward to San Francisco and thence back to New York.

Can Gold be Made Artificially?

Written for the MINING AND SCIENTIFIC PRESS by EDWARD BOOTH.

Within the past few weeks a number of articles have appeared in the daily papers announcing that a Colorado assayer named Wynn has discovered a method of making gold; and the further statement was made that the discovery has caused much excitement and is believed in by careful, shrewd, business men. An account is given of one test in which ore shown by ordinary assay to contain \$1 yielded by the Wynn process \$44 in gold. It is all accomplished, as is lucidly explained in the telegrams, "by a combination of acids," and the discoverer very naturally refuses to give up the combination.

There is a possibility, but an extreme improbability, that Mr. Wynn may have found the philosophers' stone, sought in vain by the old alchemists, and may have learned the secret of the transmutation of the metals. No one familiar with chemistry would pronounce such a thing absolutely impossible, however improbable. Gold has always heretofore been considered an element—something that could not be made because of the impossibility of finding anything simpler from which to make it. When chemistry was in its infancy gold was the quest of the pioneers in the science. The alchemists, purposely enveloping their work in mystery and regarded as in league with the devil, worked with all the materials at their disposal to this end, and failed. And all the works of their successors have been as unsuccessful.

If gold be actually an element, it is, of course, impossible to make it from anything simpler—it cannot be built up from its constituents because it has no constituents. The only way to make it would be from unrecognized gold compounds. Mr. Wynn claims to have made gold from talc; and he might argue that the talc, or some part of it, is a compound of gold, but this supposition is as likely to be untrue as is the first.

The whole question as to the possibility of making gold depends on whether our so-called elements are really such. If not—if they be really compound substances, be made up of simpler substances—then anything in the way of transmutation of metals becomes a possibility. And it is because of ignorance on this point that chemists are unable to absolutely condemn such a discovery as that reported to have been made in Colorado. Chemists do not know whether the elements really are elements or not. The evidence is almost wholly negative. Certain things, such as gold and silver, are called elements because they are not known to be compounds. But it has not been an unusual incident in the history of chemistry for a so-called element to be proved to be a compound. Sir Humphrey Davy, nearly a century ago, succeeded by means of an electric current in proving that soda and potash, then considered elements, really contained the metals sodium and potassium, since regarded as elements, because no later Davy has found a way of breaking them up. Still later, Lord Rayleigh and Prof. Ramsay, after a thorough examination as was possible at the time, pronounced argon an element, only to modify their opinion a few months later and announce the discovery in it of at least five elements. And latest of all—in fact, later even than the Colorado gold discovery—comes an announcement from the Harvard Observatory that indications had been obtained pointing to the probable compound character of hydrogen, one of the most carefully and thoroughly studied of all the elements.

With a knowledge of such facts, and with the further knowledge that certain inexplicable relations exist among the different elements in their weights and in their chemical behavior—relations indicating some kind of a connection not yet discovered—it would be foolish to pronounce the Colorado discovery an impossibility.

That it is an extreme improbability may easily be shown. Up to the present time the most painstaking and skillful investigations, conducted by the most learned experimenters with the best obtainable apparatus and methods, have given no indications whatever that gold is not an element. It is not at all likely that a man ignorant of chemistry and of chemical methods and working with imperfect apparatus should have discovered what more learned men have absolutely failed in. If this were unexplored ground, the case would be different; but the very causes that led to his investigations have carried hundreds of others into the same field of work, and all have failed.

Moreover, it must be remembered that while the compound characters of some supposed elements have been proved, it has not been an easy task, and has frequently been achieved only after the discovery of new methods of work. Davy isolated sodium and potassium by using the power of electricity in analysis—a new power in his time. Rayleigh and Ramsay broke up their original argon into its parts by using the extreme cold of liquefied air—a method never before possible. And Prof. Pickering, who claims to have discovered evidences of the compound character of hydrogen, did so by photographing the spectrum of a streak of lightning.

Reported discoveries of methods of making gold—common enough in ancient times—are not uncommon

at the present time, and each, no matter how improbable, finds believers, and believers, too, who are described as shrewd business men. All old Californians remember the claim made a few years ago that a method had been found of extracting gold from the waters of the Calistoga springs. And only a couple of years ago two of the most notable of these gold schemes came to untimely ends in the United States. One of these was like that of Wynn, and professed to make gold from material known to be free from it. The other was of a different order. It was the alleged discovery of the "Rev." J. F. Jernegan, who asserted that he could recover gold from sea water in profitable quantities. He announced that he had invented an electric device which he called an accumulator. This apparatus—a small receptacle containing mercury—was sunk in the sea after having been connected with an electrical machine on shore. At the end of twenty-four hours it could be raised and from the mercury could be obtained gold to the value of \$1.27. A company was organized, money flowed in, investors were given every opportunity for investigation—were allowed to furnish their own accumulators, sink them in the sea at the company's wharf and watch until the requisite time had elapsed. Then they could take the mercury away and have it worked as they might wish. And always it produced gold. For a long time the scheme was worked successfully, and it was only a disagreement about salary that finally caused the diver who was employed to walk out under the wharf and "salt" the accumulators to expose the fraud.

It was during this same time that Edward C. Brice was making gold in Chicago. He told a story a good deal like that told by his Colorado successor. While working as an assayer in the Black Hills he had studied nature's way of making gold and had finally grasped the secret. He made less of a mystery of his process, however, than is customary.

"Take an ordinary crucible," he said, "and place in it a layer of powdered charcoal. On this put a layer of sulphur, then another layer of charcoal; next a layer of iron filings, and finally a top layer of granulated antimony. The contents of the crucible must be fused together and will then show the presence of a large quantity of gold."

A company was organized and stock rapidly rose in price until it was largely sought at \$400 a share. A big gold factory was erected and work went on night and day. When the news of the Jernegan fraud reached Chicago the stockholders became anxious, began an investigation and the works closed. That was the latest gold making until this recent Colorado scheme came to light.

Reduction and Refining of Copper by Electrolysis.

The Hoepfner process for obtaining copper and other metals directly from the ore or concentrate by electrolysis was first described in 1891. Several plants have been erected to put it in operation, all of which have been more or less unsuccessful when applied to copper. The latest of these was built at Papenberg in 1898, but no authentic account of its industrial success has been obtained. The same process was tried in America with copper-nickel matte from Sudbury, Canada, but resulted in failure for the reason that the metals produced were spongy and below the merchantable standard of purity.

Under this process copper ores or concentrates are pulverized and then dissolved in a chlorine solution, which is treated in tanks made of wood impregnated with asphalt and lined with sheet lead. The anodes are of carbon, the cathodes of sheet copper, and they are separated in the bath by a diaphragm of cloth. The solution being decomposed by the action of the electrical current, the copper is deposited in crystals of pure metal on the cathode, while the chlorine thereby released remains in the stream of solution directed against the anode, and by combining with the protochloride forms bichloride of copper. The solution thus charged is then withdrawn from the tank, heated, and used in leaching fresh ore to obtain the original solution. The leaching process is a cycle, in which the solution is pumped up and passes through the pulverized ore again and again without addition of chemicals, and it is claimed that in working Rio Tinto ores containing 2.37% copper, 91% of the copper can be leached out in four hours, while only 3% of the iron pyrites in the ore is dissolved. The leaching process is quickened by agitating the mixture of ore and solvent either in revolving drums or in stationary tanks by the injection of currents of air. Professor Schnabel gives the efficiency of this process at ninety pounds in twenty-four hours for each horse power converted into electrical current and passed through the precipitating circuit, but he declines to indorse the process as practically useful when applied to the refining of copper.

THERE are many problems connected with the use of explosives in rocks of different hardness, and with different angles of incidence of the tunnel on the strike of the bedding and cleavage planes of the rock, on which more knowledge is desirable. With such knowledge, it is possible some general rules of practice in drilling and blasting can be formulated that will lessen average costs and reduce the average consumption of time.

Mountain Roads.*

NUMBER II.

By JAMES W. ABBOTT.

Cribbing is temporary in character, its use costly, and always to be avoided wherever practicable. When indispensable, it should have a batter not steeper than one horizontal to four vertical. Roads excavated in solid rock should have an inside batter of one horizontal to four vertical. This affords some latitude for projecting loads, which might otherwise be crowded off the road.

Roads excavated in plowing or picking ground should have a batter of one horizontal to one vertical; in other words, the inside bank should have a 45° slope. Where steeper, there is too great injury from ice and water. This batter can always be secured without excessive cost. On sidehill grades made for wagon roads an outside bank made of loose material can generally be depended on to stand permanently at an angle of 40° with the horizon. If made of rock, it will sometimes stand at a steeper angle and sometimes not, depending upon the tendency of the rock to disintegrate, so that it is best to adopt a 40° slope as a basis for estimates. Dry stone retaining walls should be used only where indispensable, and should never be steeper than one horizontal to two vertical.

WIDTH.—Cost, amount of traffic, safety and comfort are the factors which must determine the width of a wagon road. Comfort and convenience are, of course, promoted by a double track. Extensive traffic demands it. Safety requires so much of it that teams can pass and never be caught unawares on a single track.

The proper width for double track and heavy teams is 16 feet, while it is possible for them to pass with extra caution on a 14-foot track on a straight road. For single track and greatest safety a desirable width is 12 feet, while 10 feet is generally safe, and an 8-foot roadbed can be driven over if the inside bank has sufficient batter, so that vehicles will not be crowded off.

Double tracks for turnouts should never be less than 75 feet long. These should be visible from each other and from every foot of the intervening distance. Before laying out a road, the maximum distance between turnouts should be determined from all the conditions, especial consideration being given to the amount of travel likely to occur at night, and this maximum should never be exceeded. Where the conditions make it imperative to establish this maximum at over 100 feet for turnouts adapted to heavy traffic, it is well to widen the road for short distances at intervening intervals for light vehicles. A width of 12 feet will allow light vehicles to pass each other in emergency. Where the utmost economy must be observed, this extra width for a short turnout can be secured by cutting into the bank previously constructed with proper batter. Of course, it makes the inside bank too steep at these places, but it is a choice of evils in the interest of greater convenience and safety to light traffic.

It is obvious that in sidehill grades excavated in picking or plowing ground that portion of the road that is formed from the original material in place must for a time be more solid than the portion built out. It is, consequently, desirable on roads designed for very heavy traffic that all the wheels of heavily loaded wagons should rest upon the original solid formation. Standard vehicles are either 4 feet 6 inches or 5 feet between the centers of the tires. A very heavily loaded wagon can not be restricted to the same width of roadbed as light vehicles, but should be allowed a latitude of 8 feet for varying conditions of draft, road surface, etc.

A hillside composed of picking or plowing ground is rarely ever steeper than 35°. A hillside grade formed by cutting 8 feet into such material makes an excellent roadbed. The inside 8 feet of it is solid from the first and adapted to the heaviest traffic, and the balance, made by the fill, is sufficiently wide to allow lighter wagons to pass. The following table shows the total width of such a roadbed for various sidehill slopes and the amount of material which must be excavated for each 100 feet of roadbed:

| Sidehill slope. | Width made by fill. | Total width. | Excavation per 100 feet. |
|-----------------|---------------------|--------------|--------------------------|
| DEGREES. | FEET. | FEET. | CUBIC YDS. |
| 5 | 7.89 | 15.89 | 11.26 |
| 10 | 7.83 | 15.83 | 25.33 |
| 15 | 7.72 | 15.72 | 43.41 |
| 20 | 7.52 | 15.52 | 76.41 |
| 25 | 7.29 | 15.29 | 103.31 |
| 30 | 6.87 | 14.87 | 161.78 |
| 35 | 5.94 | 13.94 | 276.59 |

The following diagram and mathematical discussion are given to show the method by which the results presented in the table were obtained.

In the following the inside bank is calculated with a batter of 45° (one to one) and the outside one with a batter of 40°. The results of any other depth of cut may be quickly obtained from the table by simple proportion. For instance, for a cut of 7 feet into the

bank the total width of roadbed would be seven-eighths of the figures in the table; for a cut of 9 feet the total width would be nine-eighths; for a cut of 10 feet, ten-eighths, etc.

Applying to this a 25° slope, we find that a 10-foot cut into the bank gives a total width of 19.11; a cut of 9 feet gives 17.20; one of 7 feet, 13.38; one of 6 feet, 11.47, and one of 4 feet, 7.64.

$$\begin{aligned}
 A &= cad = \text{sidehill slope.} \\
 x &= bd = \text{vertical depth of cut.} \\
 1 : \tan A :: 8 + x : x. & \quad x = \frac{8 \tan A}{1 - \tan A} \\
 z &= ea = \text{width of road made by fill.} \\
 z + 8 \text{ ft.} &= \text{total width of road.} \\
 y + gf &= \text{vertical depth of fill.} \\
 yz &= 8x. \quad z = \frac{8x}{y} \\
 z &= y [\tan (90^\circ - A) - \tan 50^\circ]. \\
 8x &= y^2 [\tan (90^\circ - A) - \tan 50^\circ]. \\
 y &= \sqrt{\frac{8x}{\tan (90^\circ - A) - \tan 50^\circ}}. \\
 z &= [\tan (90^\circ - A) - \tan 50^\circ] \sqrt{\frac{8x}{\tan (90^\circ - A) - \tan 50^\circ}}. \\
 z &= \sqrt{8x [\tan (90^\circ - A) - \tan 50^\circ]}.
 \end{aligned}$$

Amounts of material which must be excavated increase or decrease as the squares of the depth. To illustrate: For a cut of 7 feet the amount of excavation would be $\frac{49}{64}$ of the amount given in the table; for a cut of 6 feet, $\frac{36}{64}$; for a cut of 5 feet, $\frac{25}{64}$, and for a cut of 4 feet, $\frac{16}{64}$. The following tables show the total widths of roadbed and amounts of excavation for a cut of 6 feet and for a cut of 5 feet:

| 6-FOOT CUT INTO PLOWING OR PICKING GROUND. | | | | 5-FOOT CUT INTO PLOWING OR PICKING GROUNE. | | | |
|--------------------------------------------|--------------|--------------------------|--|--------------------------------------------|--------------|--------------------------|--|
| Sidehill slope. | Total width. | Excavation per 100 feet. | | Sidehill slope. | Total width. | Excavation per 100 feet. | |
| DEGR'S. | FEET. | CU. YDS. | | DEGR'S. | FEET. | CU. YDS. | |
| 5 | 11.92 | 6.33 | | 5 | 9.93 | 4.40 | |
| 10 | 11.87 | 14.25 | | 10 | 9.89 | 9.97 | |
| 15 | 11.79 | 24.41 | | 15 | 9.83 | 16.96 | |
| 20 | 11.64 | 37.89 | | 20 | 9.70 | 26.33 | |
| 25 | 11.47 | 58.15 | | 25 | 9.56 | 40.41 | |
| 30 | 11.15 | 91 | | 30 | 9.30 | 63.19 | |
| 35 | 10.45 | 155.59 | | 35 | 8.71 | 108.06 | |

In the above tables no account is taken of either increase or shrinkage in bulk of such material. On shallow fills of this nature the first effect would be a slight increase in bulk, which would tend to make the road a trifle wider, but the ultimate result would be practically what the figures in the tables indicate. That tendency always acting for the outside of the road to become lower and the inside higher must be overcome by repairs. We see from the tables that while we should cut 8 feet into the bank for a double-track road a cut of 5 feet will give a practical single-track road with only $\frac{25}{64}$ as much excavation, or that the double-track road requires more than two and one-half times as much excavation as a single track.

In sidehill grades in rock the conditions are very different. Rock excavations are made by blasting, which throws a large proportion of the rock down the hill, and consequently the material thus broken out can not be depended on with any certainty for fill. That which does remain available increases in bulk about 50%.

On rock slopes up to 20°, unless very smooth and slippery, a fill will stand, the natural friction of the surface being sufficient to hold it firmly. Above 20° this can not be relied upon, and any rock fills made on such slopes must be very carefully secured at the bottom to prevent sliding.

As stated above, while a bank made of broken rock will often stand with a steeper batter, it is not safe to figure on more than 40°.

When the natural surface of the rock is too steep to hold a fill it is often the better practice to cut the entire roadbed out of the solid rock. A roadbed on a solid rock shelf is absolutely secure and in no danger of giving way without warning, because cribbing becomes rotten or retaining walls fail. Such a roadbed for single track should be 10 feet wide, carefully protected on the outside by a guard log not less than a foot in diameter at the small end, firmly bolted to the rock. The amount of excavation in solid rock on different hillside slopes to obtain such a roadbed is shown in the following table, accompanied by diagram and mathematical discussion illustrating how the results were obtained.

The table below can be used for deeper cuts by remembering that the amount of material varies as the square of the depth of the cut. For instance, an

11-foot cut will require $\frac{121}{100}$ the excavation shown in the table; a 12-foot cut, $\frac{144}{100}$, etc.

| Sidehill Slope | | Excavation per 100 feet. | |
|----------------|----------|--------------------------|----------|
| DEGREES. | CU. YDS. | DEGREES. | CU. YDS. |
| 5 | 16.30 | 25 | 97.78 |
| 10 | 34.07 | 30 | 125.19 |
| 15 | 53.33 | 35 | 157.04 |
| 20 | 74.07 | 40 | 196.30 |

$$\begin{aligned}
 A &= bad = \text{sidehill slope.} \\
 x &= cd = \text{horizontal depth of cut.} \\
 4x &= bd = \text{vertical depth of cut.} \\
 1 : \tan A :: 10 + x : 4x. \\
 4x &= x \tan A + 10 \tan A. \\
 10 \tan A &= 4x - x \tan A. \\
 x &= \frac{10 \tan A}{4 - \tan A}.
 \end{aligned}$$

A preliminary survey of a contemplated line with some simple clinometer, determining the sidehill slopes for each 100 feet, and noting whether in solid rock or otherwise, will furnish the basis for an approximate estimate of the cutting, which is always by far the largest item of cost in a mountain road.

(TO BE CONTINUED.)

Granite and Syenite.

Granite and syenite look much alike to a casual observer. They cannot be distinguished by the texture. The essential constituents of granite are quartz, orthoclase (potash), feldspar and mica. This is simple granite; but in this rock also occur numerous other minerals, most of which cannot be distinguished without the aid of the microscope. Syenite consists of orthoclase, feldspar and hornblende—quartz not an essential constituent, but often occurs. Diorite differs from the above in the character of the feldspar. Its essential constituents are hornblende and plagioclase (soda-lime) feldspar. When quartz occurs it is called quartz-diorite, and when mica is present, as well, it is known as quartz-mica-diorite. Magnetite often occurs so abundantly in the fine-grained varieties as to give the rock a black color. Diorites range in color from light gray to green and black. Typical rocks are rare. They usually graduate from one variety to another, and the name is usually applied in consideration of the most prominent constituents. In California the granite of the Sierra Nevada contains the essential constituents of both typical granite and typical diorite—hence the name grano-diorite. Phonolite is usually rather fine-grained, dark and compact, and when struck gives out a ringing sound. It would be impossible to identify the rock without a great deal of knowledge of the rock-forming minerals. In the Black Hills phonolite the principal constituents are nepheline, sanidine, aggrine, noselite and sodalite—minerals familiar only to students of petrography. Porphyry is a name employed to designate a rock having distinct crystals occurring in a ground mass of finer grain, as quartz-porphyry and granite-porphyry, meaning a granite of even grain, in which occur crystals of feldspar. Porphyry does not mean any particular kind of rock, but has reference to the structure only.

In the early days of metal mining in this west half of America mine operators dreaded the time when their workings should reach the permanent water level, below which it was almost a sure thing that the rich oxidized ores which they were having smelted at a good profit would be found in the shape of sulphides, which were at that time termed "refractory ores." The richest sulphide ores of those days were first roasted, either in roasters or in great piles in the open air, where a layer of wood was followed by a layer of ore, more wood and more ore, until it became inconvenient to make the pile higher. The pile of ore and wood would burn for days at a time, and the sulphur in the ores, which caused the trouble in smelting, was driven off, leaving the roasted ore in good shape for smelting, or, in the case of high-grade gold ore, for milling. The great advance made of recent years in the arts of metallurgy and in the mechanical appliances used in connection with the smelting of ores has removed much of the expense of treating sulphide ores. The advent of the modern smelter and modern concentration machinery has still more reduced the class of ores formerly considered too refractory to admit of profitable mining. It is generally considered that strong veins of sulphide ores are more certain to hold out and to continue in the profitable class at great depth than those that are free from an admixture of sulphur in their combination.

GEORGE A. TREADWELL, who claims to be a copper mining expert, says: "Statistics have been prepared within a year which show that the world has 5600 copper mines and only twenty-eight of them dividend payers."

*From Year Book U. S. Department of Agriculture for 1900.

A Cyanide Mill of the Black Hills, South Dakota.

Written for the MINING AND SCIENTIFIC PRESS by
EVERETT B. SAWYER.

In June, 1900, several business men of Deadwood, S. D., having interests together in the Yellow Creek district, some 3 miles from Lead, built the Wasp No. 2 cyanide mill. It was a fifty-ton plant designed to treat some 18,000 tons of shale and quartzite ore that had an average value of \$8 to \$12 in gold and about 1½ to 2 ounces silver per ton. It was the low-grade ore left from rich pockets mined at earlier periods.

A rather steep hill millsite was chosen so that the ore is carried down by gravity. The ore comes from an open cut some 800 feet back of the mill and is trammed in trains of eight cars by one mule to mill bin above 4x10-foot grizzly leading to No. 2 Gates crusher. The crusher breaks to a 2-inch ring, thence it goes to a pair of 24x14 Gates rolls set at ½ inch, thence to second rolls of same size and make that crushes to about ¼ inch. From here it is elevated by a 12-inch belt elevator to a flat 2½-inch mesh screen set at 45° over receiving bin, thus giving about a six-mesh product for leaching. Over size goes back to second rolls.

This seems rather coarse crushing for so hard an ore, but the values are almost entirely on the cleavage planes and yield to cyanide readily. The leaching room had four tanks each of fifty-four tons capacity. At first the tanks were filled by a dry car, but later a belt conveyor automatically fills a tank in an hour and a half. The zinc dust was first tried as a precipitant, but the shavings were found more satisfactory. Fuel being something of an item, a good 12x36 Corliss engine was installed and easily runs the mill with but little fuel and care. Two 16-foot economic boilers are set up, one only being used at a time. Water is supplied by a gasoline engine pump and gives a sufficient amount for sluicing out the tanks, thus saving time and labor. Zinc shavings are cut by the night engineer from the usual disc lathe. Electric lights are used throughout.

The entire plant cost less than \$35,000. In a ten months' run with R. F. Plintermann as chemist and mill superintendent, enough bullion was turned over to John Gray, the general manager, to more than pay for the mill, together with the mining and milling costs.

It was then found that some 12 feet of the underlying straight quartzite running from \$3 to \$5 could be treated at a profit. C. C. Griggs succeeded Mr. Plintermann as superintendent, the latter resigning. The mill was enlarged, a No. 3 Gates crusher replacing the No. 2 and a 100-ton leaching tank added and the mill pushed to its full capacity. During the summer nothing but straight hard quartzite was treated. The mill tonnage averaged 105 tons per day of twenty-four hours with two men as engineers, two tank men, two roll men, two on solution and one crusher man.

The ore is leached first with a five-pound solution, then weaker ones. It is but three days from the time the ore is conveyed to the tank until it is sluiced out, and in that time is leached from about a \$4 head to 80 cents to \$1 tails.

This quartzite ore is harder on crushing machinery than most hard ores. It is found necessary to put in new crusher concaves every month or six weeks. The first roll tires wear out in four months, while the second ones last but sixty days. This makes quite a repair bill, but the tire changes and repairs are readily made without cutting down the average capacity, and with the tonnage put through it is at a reasonable cost per ton for that ore.

The clean-up is made the 1st and 15th of each month and is looked after personally by Supt. Griggs. The first one in October was witnessed by the writer; and as I believe it to be a record breaker, I will give the results that I saw there.

The precipitation is carried out in two rows of five barrels each, which are pretty well loaded with "slimes" at the end of two weeks. These slimes, together with the short zinc, is all washed through a coarse screen into the clean-up tank and the washed zinc returned to the precipitation barrels as usual. After the "product" has settled the wash solution is pumped through a filter press, thus catching all suspended values. The clean-up was then transferred to a large lead-lined acid tank and given a thorough sulphuric acid treatment followed by steam and water, after which the entire contents of tank were pumped into a filter press with absolutely no loss. Then the rest of the sulphate was washed out with a large amount of hot water and air passed through the press to dry it more. The press contents, together with the filter cloths, were placed in a roasting pan and given a red heat for two hours, after which there were 49½ pounds of roasted product. This was melted down with an equal amount of a heavy borax flux and gave 623 troy ounces of bullion, 957 fine in gold and silver. Thus the refined precipitates ran nearly 85% fine bullion. The resulting slag weighed but thirty-two pounds and was fairly clean, assaying 12 cents a pound. The clean-ups are very satisfactory and check close to the mill assays on heads and tails. The amount of zinc used

is eight-tenths pound per ounce of bullion recovered. Seven pounds of lime are used per ton of ore and six-tenths of a pound of cyanide is lost.

The mine, more properly called a quarry, is a large cut. From 3 to 12 feet stripping is taken off as waste. Then there is a 15-foot bed of quartzite that is broken down at the rate of over 100 tons a day by two miners. Common labor does the rest. The cost of mining is probably less than any place in the Hills, and the milling is correspondingly cheap.

The company has recently been reorganized under the same management and additional ground been taken in that contains shale ores of higher value; and as the low-grade quartzite alone paid a fair profit, it makes one of the best cyaniding propositions of its class.

On inquiry at the company's office in Deadwood, W. L. McLaughlin, secretary of the company, kindly gave me the following figures on the cost of milling for the month of October, being about the average:

COST PER TON OF ORE MILLED.

| | |
|---------------------------------------------------|---------|
| Labor, including teamster, carpenter and assayer. | \$0 411 |
| Cyanide | 0 188 |
| Zinc | 0 031 |
| Light and fuel, including water supply expense... | 0 116 |
| Repairs | 0 086 |

Total cost per ton.....\$0 832

These figures bear commendable mention, and, considering the tonnage and character of ore treated, will compare very favorably with the best mills in older cyaniding districts.

Deadwood, S. D., Nov. 22.

Platinum.

Platinum is a gray-white metal, having a specific gravity, when pure, of 21.5, being heavier than pure gold, which is 19.3; but in nature, with the impurities, they are about the same. Platinum, like gold, is soluble only in aqua regia (a mixture of four parts of hydrochloric acid to one of nitric acid), although it differs from gold in this respect, that it dissolves in nitric acid when mixed with six times its weight of silver. Its great value rests on its infusibility at a heat that melts other metals; that, with its qualities of not being attacked by acids, malleability, etc., places it in a realm of non-competition. The value is to-day \$20 per ounce. The value varies with the demand and supply. Should a new use be found for platinum which would increase the consumption, as did the incandescent light, the price would jump up, or should the output decrease the result would be the same. It was first found in some of the placers of South America, mixed with the gold. It is now found in small quantities in many parts of the world.

Until recently all of the platinum produced was from the placers. Platinum ore, platinum in the ledge, was not considered to exist. Ore was not tested for platinum. A Sudbury, Canada, company, in testing their ore, found a little platinum. Since then platinum in the ore has been reported in other parts of this continent, but it is in very small quantity, and cuts no figure as yet in the world's production.

Recently Dr. David T. Day of the U. S. Geological Survey reported that in the Poston gold quartz mine, near Harrison gulch, Shasta county, Cal., kidneys of ore are being found, bearing a gray-looking mineral which he declares to contain platinum.

About 90% of the world's yield of platinum is obtained from the mines in the Ural mountains, Russia, and has been for years.

Brazil stands first among the small producers; United States of Columbia and Venezuela produce an appreciable amount; platinum is found in nearly all of the gold placers in South America. In North America it is not as common—the Pacific coast is its home, but its occurrence is spotted, northern California and the Frazer river, B. C., being the most productive. Australia adds a little to the world's supply.

A placer miner is liable to find it in his sluiceway wherever he works, and in all cases should separate and save it—so many throw it away. It can be sold in the United States—the principal refiners and manufacturers are Baker & Co., Newark, N. J.

Platinum is never found pure, having a small amount of a great many metals, as is shown by analysis:

| | |
|-----------------|-------|
| Platinum | 85.10 |
| Gold | .80 |
| Iron | 6.75 |
| Iridium | 1.05 |
| Rhodium | 1.00 |
| Palladium | .60 |
| Copper | 1.40 |
| Osmium | 1.10 |
| Sand | 2.20 |

Total.....100.00

Refining platinum is more difficult than the other metals. The crude metal is dissolved in aqua regia, taking about ten to fifteen times the weight of acid that there is metal, depending upon size of pieces. When dissolved the acid is mostly evaporated, ammonia added, and the solution evaporated to one-

twelfth of its original volume and allowed to cool; the iridium crystallizes out as the double chloride—which is a dark purple powder—filters off. Ammonia chloride is added, and the evaporation is renewed with a temperature nearly 10°, until the platinum-ammonium chloride separates; the solution is diluted with alcohol and filtered; the platinum salt is placed in a crucible and heated, to drive off the ammonium salt, leaving the black platinum. Care is taken not to heat hot enough to agglutinate the platinum, as it interferes with the subsequent working. The platinum is all put through a sieve and then hammered into an ingot in a mold. Some articles are cast, some are rolled, but the first quality are hammered—it imparts a different quality to the metal. For use in the laboratory the hammered crucible or dish will last longer and give better satisfaction than the rolled; it has no crystalline structure, which the rolled is so apt to assume after being used. The most extensive use to-day for the metal is in the incandescent light—it connects the copper wire with the carbon. Besides this, it is manufactured into wire and apparatus for physical, chemical and almost all scientific uses.

Mohave County, Arizona.

[STAFF CORRESPONDENCE.]

In discussing the merits of Mohave county from the mining standpoint, it has been customary for many persons to start with the premise that this section is rich in minerals, but that operations are handicapped by the absence or extreme scarcity of water and fuel. This is an idea that deserves a little explanation, for it clings to the public mind as a popular supposition that does not quite accord with present conditions. It is true that there is a very slight surface flow of water in any of the stream beds except as the result of "cloudbursts" and heavy rains, which often occur. In fact, this entire section is typically arid, so far as surface moisture is concerned. But the expenditure of a little money in sinking and drifting to develop a water supply has usually met with success, which shows the existence of a stratum of water at a common level in each particular locality. At Kingman the Santa Fe Pacific R. Co. gets an abundant supply at 120 feet depth, there being some twenty to thirty other wells in this town, ranging from 100 to 180 feet deep, from which the water supply is ample. The railroad company has been successful also in obtaining good wells at other stations along its line in this section. At the town of Chloride, situate 25 miles north of Kingman, at the foot of the Cerbat range and on the edge of the arid Sacramento valley, there are a number of wells, from 75 to 120 feet depth, which supply all the water that is required. The chain of mines along the foot of the range near Chloride furnish their own water for steam and mill use. The Elkhart, Schuylkill, Tennessee and Minnesota-Connor are the ones specially referred to. It is possible the supply may not be ample in all of them; but it is shown that the supply is to be had, even though it might cost something to secure it. In these mines the water level has been struck at 100 to 300 feet depth. The Philadelphia-Arizona Co., owners of the Minnesota-Connor group, have found an abundant supply of water by sinking a well at a point 2700 feet from the mine. The water will be pumped from the well and carried by gravity to a cemented reservoir just above their new mill. This is aimed to supplement the supply that comes from the mine.

At Mineral Park several wells with windmill pumps demonstrate a similar condition existing in that historic mountain basin, whose mines yielded high-grade silver chlorides through the '70s. Here a unique and, no doubt, a thoroughly practical, water system has been established by the Aztec Turquoise Co. of New York, under the local management of James W. Haas. It consists of two cisterns, holding about 800 barrels each, blasted out of the solid rock on the steep mountain side, to catch the rain and melting snow that fall upon the area above them. Lateral ditches have been cut in the rocks from the cisterns, so as to drain a larger area. Each cistern is shielded by a hanging roof of rock, the water being first caught in a surface sump which drains through a screen into the cistern. The cisterns are provided with pumps and siphons, attaching to an 1800-foot pipe line by which the water is conveyed to the boarding house and office at a point 800 feet lower. Mr. Haas, who has been a resident of Mineral Park twenty-seven years, thinks the precipitation is sufficient every season to catch by this method all the water that his company will require.

Coming to the C. O. D. mine, situated on the Walapai valley side of the Cerbat range, I find the mine, with 400-foot shaft, supplying the necessary water for steam use, ore concentration and general purposes. It is stated the mine produces about 8000 gallons per day, the mill water being used over and over again, as the supply requires its economical use.

In the Gold Road district, in the River range, but also in Mohave county, sinking in various shafts has developed a strong flow of water at 160 to 180 feet

*See illustration on front page.

depth. At the Berkeley mine, 25 miles south of Kingman, a large volume of water has been pumped from the 112-foot shaft. Similar supplies have been obtained at Cerbat, Oro Plata and elsewhere. What is here written perhaps shows that the water problem here must always be considered in connection with operating expenses, but that it is one that can usually be solved with no great outlay.

As to the fuel question, Mohave county has no coal mines, neither has she more than a scanty growth of scrubby timber, but within the last year or two the fuel oils from southern California's petroleum wells have been adopted throughout this section. Every mine and mill I visited in the Cerbat range has a steam plant provided with oil burners; and the general expression among the operators is that the use of fuel oil is satisfactory and comparatively economical. At present about ten carloads of crude oil a month are shipped to Kingman and Chloride, and about twelve tanks a month of distillate. These quantities are sure to be increased from now on. The manager of the C. O. D. mine and mill, having two 50 H. P. boilers, states that it costs eight-tenths of a cent per H. P. hour for fuel oil.

The Aztec Turquoise Co., in the Cerbat range, near Mineral Park, is a New York company, of which J. G. Doty is general manager. Its holdings comprise eleven claims on Turquoise and Ithica hills, covering a portion of a turquoise belt trending southwest and northeast. Most of the shipments thus far have been from the Aztec mine, on Turquoise hill, where some \$27,000 have been expended in development and equipment. Later work has been confined to the claims on Ithica hill, where the novel water system has been put in which has already been referred to in this. A force of twenty-five men are at present employed by the local manager, James W. Haas, who was instrumental in getting this company to take hold of these properties and develop them. The turquoise is found here in small seams and pockets in the porphyry and quartz, portions of which are considered of excellent quality. It is a character of mining that requires the handling of a large tonnage of material to secure the small quantity of the turquoise gems that are marketable.

Mineral Park basin was the scene of active mining operations from 1870 to 1880, within which period a considerable tonnage of high-grade silver chloride ore was mined and shipped; some efforts were made to mill the silver and gold ores which began to merge into the sulphide stratum. At that time the Keystone mine was one of the principal producers, the company owning it erecting a mill. Its shaft was sunk to a depth of 265 feet, at the dump of which there is a large tonnage of ore. James Uncapher, as one of the owners, has charge of the Keystone at present.

The Woodchopper's Relief mine, belonging to J. W. Haas, is being developed by a crosscut tunnel that will open the ledge of ore some 200 feet below the old workings. At the outcrop and below is a showing of silver-lead ore. The Buckeye, Lone Star, Katie, Estella, Ladybug and Ithica are among the groups that are familiar to old-timers of this camp. The earliest mining here was in 1865. In the '70s Mineral Park was the county seat of Mohave, and an important stage station on the route from San Bernardino, Cal., via Hardyville, to Prescott, Ariz., and Santa Fe, N. M.

WASCOTT.

Mineral Park, Nov. 30.

GOVERNOR BRADY of Alaska says in his annual report that, "from the appropriation of \$325,000 for public surveys, the sum of \$5000 was set aside to commence surveys in the district of Alaska, under the direction of the Commissioner of the General Land Office. Bids were invited for the commencement of this work, but owing to the high rates of transportation between the settlements of Alaska, the price of labor and the length of time required before payment for their services could be received, the deputy surveyors stated that they could not undertake the work, even at the maximum rate fixed by Congress. To remedy this condition of affairs, the Governor recommends the repeal of Section 1 of the Act of May 14, 1898, and urges that the general land laws of the United States be extended to Alaska, so that settlers coming into the country may find laws similar to those enacted for other parts of the Union. He also recommends an appropriation of \$200,000 for public surveys in Alaska, to be expended within the discretion and under the direction of the Secretary of the Interior.

A METHOD of quickly preparing wood for building and manufacturing purposes by electricity is being tried in Austria. The green wood is placed in a large wooden trough, whose bottom is covered with a lead plate, which is connected with the positive pole of an electric battery. A second lead plate covers the wood to be dried, thus forming the negative pole. The wood is then subjected to a bath in a solution composed of 10% resin and 75% soda, and under the influence of the electric current the sap is drawn out of the wood and rises to the surface, the solution being absorbed by the wood. In about two weeks' time after this the wood is dry and ready for use, or the drying can be done by artificial means in a much shorter time. The actual operation in the trough, however, only occupies from five to eight hours.

Mining and Metallurgical Patents.

Patents Issued November 26, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

WATER MOTOR.—No. 687,074; B. E. Shepler, Clarksburg, W. Va.

A casing having major end and minor end, a wheel rotatably disposed in each end of casing, the wheel in minor end being fitted close to casing and wheel at major end of casing being spaced downwardly from upper side thereof and close to end thereof, transverse diaphragms in casing disposed above and below plane of axes of wheels, an inlet opening through major end of casing and extending above and below uppermost portion of adjacent wheel and an outlet below wheel in major end of casing.

PLACER MINING MACHINE.—No. 687,387; S. M. Walcher, Kansas City, Kans.

A cylindrical tube rotatable about its longitudinal axis, a longitudinal groove formed in tube nearly from end to end, a vertical frame or tower by which tube is guided, a vertical rotatable shaft supported by the frame, a driving gear wheel keyed to shaft, an extended base of frame having an opening concentric with tube, a sleeve embracing tube above opening, a dog or catch carried by sleeve, a driven gear wheel having sleeve as a hub, and engaging gear wheel on vertical shaft, rollers interposed between extended base and driven gear, rollers entering a groove in gear and thereby holding it in mesh with driving gear.

SELF FASTENING SHAFT KEY.—No. 687,392; M. P. Boss, San Francisco, Cal.

A shaft provided with a plane faced key seat therein, and a hub having a bore for shaft and a simple counterbore extending from end to end, of a plano convex key conforming to key seat in shaft and to counterbore.

MAGNETIC SEPARATOR.—No. 687,579; F. A. M. Schiechel, Frankfurt-on-the-Main, Germany.

The combination of a pair of magnets having tapered pole pieces, one of the magnets being posi-

tioned horizontally, and the other arranged edge-wise in a vertical plane below and to one side of first mentioned magnet with an intervening space between edges of the pole pieces, an endless carrier traveling around pole piece of horizontal magnet and adapted to deliver material to be treated over and beyond edge of pole piece of vertical magnet; and means for adjusting width of space intervening between edges of pole pieces.

TURBINE.—No. 687,269; A. E. A. Riegel, Pantin, near Paris, France.

A turbine wheel having around its periphery a series of pallets arranged in step form and each consisting of two segments of cylinders intersecting each other in median plane of turbine wheel in form of an acute aris, a shaft forming axis of turbine wheel and extending equal distances on both sides, pinions carried by shaft one on each side of turbine, gears adapted to be engaged by pinions, oppositely disposed inlet nozzles a a' which co-operate with turbine wheel, a valve casing, a plurality of delivery ports in communication with valve casing and a single hand-operated valve for controlling delivery ports, whereby ports may be brought simultaneously into communication with either inlet nozzle and turbine rotated in either direction.

METHOD OF RECOVERING CYANIDES.—No. 687,258; W. Orr, Salt Lake City, Utah.

Recovering cyanide of potassium or sodium from "weak" cyanide solutions and from "fouled cyanide mill solutions" by adding to the solutions sufficient soluble salt of zinc to precipitate cyanide as single cyanide of zinc, next separating and withdrawing precipitated zinc cyanide from solution, next applying to precipitate a solution of alkaline hydrate, next adding to resulting solution a soluble alkaline sulphide, and finally removing precipitated zinc sulphide from last mentioned solution containing desired cyanide of sodium and potassium.

In the reconstruction of a portion of a large office building in Chicago an obstruction was met in the form of six heavy I-beams of 15 inches depth which it became necessary to remove. After a consultation with iron workers it was estimated that the work of cutting the beams in two with hack saws would require the labor of two men working about twelve days, and that special saws would have to be constructed owing to the difficulty of getting access to the beams. Fortunately it ran through the mind of somebody that the tools employed by burglars in opening safe or vault doors by electricity might be employed in this case, and accordingly the experiment was tried with highly satisfactory results. Use was made of a commercial lighting circuit in the vicinity and the beams were burned in two with an electric arc in twelve hours' actual working time. The method employed consisted in simply grounding the positive terminal of the circuit to the iron framework of the building and attaching the negative side to a carbon point of 1½ inches diameter, for contact with the beam. No skilled labor was required, the energy expended was only about 5 H. P. and the expense was slight. The job would have cost about \$100 if it had been done by the ordinary method of iron workers.

NAPHTHA RESIDUE has been used in the manufacture of iron and steel for several years in Russia. This "mazout," as it is called, is a brownish black liquid remaining after the distillation of benzine and kerosene. As American petroleum produces 70% to 80% of kerosene, and the Russian petroleum only 33%, there is a much greater proportion of residue in the latter. Thus, on the average, 100 metric tons of Russian oil produce 3 tons of benzine, 35 tons of kerosene and 60 tons of mazout. This mazout contains 87% of carbon and 13% of hydrogen, and its

heating power is equal to 11,000 calories, while that of coal is only 8000 calories. The Russian engineers figure that for heating purposes $6\frac{1}{2}$ tons of mazout equal 11 tons of coal of good quality. Several methods are in use for burning this fluid, the best being a modification of the Koerting injector, through which the liquid is introduced under pressure into the fire-box, through pipes and reheaters.

Improved Laboratory Crusher.

The Simplex crusher, shown in sectional view in the illustrations, has produced a favorable impression with assayers who have used it for several years. It has recently been improved and some slight changes made in the construction; but in shape and method of crushing it remains the same. Primarily it was a small hand machine, intended solely for laboratory use; but, owing to the demand for a larger machine, it was decided to manufacture a larger size and arrange it for use with power. The small hand machine continues to be most in demand and the sales are constantly increasing. The manner of crushing is simple and effective. As illustrated, the motion is

imparted to the vibratory jaw by means of an eccentric on the shaft. The heel of this jaw rests in a brass box, and the motion of the lower portion is the arc of a circle, always expelling the crushed material. Adjustment is secured by means of two set screws that press on the brass box holding the heel of the vibratory jaw. This machine may be adjusted to crush from 2-inch to 10-mesh. With the smaller size the manufacturers say that it is possible to crush about 50 pounds an hour by hand and 75 pounds by power, and that the larger size will crush about 75 pounds an hour by hand and 125 pounds by power. They assert that in actual operation by successive gangs of "peons" over a ton of ore has been crushed from 2 inches to $\frac{1}{4}$ inch with the larger machine in a day's work.

The Simplex ore crusher has stood severe tests in various portions of the world, and is designed to satisfy all requirements for a laboratory crusher. The manufacturers are F. W. Braun & Co., Los Angeles, Cal.

Mine Superintendents.

Mine owners and others who realize the vital importance of having a capable superintendent are sometimes handicapped by the fact that they live at a distance and rarely have more than a superficial knowledge of the business. This makes it hard to select good superintendence or to judge the quality of what they do secure. To all business men profit or loss, success or failure, is the final and decisive test of ability. However reliable this test may be when applied to those responsible for an investment, it is certainly not decisive for the others who are

carrying out its details. An attorney who has to handle a bad case may display such ability as to arouse the admiration of other lawyers. Unless he wins the case, however, all this will probably be lost on his client. To a mine owner likewise, profit or loss is generally the measure of his superintendent's ability. This individual is apt to have a bad case to start with. In many cases the chances are against success and the investment should never have been made. Even paying mines are sometimes bought at an enormous overvaluation. It is a hopeless task to recover the capital, to say nothing of any net profit afterwards. But whether the mine is good or bad, and whether the superintendent is able or otherwise, he understands one thing clearly. His employers will not ordinarily recognize any skill and economy he may show, and he will be judged only by results. While this is an incentive to make the mine pay, it is hardly calculated to draw out his best powers. However skill may improve the chances, finding pay ore is largely a matter of fortune. This element of chance may disappoint the best planned work. He will get no credit for the latter. Whatever the cause the odium of failure will be the same. Why, then, should he strain himself or do anything to shorten his position? If the mine is already paying, there is still less reason for efforts which will not be appreciated. All that is necessary is to take it easy and let his reputation grow with the dividends.

A peculiar feature of this mining business is the wide range of ability among men who occupy high positions. In ordinary lines of manufactures or commerce competition is close and keen. This and the constant interchange of information as to the best methods keeps every manager, superintendent and foreman close up to an average standard. This is not true in mining. In addition to the peculiarities previously mentioned, business competition does not exist. In mines no two are alike. Moreover, they are more or less isolated. Superintendents and foremen are not subject to close competition and criticism and comparison of their work with that of others. Hence men found in charge of large mining operations vary strangely from those who have the highest qualities of skill and judgment to others who have none. The industry as a whole, and particularly the large communities dependent upon it, sometimes suffer from errors of all kinds. Only those who have occasion to visit and compare mine operations in all quarters can realize how frequently mistakes recur.

Robins Belt Conveyors in Stamp Mill.

The Homestake Mining Co. at Lead, South Dakota, have installed three Robins belt conveyors, each 167 feet long, at their De Smet shaft-house. The belts receive the ore through chutes in the bottom of the bins, the leading points being close together. The conveyors then diverge from this center and deliver the ore into the 100-stamp mill. The accompanying illustrations show the conveyors themselves and the three bridges which support them. Each belt carries about 160 tons in twenty-four hours. They run at moderate speed and are driven from a single shaft at the discharge end, requiring about 3 H. P. each. While the ore is in transit on the belts, it is sorted, and small pieces of wood and chips are picked out from it. These come from broken timbers in the mine, and formerly greatly obstructed the discharge from the screens. By keeping them out from the mortars from ten to twenty tons more per day are now crushed. The three belts are fired by one boy. Further information may be obtained from the Robins Conveying Belt Co., 15-21 Park Row, New York.

Novel Dam Building.

At Dobbins, in Yuba county, Cal., the Bay Counties Power Co. is building an immense dam to create a storage reservoir to be used in connection with its North Yuba electric plant. The dam, which is an earth fill, will, when completed, be 1400 feet long on top, 97 feet high, with a base over 400 feet thick. The face of the dam will be built up with scrapers, the balance of the material being hydraulicked into position. The water for this purpose is obtained from the stream in which the dam is being built, and is taken out of the stream below the dam. Two centrifugal pumps, operated by electric power from the company's plant at Colgate, on the North Yuba, $2\frac{1}{2}$ miles distant, force the water through a 15-inch pipe and apply it to the bank 100 feet above with a pressure equivalent to 250 feet head. Three hundred miners' inches of water is used,

and as the stream flows only about 5 inches of water, it is necessary to store the water and use it over and over again. The site of the dam is lighted by electricity, enabling the work to be carried on night and day.

Philippine Miners' Memorial to Congress.

The American Mining Association of the Philippine Islands has sent the following memorial to Congress relative to mining laws for the islands:

WHEREAS, The conditions now existing in the Philippine Islands relative to mining are such as to practically prohibit the development of mines, and will so continue unless the United States mining laws are extended to this Archipelago; and

Whereas, Many American miners have been prospecting for the past two years, and have located claims under the United States mining laws, and organized mining districts, similar to those that have been organized in the mining States and Territories of the Union, many of whom have done considerable development work on their said claims, the said prospectors and miners continuing to locate mining claims, expecting the Congress of the United States to extend the United States mining laws to these islands, and that their claims now located will be recognized by the Congress of the United States; and

Whereas, It is a well known fact that the Spanish mining laws in the Philippine Islands have been practically a failure, as far as the development of the mineral resources of the said islands is concerned, there having been practically no prospecting done until the American miners, who are here, and who are the pioneers in prospecting and mining, have gone over these islands and discovered valuable mineral deposits; and

Whereas, The United States mining laws, as is well known, have been the cause of developing the great mineral resources of said country, and the same rule will apply here, provided that Congress shall extend said mining laws to this Archipelago; and

Whereas, The prospectors and miners now in these islands, numbering somewhere between 1500 and 2000, most of whom are ex-soldiers, are now out in the hills and mountains prospecting and developing their said claims, with the expectation that Congress will recognize their said locations and extend the United States mining laws to these islands, and thus develop the great mining resources, which will not be developed unless the United States liberal mining laws are extended here; now, therefore, be it

Resolved, That we, the American prospectors and miners, now in session in the city of Manila, do hereby resolve and petition the Congress of the United States to pass an Act extending the liberal mining laws of the United States to the Philippine Islands and to recognize their claims now located, and that the Civil Governor and the Philippine Commission be requested to embody a copy of these resolutions in their report to Congress, and that the Philippine Commission recommend to Congress that the United States mining laws be extended to said islands, and that a copy of these resolutions be sent to the Civil Governor of the Philippine Islands, to the Philippine Commission, to the President of the United States, to the Secretary of the Interior, to the Congress of the United States and to such individual members of Congress as may be reached by mail.

[Signed.]

J. B. EARLY, President.

ROBERT MILLS, Secretary.

—Manila, P. I., Oct. 13, 1901.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

The Treadwell mill, it is reported, is to be operated by electric power from the Sheep creek water power. A large generating plant is projected on that stream, the electric power to be conducted across Gastineaux channel by cable, a distance of 4 miles, to the Treadwell plant. The Treadwell Co. operates 1000 stamps, partly by steam, and with the substitution of electric power from water the cost of milling ore will be reduced.

ARIZONA.

COCHISE COUNTY.

(Special Correspondence).—The Copper Glance M. Co. have their two-compartment shaft down 110 feet, and shaft No. 2, a single compartment, 4x6 feet in the clear, is down 45 feet. The company at present employs sixteen men. The property is 7 miles southeast of Bisbee on the new El Paso & Southwestern Railroad, which recently established a station at this point that is named Glance. C. L. Beckwith is manager and C. C. Warner of the Copper Queen Con. M. Co. is Supt.

Bisbee, Nov. 30.

At Pearce the Commonwealth mill is running at full capacity.

GILA COUNTY.

The Grey mine, at Globe, is one of the principal claims of the United Globe Mines Co., in which Phelps, Dodge & Co. of New York are principal owners. Supt. N. S. Berray commenced sinking a three-compartment shaft on it on Feb. 20. The work has now reached the ninth level at 650 feet and will be continued to the tenth level at 775 feet. It is expected to make this within a year, or by Feb. 20, 1902.

MOHAVE COUNTY.

(Special Correspondence).—The C. O. D. mine is situated on the Wallapai valley side of the Cerbat range. It has been worked periodically for many years, and is credited with a production of nearly a million dollars. Within the last year the property was acquired by the C. O. D. Mines Co., of which Henry S. MacKay is manager. The vein cuts through a granite formation in an easterly and westerly course, and has a dip northward. It is approximately 26 feet between the walls, there being a shoot of ore 4 to 10 feet in width in a quartz gangue. This shoot is well opened at the 300 level. The ore is composed of an iron and lead sulphide, carrying gold, silver and lead values, and seems well suited to concentration. Some shipments of sorted ore ran 55% lead. The company has erected a concentrating mill of forty tons daily capacity, provided with crusher, trommels, high-speed rolls and Bartlett tables. It is stated that the mill will be enlarged and a shaft house and sorting room built. About one-tenth of the output will be shipped crude and nine-tenths milled. A considerable tonnage is piled up on the dump.

The same company has acquired the Prince George mine at Stockton Hill and the Golden Gem at Cerbat. On the former a shaft is being sunk to further open an ore shoot. On the latter work is in progress where there is said to be ore running 10 ounces gold and 100 ounces silver to the ton.

Kingman, Nov. 28.

J. W. Roberts has bonded the Night-hawk mine from G. M. Bowers and the Omega mine from F. S. Dennis and P. Caffery of Kingman. The mines are at Layne Springs. The Nighthawk is opened by several tunnels, the lower of which is now in over 1400 feet on the ledge. Mr. Roberts is representing Los Angeles, Cal., people.

W. F. Grounds, owner of the Clay Springs group of mines near Kingman, says the tunnel on the vein is now in 200 feet and is still in the ore shoot struck 100 feet back, with a back of gold ore overhead of 150 feet. As soon as he has the vein more fully developed, he says it is his intention to put in a mill.

The Leonora mill, at Hardyville, has been started up on a trial run. The ore runs about \$35 per ton and the mill is said to be saving a high percentage of the values. It is the intention of the company to repair the hoisting plant at the mine and start up work. The mill, it is believed, will handle the ores down to the water level. When below water, where sulphide ore is expected, a concentrator is to be added to the mill.

Denver, Colo., Salt Lake, Utah, and Los Angeles, Cal., people, headed by O. P. Posey, C. K. McCornick and W. Bayly, have bought the Gold Roads mine from J. Burkhardt and B. Erickbrecher of Los Angeles for, it is reported, \$500,000. The property comprises six claims 25 miles

north of Kingman and about 9 miles from the Colorado river. The vein averages 14 feet in width, carries an average value of \$20 gold per ton, and has been opened to a depth of 200 feet. The buyers propose to immediately equip the property with a mill plant.

SANTA CRUZ COUNTY.

The Pena Blanca mine, at Nogales, J. S. Hurst manager, has been a steady producer of lead-silver ores for the past three years. The company at present operating the mine recently bought it. They contemplate the erection of a 25-ton smelter about Jan. 1. The ore, it is claimed, runs 62% lead, fourteen ounces silver and \$4 gold.

YAVAPAI COUNTY.

The Monarch G. & C. M. Co. is opening up new bodies of ore on their mine near Jerome.

Supt. Wombacher says assays from average samples of the ore body in the El Capitan gave returns of over \$200 a ton, the shoot averaging 18 inches in thickness for 75 feet. The site for the new mill is graded and ready for construction.

E. D. Treadwell is superintending the sinking of a shaft on the Iron Queen mine near Prescott. The mine has been worked several years for iron ore, which was used for flux at the Big Bug smelter. At a depth of 150 feet a small body of native copper ore was struck and Mr. Treadwell is now developing it as a copper mine.

CALIFORNIA.

ALPINE COUNTY.

Supt. Curtz of the Loope mines, near Monitor, has shipped fifteen tons of concentrates to the Selby Smelting Works. There are about forty men employed at the mines. Mr. Curtz expects to build a smelter and put in electric power to operate the mill next spring.

AMADOR COUNTY.

(Special Correspondence).—The Plymouth Rock G. M. Co., J. H. Durst manager, is running a tunnel, putting up a hoist and erecting office buildings, etc. The property consists of eighty acres patented land 3 miles north of here.

Plymouth, Dec. 3.

CALAVERAS COUNTY.

The Pence ditch has been completed and is now ready for the turning in of the water. Active work has been commenced on the gravel deposits at Round Butte, near San Andreas. The camps have been removed to the Treat ditch, which will be cleaned out to carry water to the Johnston gravel mines.

EL DORADO COUNTY.

The California Slate Manufacturing Co., capital \$100,000, with works at Placerville and office San Francisco, has been incorporated. The directors are F. S. Chadbourne, H. F. Ingersol, F. S. Ingersol, M. Glaser and H. S. Martinez.

FRESNO COUNTY.

(Special Correspondence).—Maj. Fred A. Clark of San Francisco has been looking over the hydraulic work of the Fresno Placer M. Co., Sycamore creek, Kings river. The ground had been worked in a crude way for many years, but the company is putting in an improved plant and is now placing eighty tons machinery for hydraulic elevators, and is building a ditch from Big creek, a distance of 5 miles, to give 300 feet head. Much of the gold is found in nuggets and is of remarkable purity, being worth \$19.50 per ounce.

Kings River, Dec. 1.

INYO COUNTY.

G. McConnell, J. J. Gunn, W. T. Grant and A. F. Mairs have bonded their group of mining claims, situated in the Ubehebe district, to W. O. Crosby of Boston, Mass., for \$125,000. Ten per cent is to be paid on or before Dec. 31st, balance to be paid on or before twelve months.

W. Moore has bonded a claim at Darwin for \$3500—\$500 cash down.

N. Breedin of Bakersfield has a bond on a claim near Tibbitts, belonging to G. D. Calvert, C. Walter and D. P. Hargis, at \$15,000.

The bond of W. T. Stevenson on the Flagstaff mine, at Swansea, owned by F. Meyers, has been assigned to J. E. Lutz of Oakland.

NEVADA COUNTY.

At the Home mine, near Grass Valley, ten additional stamps added to the 20-stamp mill have been started. The ledge varies from 8 to 25 feet in width. The pay shoot is said to be extensive. About thirty men are employed under Supt. D. J. McFall.

Arrangements are being made for starting up the National mine, near Graniteville. The mine is owned by Mrs. McKilligan and others and has been bonded to a company represented by J. H. English of Nevada City. In former years the National was a good producer.

G. A. Nihel has completed the erection of the 10-stamp mill on the mine at

Meadow lake, operated by Capt. Ord and others. He is now building a covering over a tramway from the mine. Besides the mill, a small smelting plant has been built, which, it is expected, will reduce the ore that can not be worked in the mill.

PLACER COUNTY.

The Rawhide quartz mining company has commenced installing a new 10-stamp mill at its mine on Texas hill, near Blue Canyon.

The dam on the north fork of the North Fork and 2500 feet of ditch have been completed and work on the flume is in progress. The 3-stamp mill at the mine is running steadily. The ore is taken from the mountain side by means of an aerial ropeway with self-dumping buckets. The quartz at present runs from \$7 to \$10 per ton from a large ledge. The new mill will have a capacity of thirty tons in twenty-four hours and will be supplied with four concentrators.

SACRAMENTO COUNTY.

Construction of the dredger at Teat's Flat, near Folsom, has been delayed by the difficulty in obtaining the lumber from Oregon. W. R. Bean of the Risdon Iron Works of San Francisco is superintending the construction.

A contract has been let by the Colorado Pacific G. D. Co. for the construction of another dredger at Mississippi Bar at Folsom.

The Natoma Co. has agreed to sell to R. G. Handford of San Francisco 260 acres of dredging ground near Folsom at \$225 per acre.

Preparations are being made to run wires from Folsom to Mississippi Bar to furnish electrical power to operate the dredger now there, and also the one that is to be built there.

F. and Jennie A. Cox and C. W. and P. Clarke have sold to the Colorado Pacific G. D. Co. 100.85 acres in Mississippi Bar, giving the company control of the entire acreage of the bar.

The prospecting drill which the Ashburton M. Co. has had in operation at Wheatland for several months has been brought back to Folsom.

SHASTA COUNTY.

The electric power plant of the Keswick Electric Power Co. on Mill Seat creek, 29 miles southeast of Redding, has been started into operation. The company is furnishing light and power to Redding and is to furnish light and power for the smelting plant of the Mountain Copper Co. at Keswick, distant 34 miles, and for its Iron Mountain mine, distant 48 miles. The Keswick Electric Power Co. is composed principally of San Francisco people, H. H. Noble being the president and H. L. Shannon general manager. Among other improved devices in the power plant are static interrupters, which provide safety to wires and plant in an electrical storm. There are also six automatic gates in the pipe line, which are a new thing. They act as safety valves, opening and discharging water from the line when the pressure reaches a certain excess. In addition to furnishing light and power to the copper mining and smelting plant of the Mountain Copper Co. and to Redding, the company will light the town of Keswick, and in the spring a 27-mile line will be run to Red Bluff and to the Maywood colony at Corning and the Stanford ranch at Vina.

The Mountain King and Mountain Queen quartz mines, on Soda creek, near Dunsmuir, are being developed by P. F. Furlong and T. S. Kaney. The Mountain King has been opened by tunnel in 460 feet and shows a 4-foot ledge which is claimed to average \$25 a ton. The Mountain Queen tunnel is in 60 feet and shows decomposed free-milling rock. Lumber and all material are on the millsite for the building of quarters for the miners and an arrastra. It is proposed to get out ore which will be packed down to the arrastra for working.

A Mr. Mitchell, representing Salt Lake City, Utah, people, has bonded the Oak group of claims, near Copper City, from R. E. Collins, S. Stewart, W. Blagrove and W. Ellis, who have been doing development work on them. The bond is for one year at \$15,000, a payment being made down. Mr. Mitchell has arranged to continue and extend the development.

SIERRA COUNTY.

The owners of the Dudley gravel mine at Forest have incorporated as the Corotoman M. Co., with office in Los Angeles, and capital \$200,000. The directors are M. C. Green and Helen H. Green of San Diego, Cal., and W. R. Green, H. A. Green and E. B. Spencer of Los Angeles, Cal.

The Harpington G. M. Co. has been incorporated to operate the Tempest and Capital mines, near Camptonville, with office in San Francisco. The capital is \$75,000, and directors are W. E. Rowlands, H. M. Owens, H. Jones, F. J. Hennessy and T. C. West, of San Francisco.

SISKIYOU COUNTY.

(Special Correspondence).—The mill of the Yreka M. & M. Co. at Rollin (in the Salmon river country), was started up on the 23d ult. It is expected to crush 10,000 tons of ore from the Mountain Laurel mine this water season. Last year's season 6000 tons crushed netted a little over \$10 a ton. The pumps, hoist and power drills at the mine are operated by compressed air, using sixty pounds pressure. The company will put in a suspended cable tram next spring to transport ore from the upper claims—the Ohio, Flora Blanche and Aida—to the mill.

Rollin, Dec. 1.

H. Mattern of the Wabana Co., at Henley, is having a 100-ton test made at the Badger State mill, from their new find on Rocky gulch. They claim to have 1000 tons of ore blocked out, with 6 feet of good ore in the face of the tunnel. A wagon road will be constructed from the mine to their mill site, on Klamath river, where a 10-stamp mill will be erected, run by water power.

The Golden Eagle Co., G. Rymal Supt., has 6 feet of \$15 rock. This is a recent find, their present depth being about 100 feet.

Roberts & Jilson Co. have increased their force to thirty men. They have recovered the lost pay shoot, and propose to block out from now until March 1st, when the mill and mine will start up with a full force.

E. F. Olden of Colorado has bought the Chaney, Sutphan and Higgins mine and mill on Hungry creek for \$1600 cash.

San Francisco men, who recently bought some mining ground at Oro Fino, have cleared \$900 over all expenses in fourteen days on crushing rock from the claim. The ore body is about 75 feet wide, consisting of a mass of small quartz seams in a dike rock, all of which is taken out and milled.

TRINITY COUNTY.

The Chloride-Bailey mines at Dedrick are being equipped with a new mill. It has two 5-stamp batteries and a complete concentrating plant. The machinery will be set up at the mouth of the lowest level on the property, and at a point where the entire output of ore can be handled by gravity and the mill operated by water power. The mill now in use, having ten stamps, is situated well up on the mountain.

TUOLUMNE COUNTY.

The Tansy pocket mine at Sonora, operated under lease by Birney, Munroe & Launer, has recently produced some rich quartz. It is reported that 1050 pounds which was shipped contained \$25,000 in gold and that 148 pounds in another lot contained \$8400.

A trial crushing of ore from the Little Wonder mine, at Big Oak Flat, Mr. Roberts Supt., paid \$12 a ton. The owners are considering the putting up of a mill.

W. A. Nevills and wife are reported to have sold to W. H. Martin the New Albany quartz mine and a 10-stamp mill, also the north extension of the New Albany and the New Albany South quartz mines at Carters, and also the New Albany ditch.

The eighty acres of mining ground at Sonora, recently bonded by Doyle Bros. to San Francisco parties, covers a portion of Table mountain and contains a deep channel, the gravel of which is known to be rich. A shaft has been sunk on the property.

COLORADO.

BOULDER COUNTY.

Work has been commenced on the 100-stamp mill of the Boulder County Co., near Eldora. In doing the development work, Supt. Lake has taken out so much ore that the company has been forced to build their mill this winter, instead of next summer, as originally planned. The mill will be erected at the mouth of the tunnel, which will in about 4000 feet give a depth of about 1000 feet under the present workings.

CHAFFEE COUNTY.

The Little Annie mine, near Buena Vista, has been bonded by J. Kloes, who has been shipping ore from it for the past three months. There is a small mill on the mine which it is proposed to remodel and add machinery to so that the ore can be concentrated at the mine before shipment.

CLEAR CREEK COUNTY.

A strike has been made in the Kitty Owsley property in East Argentine, which is being developed under bond by Schauer & Noone. Sixteen inches of ore, assaying 73% lead, twenty-seven ounces silver and \$4 in gold, have been opened in a winze 15 feet below the main tunnel level.

The Newhouse tunnel, driven with but one shift of drill men at work in the heading, is expected to be advanced for the month of November 270 feet. The management is experimenting with a loading machine to remove the broke

rock and several tests have already been made. The machine is about 10x10 feet in size and 5 feet high. It requires four engines to operate it, air being used. It has been found necessary to put in stronger engines, but the shovel has otherwise proven a great success, so that it is believed to be now only a question of building the machine strong enough.

The new tunnel level on the Sporting Times, at East Argentine, has struck ore, a large amount of lead having made its appearance through the gangue and quartz. Manager Shroff believes he has struck the edge of the ore shoot.

FREMONT COUNTY.

The owners of the Isabella mine at Tac-lamur have installed a large hoisting engine on the mine. The property is owned by the Tremont Mines Co., of Boston people. The ore carries lead, copper, zinc and silver, and is uncovered to a depth of over 200 feet. The company, it is said, will probably build a concentrator at an early date.

GILPIN COUNTY.

Mrs. E. M. Baldwin of Chicago, Ill., has sold to the National Tunnel M. & M. Co. a two-sixths interest in the Illinois, Merimac and Lexington lode claims in Lake and Russell districts, near Central City, for \$10,000, and has also conveyed to the company a group of fourteen claims and a three-fourths interest in the Everett lode, all situated in Gregory, Lake and Russell districts, for \$75,750. The company has also bought from A. Oeschler and F. W. Stevens a one-third interest in the Illinois, Lexington and Merimac lodes. The company during the past year has been working a portion of the property through the Wabash and National tunnels from Black Hawk. The company is composed of Chicago people, with C. W. Baldwin as one of the principal stockholders. J. Brohl of Central City is the mine foreman at the National tunnel.

The Butler Con. M. Co. has been incorporated at Central City with G. W. Mabey, Jr., as president and R. Codman, Jr., secretary and treasurer, to operate the Butler property in Eureka district. The shaft building will be overhauled and another plant of machinery installed. The shaft is down 340 feet.

The Electric Spark G. M. Co. has been incorporated at Central City, capital \$200,000, by J. A. Yawger, O. D. Reese and W. A. Rogers, to operate the Grace Darling group of claims in lower Lake district, of which J. A. Yawger of Central City is in charge.

The Alps mine, Central City, has commenced shipping smelting ore running from \$125 to \$150 per ton. The mine is being worked by Central City people, J. Williams manager.

The Mammoth G. M. Co. states that it will resume operations on the Great Mammoth lode at Central City at an early date. The shaft, now 700 feet deep, will be sunk below the level of the Waterbury tunnel, which will be driven ahead into the workings to provide ventilation. W. H. Paul is Supt.

GUNNISON COUNTY.

The Colorado Smelting & M. Co. is pushing development in the Pitkin district. Five tunnels are being driven into the mining ground, to make 2000 to 3500 feet, cutting the formation as deep as 1600 feet. A. H. Reynolds is manager.

The Belzora-Bassick M. Co. of Michigan people owns a group of thirteen claims at Pitkin on which it has pushed development for several months. W. S. Henderson is manager.

LAKE COUNTY.

The Canterbury M. Co. has received a settlement for its first shipment of ore, made on a contract which gives the company a payment of \$2.36 per ton, on board cars at Leadville, the buyers paying treatment and transportation charges. As there is no water to be handled, and as the ore body is large and of uniform value, the product is mined and placed on the cars for not to exceed \$1 per ton.

The Phoenix M. Co. at Leadville is producing now about 175 tons of manganese iron per day, and expects soon to increase it to 200 tons per day. About ninety men are employed and the force is to be increased. The Colorado Fuel & Iron Co. is taking the production.

TELLER COUNTY.

The mill and smelter returns for Cripple Creek ore treated during the month of November are as follows:

| Colo.-Phila & Stand-Tons. | Av. | Value. |
|----------------------------------|--------|--------------|
| ard..... | 26,000 | \$30 780,000 |
| Union..... | 5,000 | 29 145,000 |
| Dorcas..... | 2,500 | 35 87,500 |
| Economic..... | 4,575 | 30 137,250 |
| Smelters and miscel-laneous..... | 21,000 | 70 1,365,000 |

Totals.....59,075 \$2,514,750

The Colorado Mines Con. Co. has been incorporated with C. S. Rickey, H. C.

Shimp C. R. Buschner, J. McConaghy, E. C. Sheldon, I. H. Glezen and B. Cunningham of Colorado Springs as directors, to mine at Cripple Creek. The capital of the company is \$2,000,000.

A steam hoist is being installed on the south block of the Teutonic mine, near Victor, at a 160-foot shaft, by the lessee, Mrs. Sharp of Victor. The shaft has about 60 feet of water, and after its discharge prospecting will be started for the flat vein of the Damon and for the Midway-Londonderry bonanza shoot. On the north block of the Teutonic, Kane & Co. have begun prospecting for the Damon shoot.

Eighteen inches of ore that assays \$192 in gold to the ton has been struck by A. Kenyon of Denver on the Bull hill lease after a few weeks' operation. The find was made in the main workings of the Atlanta near the Findley, and at a depth of 475 feet. The Gilpin & Cripple Creek Co., owner of the property, in prospecting incidentally ran within a few feet of where Kenyon has made a strike.

Assays running all the way from \$400 to \$2000 per ton are reported as being had from the 200-foot level of the Trachyte main workings, extended into the Deadwood territory of the New Zealand Co. The screenings from the ore body give an average of about \$200 in gold, while the coarse rock returns \$50 per ton average. The pay body is from 1 to 3 feet in width, and will average close to the latter.

It is said there is an increasing tendency on the part of mining companies to lease idle or undeveloped territory in Cripple Creek district. Nearly all the leases granted lately have been for not less than eighteen months, and some for three years. The royalties are made lower also, a flat royalty of 20% being the maximum asked. The greatest number of lessees on any one company's property at the present time is on the Gold Hill of the Anaconda Co. There are twenty-one working on the different blocks, and fifteen of them are producing ore and paying royalties into the company's treasury. Nearly every strike of importance made in November is credited to lessees. Among these are the finds of Terrill & Burke on the Colorado Boss, Barton & May on the Rhinoceros of the Gould Co., Brown and others on the Lone Star of the Anaconda Co., Lund, Mars & Bachman on the Rose Maud, Anderson on the Climax No. 2 of the Little Puck Co., the Cripple Creek M. & L. Co. on the Deadwood, Thompson and associates on the Pinnacle Co.'s ground and the Helen B. lease on the Arapahoe.

IDAHO.

ADA COUNTY.

In the Neal district near Boise the Elmore group and other promising claims will be developed this winter. The Sunbeam and Sunshine claims are to be developed by A. C. Fralick and W. L. Grose, who have bought them from Corder & Beck. The Ainslie stamp mill has been leased and will be kept in operation all winter. The Daisy extension, known as No. 13, bonded by J. J. Deming, W. Alley, W. McKinley and A. C. Fralick, is being developed by a shaft and the ore body is looking well.

IDAHO COUNTY.

Dunn & Wilkinson, stockholders of the Wild Rose mine, at Pierce City, have brought out twenty-seven pounds of gold bullion, valued at \$4000, the result of a 30-day run by the 2-stamp prospecting mill. The mine was discovered May 25, 1901, and since then there has been taken out over \$9000. The shaft has now reached a depth of 71 feet and the high values of the upper levels continue. The work of development will be continued throughout the winter.

F. Richardson and D. J. Brown of Boise, owning sixteen claims in the Thunder Mountain district, have arranged to sell them to a company represented by W. White.

P. B. Armstrong has completed the transfer of the Banner mine, at Florence, from the old company to the Florence G. M. Co., the new incorporation, owned in New York City. The new company has sent to the mine eighteen teams loaded with supplies and will continue development during the winter.

LATAH COUNTY.

The Golden Rod M. Co. has been incorporated at Moscow, with F. L. White president, F. Jenkins vice-president and manager and F. E. Cornwell secretary. The capital is \$100,000.

LEMHI COUNTY.

It is reported T. Keeting of Gibbonsville, Mont., and associates have bonded the Dark Horse group of mines in the main range of the Rocky mountains, near Gibbonsville, close to the Montana line. A force of men has gone from Salmon City to work on the property. The vein is 5 feet wide and is said to have a pay shoot which aggregates values of \$140 gold, silver and copper to the ton.

SHOSHONE COUNTY.

The Humming Bird M. Co. of Burke has elected W. Graham president and M. J. Farrell secretary, treasurer and manager. Work has been suspended in the upper works and the lower tunnel is to be worked on all winter.

The Atlas C. M. Co. has been incorporated in Spokane, Wash., to work a group of claims on the south side of Stevens peak, near Wallace. The capital is \$1,000,000 and directors are S. Douglas, F. S. Earnest, L. Wood, J. W. Douglas and B. D. Overholt.

The Gold Standard M. Co., Ltd., has been incorporated, with office at Wallace and capital \$1,000,000. F. Houle is president and R. V. Kuhn secretary. The purpose of the company is to work a placer mine on Pony gulch, near Delta, by the hydraulic method.

MONTANA.

FERGUS COUNTY.

The New Year group of mines, J. Meredith, manager, at New Year, 14 miles northeast of Lewistown, operated by the New Year G. M. Co. of St. Paul, will start their milling plant about Jan. 1, 1902. The plant has a capacity of 250 tons daily, is lighted by electricity and heated by steam.

The Great Northern M. & Dev. Co. has let a contract to Gulden Bros. for sinking a shaft 500 feet on the Standby claim, one of the Gilt Edge group. The shaft will strike the tunnel now being run into the ore body.

J. R. Cook has incorporated the Abbey mining group near North Moccasin; capital \$1,250,000. E. Johnson of Portland, Or., F. S. Ackley, J. L. Leavel and J. Wilmot are the other incorporators. A large amount of development work has been done on this group.

Lyons & Helsing will erect a 5-stamp mill on their mine near North Moccasin this winter and will commence mining in the spring. Their ore is free milling and assays from \$3 to \$5 per ton in gold.

The King-Barnes mines, near North Moccasin, has produced about \$20,000 in gold bullion since the commencement of work, five weeks ago.

GRANITE COUNTY.

The Highland M. & M. Co., recently incorporated by J. J. O'Meara, W. E. Deeney, G. Nissen, J. P. Brown and J. F. Duffy of Butte, has bought the 10-stamp mill of the Red Lion Co. and is now transferring it to its own mine in the Red Lion district on Flint creek, near Phillipsburg.

LEWIS AND CLARKE COUNTY.

Fire destroyed the Peck-Montana concentrator, located near Helena, on the 30th ult. The loss is \$160,000; insurance \$70,000. The plant was owned by the Missouri Power Co. and the Helena & Livingston Co. It is to be rebuilt.

A strike of 2 feet of good ore has been made in the 250-foot level of the Overland mine, near Helena. The mine is under bond to Mrs. A. M. Esler, with F. Esler as manager.

R. A. Panches' mine in Greenhorn copper district, near Helena, is regularly shipping iron ore to the East Helena smelter and copper ore to the Butte smelters.

It is reported that a new shoot of ore has been struck in the Howard mine, at Helena.

The force at the East Pacific mine, at Winston, has been increased to ninety-five men. The shipments from the East Pacific are nearly a carload a day.

NEVADA.

ELKO COUNTY.

The new mill for the mines of the King Solomon M. Co. at Charleston is under construction. The mines of the company, which is controlled by Ogden, Utah, and Lafayette, Ind., people, with W. C. Alexander manager, have about 3000 feet of development work done, showing the ore averaging about 20 feet between walls. In the main workings the ore shows an average of \$10 gold and from twenty to forty ounces silver. The mill will be of fifty tons capacity, arranged to be increased to 200 tons. A sawmill is being erected on the ground.

LYON COUNTY.

The Dyer group of copper claims in Mason valley have been bonded to J. A. Cruikshank of Cincinnati, O., at \$40,000 for nine months.

Varney, Johnson, Tailleux & Gammon of Virginia City, who bonded the Lizard mine 15 miles east of that place at \$12,000 a few months since, say they have taken out \$5000 already and expect to put a mill on the property in the spring.

NYE COUNTY.

Harris & Lambert have relocated the old Liberty mine, 12 miles north of Tonopah, which is said to contain pillars of ore in the old workings which carry values as high as \$400 per ton. They have bonded the mine to Colorado parties, represented

by a Mr. Ish.—L. A. Green and C. Peters of Tonopah own an extension of the Liberty mine, upon which ledges containing ore carrying values as high as \$119 per ton have been opened up by prospect work.

Very high grade ore is being taken out from various points on the Mizpah Lode of the Tonopah M. Co., at Tonopah, and from the Gold Hill, owned by Oddie, Brougher Bros. & J. W. McCullough. The lease of Carion & Co. on Gold Hill is now producing ore which assays 1980 ounces in silver and 32.50 ounces in gold per ton. No ore is being extracted from this lease of less value than \$400 per ton. A lease on the Valley View ledge is producing ore which assays 1700 ounces in silver and \$1100 in gold per ton. The big producers along the Mizpah ledge are now making efforts to secure room to store the increasing output of their leases, of which the 500 animals now hauling ore to the railroad are able to move only a small part. H. C. Cutting has cleared away ground near his shaft, and built up a rampart of filled ore sacks with which he will store several thousand tons of high-grade ore. It is rumored that an offer of \$50,000 for this lease was refused a few days ago. There are several leases on the Mizpah which it is believed will produce more than this amount between now and January 1st, 1902. The return from second-class Tonopah ore worked at the Taylor mill at Gold Hill was \$103 per ton, gold value.

WASHOE COUNTY.

In the Reno Star mine, near Reno, another vein has been cut which is believed to be richer than the first. It is said to be 25 feet wide and heavily mineralized.

NEW MEXICO.

COLFAX COUNTY.

The Granite Gap Copper Co. has been organized by Los Angeles, Cal., people, capital \$1,000,000, with J. DeBarth Shorb president, J. E. Hannon secretary and treasurer, and W. E. Robinson general manager, to operate nine copper claims near Stein's Pass. The ore recently developed is said to be rich.

The Thelma mine, near Elizabethtown, has been bonded to a company of which a Mr. Baker is manager. New buildings have been erected on the mine and the work underground is employing twenty-five or thirty men. A new mill has been bought for the mine. The ore is a concentrating proposition. The vein is about 36 inches wide and runs between two well-defined walls.

SANTA FE COUNTY.

J. Blonger has completed 200 feet of contract work on the Annie Jones mine for A. R. Gibson and W. S. Douglas in the Macho district, near Santa Fe. The values thus far are principally in copper, with some gold.

OREGON.

BAKER COUNTY.

An 80-ton cyanide plant is to be installed at the Flagstaff mine, 7 miles northeast of Baker City. It is claimed that cyaniding will save 95% or better of the values from the ore. The ten stamps are now crushing ore from the upper levels and an additional ten stamps are to be put in. J. E. Meikle of Baker City is consulting engineer for the owners.

The New York, a mining prospect in the Greenhorns, has been sold by W. C. Cowgill and C. C. Nopple to L. Y. Keady of Portland, representing Eastern men. The new owners will develop the property.

The Imperial mine, in the Cable Cove district, near Baker City, is reported to have been bonded by D. Eccles and J. Bourne at \$50,000—\$5000 cash paid. The Imperial was owned by Colbath, Crisman & Young and the late R. C. Chambers of San Francisco, and has produced some fine shipping ore. On the Imperial ledge is found a vein carrying galena, which continues as far as the long working tunnel has been driven.

CURRY COUNTY.

A 5-stamp mill is being built for the Mule mine located on Rogue river, 45 miles from its mouth. The ledge in the Mule mine is from 6 to 24 feet in thickness, and at a depth of 300 feet it is claimed assays \$33 to the ton.

GRANT COUNTY.

The Olive creek placer mines, 8 miles from Alamo, owned by J. Hinton, E. Houser and other Sumpter people, have been sold to W. C. Calder, D. Copping and D. L. Killen. It is the intention of the new owners to equip the mines for operation next spring.

While driving a crosscut tunnel to cut the main ledge in the South Cougar mine at Granite a large blind ledge has been cut that gives high values. The tunnel is now in 450 feet and will be continued for the main ledge, which it is expected will be reached within the next 100 feet. The

vice-president of the company, E. E. Stewart of St. Louis, Mo., is at the mine. JACKSON COUNTY.

The 10-stamp mill of the Ashland mine at Ashland, operated by the Montreal & Oregon G. M. Co. (Limited), is crushing from twenty-five to thirty tons of ore daily with satisfactory returns. Drifting is now being done on both ways from the shaft on the 800-foot level.

JOSEPHINE COUNTY.

J. W. Opp, who is operating the Golden Standard mine, in Jackson creek district, under bond, has five men getting out ore. The mill is being operated by McDonald & Meier. A test of 500 tons of ore is being made.

The Stalker hydraulic mines, situated at Althouse, have been sold by J. K. Stalker to A. Clemens of Philadelphia for \$4000, cash down.

The Spence-Cass copper mines, near Waldo, have been bonded by R. B. Whiteside of Duluth, Minn., at \$100,000, on long time, allowing for the complete development of the property. These mines consist of two groups of claims and are situated on Houck mountain. The veins are wide and carry values in copper and some gold. Mr. Whiteside is running two tunnels to crosscut the ledges.

MALHEUR COUNTY.

E. P. Cowan says of the Big Bend mining section at Ontario that, in his opinion, it greatly resembles the Witwatersrand banket district of the Transvaal, South Africa. The Singer shaft, he says, was sunk 87 feet. At 44 feet it encountered a conglomerate deposit carrying free-milling gold values ranging from \$6 to \$13 per ton. Fifteen feet deeper the deposit was the same and the values identical.

UNION COUNTY.

W. Muir, the owner of the Golden Star mine in Camp Carson district, west of La Grande, will work a force of men until spring. The Golden Star, he says, has 700 feet of tunnels and 1500 tons of ore on the dump. The Royal and the Standard are two other developed mines of this district and a number of prospects are being opened up.

UTAH.

BEAVER COUNTY.

For 150 tons of ore from the O. K. group of mines near Frisco, the Majestic M. Co. has received nearly \$13,000. The gross value of the ore showed an average of \$102 per ton. The proposition requires a furnace that will enable it to smelt the ore upon the ground.

The Powers M. & M. Co. has been incorporated, capital \$30,000. The officers are M. L. Powers president and A. Barnett secretary and treasurer. The company owns mining claims in Granite district.

BOX ELDER COUNTY.

The Monument G. M. Co. has been incorporated, capital, \$150,000. The company owns $\frac{2}{3}$ of the Monument claim, together with the Lupus Romulus and Remus claims in an unorganized district in this county. The officers are J. Rosevear president and G. Anderson secretary, with office in Salt Lake City.

A. C. Lochwitz, manager of the Sunrise M. Co., at Park valley, has been discussing with the directors of the company the advisability of putting in a new mill at the mine. Ore is being taken out which assays over \$20 a ton.

PIUTE COUNTY.

The Mt. Baldy G. M. & M. Co. has been incorporated, capital \$300,000. P. A. H. Franklin of Salt Lake City is the president and B. D. Luce secretary and treasurer. The corporation takes over the Henry group of twelve claims.

The Banner G. M. Co. has been incorporated, capital, \$125,000. L. H. Bartholomew is president and secretary. The company owns a large group of claims in Gold Mountain district, together with a bond on another adjoining group.

SALT LAKE COUNTY.

The Bingham Con. Co. has decided to build a large concentrator at mouth of Dalton & Lark long tunnel in Copper gulch, near Bingham, to reduce the second-class lead and copper ore to save the difference in cost of transportation to smelter that can be effected. A preliminary plant is to be installed as soon as it can be constructed, and work on the large mill will follow when by experimental work the most suitable processes shall have been decided upon.

SUMMIT COUNTY.

J. Hickey, manager of the Comstock M. Co., at Park City, says that before spring he expects to be ready for a mill of 500 tons daily capacity that he expects the company to provide him with.

The Daly-Judge M. Co., incorporated in New Jersey to mine at Park City, has appointed J. J. Daly of Salt Lake City as agent and attorney in Utah. The in-

corporators are H. O. Hanke, Cincinnati, Ohio; L. H. Wood, Mount Kisco, N. Y.; A. Fowler, Salt Lake City; W. B. Goodwin, New York City, and G. W. Rurde, Jersey City, N. J. The capital is \$150,000.

At the Wabash, at Park City, Foreman W. Campbell has received a large consignment of new boilers, air compressors and other machinery, which he is installing. The shaft is now down 175 feet.

TOOELE COUNTY.

The Honerine M. & M. Co. has been incorporated to mine the group of claims of that name at Stockton. The capital is \$2,500,000. P. S. Kimberly of Sharon, Pa., is president, W. G. Filer of Salt Lake City is secretary, and C. H. Scheu is manager. The property of the company embraces the Honerine, Quandary No. 2, Great Basin, Emerald, Homestead, Gov. Murray, Boston No. 2, First National, West Extension, St. Patrick, Contention, Victoria, Buckeye, Hercules No. 2, Sunflower, Gulch, Fraction, Wedge, Little Anna, Miriam, Texas, Marjorie and the Great Basin mill site. To handle the mines more economically the company is now preparing to sink a triple-compartment shaft, equipping it with a steam hoist plant and air compressor. The shaft is to be sunk 450 feet before any crosscutting is done and the raising of ore commences.

The Cyclone & Leap Year M. Co. has been incorporated at Salt Lake City with \$4000 capital, and H. H. Green president and O. W. Humrow secretary and treasurer. The property of the company consists of the Cyclone and Leap Year lodes in the Clifton district.

WEBER COUNTY.

The Glendore M. Co. has been incorporated in Salt Lake City, capital \$25,000. J. Lippman is president and J. James secretary and treasurer. The property of the company consists of sixty acres of ground in Erickson mining district, 40 miles distant from Fairfield. A shaft on the property is all in ore running well up in lead and 13 ounces silver and 40 cents gold per ton. It is the intention of the company to sink 100 feet.

WASHINGTON.

KITTITAS COUNTY.

The Sure Thing Gold-Copper M. & S. Co. has been incorporated, capital \$125,000, with G. W. Daines, A. R. Watson, J. Watson, J. R. Shearing and T. Collier, all of Kittitas county, as trustees. The office of the company will be in Spokane.

The Mother Lode mine, owned by the Mountain Gulch M. Co. of Farmington and Garfield, is claimed to be showing rich ore in all the workings. Two tunnels and a shaft have been run on the property. In the shaft, down 94 feet, an average assay of \$71 in gold has been obtained.

SPOKANE COUNTY.

The John Day M. Co. has been incorporated, capital \$65,000, with J. L. Wilson, C. S. Voorhees and R. H. Voorhees as trustees.

WHITMAN COUNTY.

The Blue Bird mine in the Hoodoo district, near Palouse, is to be reopened after having been closed down several months. A concentrator may be erected on the property. The stockholders have elected H. W. Greenberg of Spokane president, A. B. Harris of New Hampton, Iowa, secretary, and D. D. McDonald manager.

FOREIGN.

BRITISH COLUMBIA.

The Prospectors' Exchange of Nelson says: The development work on the Old Ironsides, Victoria and Grey mines, Greenwood, consists of 2256 lineal feet of sinking and raising, and 10,000 feet of crosscutting and drifting. The deepest shaft is down 400 feet and a diamond drill has proven that the ore reaches a depth of 800 feet. A quarry has been opened up in ore which is known to extend about 3000 feet on the company's ground, and to have a width of from 300 to 400 feet. The Black Warrior group in the Lardeau district has been bonded by D. A. Stewart and N. B. Weber of Winona, Minn., at \$60,000. C. N. Coursier, the vendor, retains an interest in the property. The Golden Crown mine in Wellington camp has resumed with a few men. The property is one of the first shippers in that camp and has sent out to date 2500 tons of first grade ore. P. V. Loth of Cincinnati, Ohio, has taken a bond on the Union Jack on Porcupine creek and the Wilcox mine on Wild Horse creek, Ymir district. He will work the properties during the winter. It is reported that the Canadian Pacific R. R. Co. has bonded a group of eighteen iron claims on Iron mountain, about 10 miles north of Wardner, B. C., at \$100,000, \$10,000 down and the balance in payments extending over a year. The second payment of \$2000 on the Bayonne group bond held by A. L. Davenport of Spokane has been made. These free gold claims were

located about three months ago. The C. P. R. are building a spur from Gladstone to the Cascade and Bonanza mines in the Boundary district. A contract has been made with the Granby smelter to deliver 500 tons. It is thought that the property will ship ten tons of ore daily throughout the winter.

Nelson, Nov. 25.

A rich strike has been made near Nelson by a company headed by J. P. Byrnes of San Mateo, Cal., which recently bought the Church group of claims. It is said the ore taken from the mine averages \$60 a ton, and a 9-foot vein has been opened up. From a pocket a piece of gold has been taken which is said to have netted \$1800. Plans for erecting a 20-stamp mill are under way. J. Champlin is Supt.

The third annual meeting of the Center Star M. Co. was held at Toronto on the 26th ult. The financial statement showed that during the year the company's indebtedness had been reduced from \$182,122 to \$42,120, besides paying \$175,000 in dividends. The old board of directors were re-elected. The report of the manager showed that during the year the ore sales were 80,419 tons, averaging \$14 64, smelter's gross assay value. The present ore reserves are estimated at about 44,000 tons, with smelter's average gross assay value of \$15 per ton.

Personal.

N. C. RAY has returned from Harrison Gulch to Coulterville, Cal.

C. SKOEFIELD is now manager the Newbury Mining Co., Pinal county, Arizona.

C. J. FREDERICKS is manager Columbia G. M. Co.'s operations at York, Montana.

HENRY A. BUTTERS of Salt Lake City, Utah, is looking after his mining interests at Steamboat, Nev.

E. P. PORTER of the U. S. Geological Survey is in Reno, Nev., securing mining data for government use.

W. H. PAUL of Leadville, Colo., has been appointed manager of the Mammoth G. M. Co. at Central City, Colo.

H. F. BROWN of San Francisco, Cal., is at Sims, Shasta Co., Cal., engaged in an examination of an asbestos deposit.

FREDERICK HOAR succeeds S. A. Parnall in the management of the Old Dominion copper mine, Globe, Arizona.

SUPT. BUZZO of the Alice mine, Walkerville, Mont., is asked to furnish 10,000 tons of zinc ore on an Eastern order.

S. E. ROBBINS, metallurgist at the Balakala copper mine, near Redding, Cal., has returned to the mine from Salt Lake City, Utah.

WM. PEARCE has been appointed assistant foreman of all the Gold Hill, Nev., Comstock mines, from the Con. Imperial to the Caledonia.

W. A. PRICHARD has resigned as Supt. Keystone Con. M. Co., at Amador City. He has accepted a similar position at Coolgardie, West Australia.

R. H. POSTLETHWAITE has returned to San Francisco, Cal., from a reconnaissance through New Mexico, where he will place some gold dredgers.

T. E. SCHWARZ, who for the past three years has been manager Iron Silver M. Co., Leadville, Colo., has resigned and removed to Denver, Colo.

J. B. EARLY and ROBERT MILLS are respectively president and secretary of the American Mining Association of the Philippine Islands at Manila.

ROBERT ANGUS, formerly Supt. Iron Mountain mine, Missoula, Mont., says he is now Supt. Le Roi mine, Rossland, B. C., at a salary of \$12,000 per year.

A. CARPENTER, M. E., has returned to his home in Oakland, Cal., from Sumatra, where he is engaged in hydraulic mining. He expects to return there in January.

E. L. SHAFNER of Cleveland, O., president International Mining Congress, is in Butte, Mont., in connection with the proposed 1902 session of the Congress in that city.

J. STARK has been appointed Supt. Logan and Eagles mines at Cripple Creek, Colo., succeeding P. Eisenhart, who has become Supt. Lincoln mines at the same place.

BEN STANLEY REVETT of Breckenridge, Colo., contemplates a trip to Ivory, on the west coast of Africa, being consulting engineer for a French mining company operating there.

D. C. JACKLING, late Supt. Republic mill at Republic, Wash., has been appointed consulting engineer to the United States Reduction & Refining Co., which is operating mills at Florence and Colorado Springs, Colo.

BERNARD MACDONALD, late manager B. A. Corporation, Rossland, B. C., is credited with intention to assume a simi-

lar position with the Anglo-Canadian Lead Syndicate, Lake Temiscamingue, Quebec, Canada.

W. S. MCCORMICK, J. E. BAMBERGER AND E. F. HOLMES of Salt Lake City, Utah, are in New York, representing the lead mining interests of Utah in the conference now on between the miners and smelting interests.

Commercial Paragraphs.

THE Atlas Pipe Wrench Co. report that a well known jobbing house in the Middle States has placed four orders for quantities of Atlas pipe wrenches in the last forty days—a new stock order every ten days.

THE Pacific coast office of the Allis-Chalmers Co. is at 137 Montgomery St., San Francisco, Cal.; Mr. George E. Ames is the Pacific coast representative of the company, and is in charge of their San Francisco office.

THE Globe Iron Works, Stockton, Cal., are supplying their Globe battery stem guides to the Golden Chest M. Co., Murray, Idaho, and the Liberty Bell Gold M. Co., Telluride, Colo. They also report considerable demand for the Truax ore cars, the manufacture and sale of which they control on the Pacific coast.

THE aerial wire rope tramway of the New Year G. M. Co., at New Year, near Lewiston, Montana, is finished. Its exact length is 5150 feet and it has a guaranteed capacity of twenty-five tons an hour. It is a Bleichert wire rope tramway, and cost \$17,500. This is the first wire rope tramway ever erected in that county, and was furnished by the Trenton Iron Co. of Trenton, N. J.

AT the Fulton Engine Works, Los Angeles, Cal., has been completed a framework for a telescope ordered by the Lick Observatory at Mt. Hamilton, Cal. The work is up to specifications and has been passed upon by observatory officials. The steel in the framework weighs 8000 pounds; the tube for the lenses is 40 inches diameter and 16 feet long. The main pivotal bearings are two 14-inch steel rollers on phosphor-bronze bearings. The lenses are made in the East at a cost of about \$10,000. The instrument goes to Mt. Hamilton for testing purposes only, and goes thence to Chile.

THE Crocker-Wheeler Co. of Ampere, N. J., reports being pushed to its utmost to keep up with the large number of orders it is daily receiving and has on hand. They are constantly adding to the number of factory hands, and have for some months been working a regular night shift. Among shipments made during the last month are two 520 K.W. generators for the American Smelting & Refining Co., Perth Amboy, N. J.; three 400 K.W. and one 100 K.W. for the Alsen Cement Plant, West Camp, N. Y.; one 400 K.W. generator for the Christenson Engineering Co., Milwaukee, Wis.; one 300 K.W. generator for the Balbach Smelting & Refining Co., Newark, N. J.; three 200 K.W. generators for the Stetson & Co.'s New Power Plant, Philadelphia; one 375 K.W. generator for the Anglo-American Provision Co., Chicago, Ill.; one 400 K.W. and one 75 K.W. for the Lake Shore & Michigan Southern Railroad; one 200 K.W. generator for the Vandergrift Construction Co., for railroad work; one 200 K.W. generator for the Crucible Steel Co., Blair, Pa.; one 150 K.W. generator for the Latrobe Steel Co.; one 200 K.W. generator for the Otis Elevator Co., and one 100 K.W. generator for the United States Tube Co. They have also completed the entire shipment of the 45 K.W. direct-connected generator and fifty or sixty motors for the Government Printing Office in Manila, Philippine Islands. Among the orders recently received are noted the following: Two 300 K.W. generators for the Singer Mfg. Co., South Bend, Ind.; two 200 K.W. belted generators for Sayre & Fisher, Sayreville, N. J.; one 60 K.W. and one 30 K.W. generator for the Orange Brewing Co., with various motors ranging from 35 H. P. to 2 H. P. in capacity; four 140 K.W. generators for the Fort Hill Chemical Co., Rumford Falls, Me.; two 75 K.W. generators for Henry Lang & Co., Newark, N. J.; one 90 K.W. generator for the United States Electric Lighting Co., Washington, D. C. Shipment of thirteen motor-dynamos for the Western Union Co.'s plant, Milwaukee, Wis., and the electrical equipment of Skinner & Sethman Publishing Co.'s plant, Denver, Colo., consisting of 40 K.W. generator and twenty-eight motors, will also be made this month.

Obituary.

GOTTHA HAIST, an old and well-known Nevada mining engineer, died on the 3rd inst. at Virginia City, Nev., in the 78th year of his age. Deceased was a native of Stuttgart, Germany.

Latest Market Reports.

SAN FRANCISCO, Dec. 5, 1901.
SILVER.—Per oz., Troy: London, 25½d (standard ounce, 925 fine); New York, bar silver, 54½c (1000 fine); San Francisco, 54½c; Mexican dollars, 47c San Francisco, 43c New York.
COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$16.85; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.60; carload lots, \$16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22@23c. London: £55 5s per ton.
The market can be described as demoralized. While prices are nominally held up in New York, statements of sales made below the open figures are persistent; the market price for standard in London is quoted at 12 cents a pound. With this difference it would seem impossible to keep the open prices up in this country.
LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 8, sheet 6½, bar 5½c; pig, \$5.25. London, £11 per ton—2.41 cents per lb.
SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton —3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.
ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13@15c.
IRON.—Pittsburg, Bessemer pig, \$16.50; gray forge, \$14.00; San Francisco, bar, 2.60c per lb., 2.65c in small quantities.
STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.
NICKEL.—New York, 50@60c per lb.
TIN.—New York, pig, \$27.50; San Francisco, ton lots, 27c; 1000 lbs., 27½c; 500 lbs., 27½c; 200 lbs., 27½c; less, 28c; bar tin, 28½c, 32½c.
PLATINUM.—San Francisco, crude, \$19 per oz.; New York, \$20.50 per Troy oz.
BISMUTH.—New York, 2½c, 2.2c 50-lb lots; San Francisco, 2.50 to 2.75 per lb. lots.
QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 per flask of 76½ lbs.; Export, \$45.00.
MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.
ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.
ALUMINUM.—New York, No. 1, 99c pure ingots, 35c; No. 2, 90c, 30c to 35c.
SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.25c.
PHOSPHORUS.—F. O. b. New York 50@60c per lb.
FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).
POWDER.—F. O. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2*, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.
CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.
FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.
CANDLES.—Granite 6s, 16 oz., 40s., 10c per set; 14 oz., 40s., 9c.
CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 30@31c per lb.; carloads, 28@29c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$1.90 per 100 lbs.; hyposulphite of soda, 2½@3c per lb.; blue vitriol, 5½@6½c per lb.; borax, concentrated, 7@8c per lb.; chlorate of potash, 12@13c; roll sulphur, 6c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½c; California refined, 1½@2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3@4c per lb.; Cal. s. soda, bbls., \$1.00; sks, 95c per 100 lbs.; chloride of lime, spot, \$2.50@2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.
OILS.—Linsed, pure, boiled, bbl., 74c; cs., 79c; raw, bbl., 74c; cs., 78c. Deodorized Stove Gasoline, bulk, 14½c; do., cs., 20½c; 86° Gasoline, bulk, 20c; do., cs., 26c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13½c; do., in cs., 19½c; Lard Oil, Extra Winter Strained, bbl., 75c; cs., 80c; No. 1 bbl., 50c; cs., 55c. Neatsfoot Oil, cooper's bbls., 60c; cs., 65c; No. 1 bbl., 50@52½c; cs., 55@57½c.
COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallsend, \$8.00;

Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.
Recently Declared Mining Dividends.
Osceola Con. M. Co., Mich., \$3 per share.....Dec. 23
Bunker Hill & Sullivan M. & C. Co., Idaho, monthly, \$21,000.....Dec. 4
Last Dollar M. Co., Colo., quarterly, 2 cents per share, \$30,000.....Dec. 10

Notices of Recent Patents.
Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:
PHOTOGRAPHIC CARD MOUNT.—No. 687,411. Nov. 28, 1901. P. J. Stuparich, San Francisco, Cal. This invention consists in forming the card with a pasteboard or similar paste of considerable thickness and applying to the front a thin veneer of wood which is submitted to the card-board to form a substantially integral part thereof, and the surface thus formed may be afterwards indented or impressed by a die of any suitable or desired form.
TREE SUPPORT.—No. 687,529. Nov. 28, 1901. A. A. Hoyt, Watsonville, Cal. This is a device for supporting the limbs of trees to prevent their being broken by weight of fruit. It consists of a wire hook having two members or jaws adapted to engage the limbs and clamp them, and two of these clamps upon opposite sides of the body may be connected together by a rope or wire so that they are practically self-supporting.
SCHOLARS' COMPANIONS.—No. 687,412. Nov. 28, 1901. Anna W. Trescott, Oakland, Cal. The object of this invention is to provide a convenient holder for pencils, pens, erasers, rulers and like instruments, the holder being of such a nature as to prevent the noise and clatter usually caused by the movement of such articles. It consists of a flexible back having a variety of compartments made in it suitable for the articles, and means for removably attaching it to the desk or other part where it is to be used.
MAIL BOX.—No. 687,528. Nov. 28, 1901. W. G. Hawley, San Jose, Cal. Assigned to Bates Hawley Postal Box Signal Company of San Jose, Cal. This mail box is designed especially for the rural delivery system and consists of a box having a longitudinal side opening near the top, an inwardly and upwardly swinging flap by which the opening is normally closed, with means for preventing the ingress of moisture around the edges of the flap, a perforated corrugated bottom for the box and a sharp or cone-edged partition to prevent pilfering. Signal devices are disposed at

either end of the box to notify the carrier and the recipients of the mail respectively when anything has been deposited in the box for them.
ATTACHMENT FOR AUTOMATIC PIANO OR ORGAN PLAYERS.—No. 687,559. Nov. 28, 1901. A. T. Derby, San Francisco, Cal. This is a self-playing attachment for pianos and organs, and has particular relation to a means for muffling the sounds caused by the scraping of the paper over the tracker-board and the suction of the air through the tubes, as well as the movement of the levers which govern the time, expression, etc. Devices are also provided by which both the loud and soft pedals of the instrument are under convenient control and the tone shading during the performance upon the instrument is very greatly improved.
TRAVELING SPRAYING APPARATUS.—No. 687,390. Nov. 28, 1901. G. A. and R. F. Dunn, Dinuba, Cal. This device is designed for the purpose of spraying trees and plants with mixtures or solutions which are designed to destroy insects and vermin and to otherwise improve the condition of the plants. It comprises a hollow cylindrical roller journaled in a frame and adapted to contain a solution, pumps mounted upon the frame and connections by which the pumps are driven from the revolving roller, suction pipe connections between the pumps and the interior of the roller agitators so constructed as to revolve within the roller out of contact with the suction pipe and a removable corrugated jacket exterior to the drum to give it proper tractive force and prevent its slipping on soft ground. A supplemental receiving cylinder is employed through which the mixture is pumped under pressure, and from which it is delivered through a suitable exterior filter to the spraying pipes.
New Patents.
DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:
FOR WEEK ENDING NOVEMBER 26, 1901.
687,392.—SHAFT KEY—M. P. Boss, S. F.
687,393.—SHAFT KEY—M. P. Boss, S. F.
687,398.—STEAM BOILER—R. H. Botts, Richmond, Cal.
687,396.—REAMING TOOL—J. S. Brown, Los Angeles, Cal.
687,559.—ORGAN PLAYER—A. T. Derby, S. F.
687,396.—SPRAYING APPARATUS—G. A. and R. F. Dunn, Dinuba, Cal.
687,521.—TRY SQUARE AND BEVEL—D. Elrod, S. F.
687,218.—FARREL CARRIER—Gabriel & Atkinson, Portland, Or.
687,458.—PICTURE EXHIBITOR—G. W. Giles, Garfield, Wash.
687,538.—MAIL BOX—W. G. Hawley, San Jose, Cal.
687,529.—TREE SUPPORT—A. A. Hoyt, Watsonville, Cal.
687,243.—MESSAGE MACHINE—F. King, S. F.
687,378.—HOSE NOZZLE—D. F. Leahy, S. F.
687,475.—HOP DRYING BOX—J. K. Mount, Silverton, Or.
687,408.—TUBE FLARER—Scott & Hightower, S. F.
687,411.—PHOTO MOUNT—P. J. Stuparich, S. F.
687,412.—SCHOLARS' COMPANION—Anna W. Trescott, Oakland, Cal.
687,447.—BUTTON—F. E. Williams, Alhambra, Cal.
35,329.—DESIGN—F. M. Gilham, S. F.

Lassiat, in the Lassiat Mine, at Foker Flat, Sierra Co., to deposit tailings in a worked-out pit, given notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on December 23, 1901, at 1:30 P. M.

ASSESSMENT NOTICES.

NATIONAL CONS MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of November, 1901, an assessment (No. 15) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 23d day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. GEO. W. FLEISSNER, Secretary. Office—773 Mission street, San Francisco, California.

ORLEANS CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of November, 1901, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 324 Pine street, Room 10, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1901, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 30th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. GEO. P. THURSTON, Secretary. Office—324 Pine street, Room 10, San Francisco, California.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 7th day of November, 1901, an assessment (No. 11) of two cents per share was levied upon the capital stock of the corporation, payable immediately to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 6th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

N. F. REMINGTON, Secretary. Office—112 Main street, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of November, 1901, an assessment (No. 35) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 11, tenth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 10th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. CHARLES E. ANDERSON, Secretary. Office—Room 31, tenth floor, Mills Building, San Francisco, California.

MOHICAN MINING & MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of November, 1901, an assessment (No. 2) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 800 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3d day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. JNO. W. OLASSEN, Secretary. Office—No. 800 California street, San Francisco, California.

MARINA MARICANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of December, 1901, an assessment (No. 20) of four cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. CHAS. BOVONE, Secretary. Office—217 Sacramento street, San Francisco, California.

HOISTING PLANT.

This cut illustrates our 4 H. P. to 8 H. P. Larger sizes built to suit the demands of our customers.

It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake. No better device has been designed for this purpose. For prices and further information address the builders. Oriental Gas Engine Co., 227 Folsom St., S. F.

**Kendall's Patent
 Quartz Mills.**

Having renewed our contract on more advantageous terms with Mr. S. Kendall for the manufacture of his Patent Quartz Mill, we are enabled to offer these mills at Greatly Reduced Prices. Having made and sold these mills for the past 16 years, we know their merits, and know that they have given perfect satisfaction to purchasers, as numbers of commendatory testimonials prove. We feel confident, therefore, that at the prices we are now prepared to offer them, there is placed within the reach of all a light, cheap and durable mill that will do all that is claimed for it and give entire satisfaction.

“THE DANIEL BEST” 50-Horse Power Traction Engine.

Freight carrying capacity of wagons,
16 TONS EACH,
or a total capacity of train,
48 TONS.

CAPACITY
OF
ENGINE,
50-Horse Power.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes.

EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled.
Estimates made for complete Steam Freighting Outfits. Address

THE GRIFFIN

THREE ROLLER

ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

SUCCESSOR TO

GATES IRON WORKS, Chicago,
DICKSON MFG. CO., Scranton.

MANUFACTURER OF

Mining Machinery

There are
reasons
why

the adjustable and practically indestructible GATES ROCK AND ORE BREAKERS produce crushed material at a much lower cost per ton than other breakers. To more than 5,000 users located in all parts of the world, the cause is readily apparent. Gates Breakers not only have much greater capacity, require less power, run without vibration, stoppage or delay, with less wear on the crushing surfaces and permitting carloads of material to be dumped directly into the hopper of breaker, thus reducing the employment of handling devices and manual labor to the minimum, but other convincing reasons supported by indisputable evidence of the superiority of Gates Breakers are given in Gates Catalogue No. 1. Avoid a false start and possibility of failure. There is absolutely no breaker made that will compare with the "Gates."

We are prepared to build crushing plants complete, screens and perforated metal of all kinds, elevators, hoists, engines, and boilers. We also build cement machinery of the latest designs. ESTIMATES FURNISHED UPON APPLICATION.

Corrugated Pneumatic Hose.

Made absolutely seamless in the fabric as well as in the cover. So constructed as to form, practically, a compact body. No splitting of the tube and opening of the plies, much lighter and more pliable, and will stand shorter bends without kinking than hose made in the ordinary way; will withstand a greater air pressure than any hose double its weight offered on

the market. We guarantee this hose to outwear any other style or make of hose for the conducting of air under pressure, whether for drills, hoists or pneumatic tools, and we are satisfied, beyond any doubt, that for this work it is by far the most desirable and economical hose manufactured.

Plain; Wound with Flat or Round Wire; or Covered with Woven Marline Jacket. Sizes 3-8, 1-2, 3-4 and 1 Inch.

THE MAP SHOWS--

The shaded part shows that where the most metal mining is done the MINING AND SCIENTIFIC PRESS has the largest part of its circulation. It tells its own story. The MINING AND SCIENTIFIC PRESS is the only mining paper that has a general circulation therein.

Every advertiser in the MINING AND SCIENTIFIC PRESS, whether he pays for an inch or a page, knows that he weekly talks to the men who do the buying. He knows his audience just as sure as though he could look into their faces or shake hands with them. He knows that his announcement is weekly seen by the men throughout this west half of America who are thoroughly representative of the great metal mining industry of the country.

The readers of this paper have bought mining machinery and supplies to the extent of over \$150,000,000 in the last ten years, and their annual purchases now exceed \$18,000,000. Its advertising pages are referred to everywhere by intending purchasers of mining machinery or supplies as a directory for that purpose. The paper refuses questionable advertising, and its thousands of readers learned long ago, to their satisfaction, that the appearance of an advertisement in its columns is of itself good

evidence of reliability. An advertiser in this paper is in good company.

In advertising, results are what count. It is not what an advertisement costs, but what it produces, that determines its value. Leading concerns

who continuously buy advertising space herein, say that it is not an experiment, but a profitable investment to advertise in the MINING AND SCIENTIFIC PRESS. Its rates, comparatively, are "cheaper" than those of any other similar publication. "Cheapness" is not regulated by what you pay, but by what you get for what you pay. Advertising in this paper, if properly backed up by what is advertised, insures profitable publicity.

The region shaded on the map has a POPULATION OF TEN MILLIONS ---MINING IS ITS CHIEF INDUSTRY.

No advertiser who sells to mining men would omit using this journal if he knew the truth about it.

If from any reason anyone thinks "Advertising doesn't pay," we would like to furnish him with evidence that the right kind of advertising does pay. Economy in advertising is like economy in everything else—judicious expenditure of money. The results of an advertisement are what determines its value.

MINING AND SCIENTIFIC PRESS,

330 MARKET STREET,

SAN FRANCISCO, CALIFORNIA.

SPADONE'S CONCENTRATOR BELTS.

PATENTED.

This illustration shows the edge fanging out-wardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

AMALGAM PLATE CLEANERS.

Our Amalgam Plate Cleaners are made of Pure Rubber in moulds, thus insuring a plate cleaner which will not scratch the plates and a perfect edge which will clean the Amalgam plates evenly. They are made 6 inches long, 3 inches wide and 1/4 inch thick, making a convenient size to handle. Price by mail to any address, each 75 cents. Correspondence solicited.

Send us your order for Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING, RUBBER PACKING and LEATHER BELTING.

COMMUNICATIONS CONFIDENTIAL.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports since 1793, with full copies of U. S. Patents since 1872. As a result we are able to give reliable advice as to the patentability of an article, frequently saving the inventor the cost of an application. Our Washington branch tends exclusively to our business before the Patent Office. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, including filing of Caveats, Trade-Marks, Copyrights, Labels; prepare Assignments, Licenses and Agreements; give Opinions on Patentability and Infringements, etc. Circulars free on application.

DEWEY, STRONG & CO.,

STURTEVANT MILL CO., 113 Clayton St., Boston, Mass.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

IRON CEMENTS

For stopping leaks and pitting in marine boilers, for boiler patching, for repairing leaks and fractures in steam and hydraulic work, and for repairing bluish iron or steel castings. These cements are prepared in powdered form and applied by mixing with water; when hard they will withstand a red heat, steam, water or oil, and expand and contract the same as iron. Write for illustrated catalogue and prices; when ordering state for what use.

ADAPTABLE TO THE ORE==THE AMERICAN STEAM STAMP

will run without close attendance after being easily set to deliver the blow best suited to the ore; very rapid heavy blows for tough hard ore, gentler treatment for sliming friable ore.

THE MILL FOR FRONTIER USAGE--THE AMERICAN STEAM STAMP

has the "steam hammer" valve and the "wedge base" adjustment for wear of shoes and dies. These work perfectly with unskilled handling. The American gives no trouble, is durable and unfailing.

Though built for heavy and continuous service, it requires only small foundations, thus avoiding any great expense or labor in installation. We make the mills sectional for muleback when so ordered. We also make gravity stamps.

ASSAYING, AARON'S—PART I—GOLD
AND SILVER ORES:

Fourth edition; Rewritten and Improved; 130
pages, illustrated.....\$1

ASSAYING, AARON'S—PARTS II AND III:

Third edition; Revised and Rewritten. Now
ready; new type; new illustrations; new matter;
better than ever; reduced in price.....\$1 50

MODERN COPPER SMELTING:

B. Dyer Peters, Jr. Eighth edition. Rewritten
and enlarged. Profusely illustrated.....\$5

STAMP MILLING OF GOLD ORES:

By T. A. Rickard, M. E. Well illustrated.
Cloth.....\$2 50

MANUAL OF MINING:

For the use of Mining Engineers and Technical
Schools. M. G. Hiesing. Third, revised and en-
larged, edition. 648 pages, 8vo., cloth.....\$4

GOLD MILLING—PRINCIPLES AND PRA-
TICE:

Breaking; Sorting; Wet and Dry Milling; Amal-
gamation; Concentration; Roasting; Chlorina-
tion; Cyanidation; Melting Bullion; Smelting
Ores and Concentrates; Complete Systems, Re-
sults and Costs; Tables and Forms. C. G. Warn-
ford Lock.....\$10

THE METALLURGY OF GOLD:

By M. Elsasser. 5th edition. Profusely illus-
trated.....\$7 50

QUARTZ OPERATOR'S HANDBOOK:

By P. M. Randall.....\$3

CYANIDE PROCESSES FOR GOLD AND
SILVER ORES:

By E. B. Wilson E. M.....\$1 50

PROSPECTOR'S FIELD BOOK AND GUIDE:

4th edition, just out. By H. S. Osborn.....\$1 50

PRACTICAL TREATISE ON HYDRAULIC
MINING:

By Aug. J. Bowie, Jr. On the use and construc-
tion of Ditches, Flumes, Dams, Pipes, Flow of
Water on heavy grades, methods of mining shal-
low and deep placers, etc.....\$5

PRACTICAL HYDRAULICS:

A book for Civil Engineers, Miners, Millmen,
Hydraulicians, Mining Engineers and Irriga-
tors. By P. M. Randall.....\$2

TUNNELING:

Blasting, Timbering, Air Drilling, etc.; 1000
illustrations; Drinker, 3rd edition.....\$25

CYANIDE PROCESS:

Practical Notes on: Bosqui.....\$2 50

ROASTING OF GOLD AND SILVER ORES

AND THE EXTRACTION OF THEIR

RESPECTIVE METALS WITHOUT

QUICKSILVER:

Second edition; Guido Kustal, M. E.; 156 pages,
with illustrations of furnaces, supplements and
working apparatus.....\$3

MINERALOGY:

Brush & Penfield, revised edition.....\$4

Dana, New System.....\$12 50

WOODBURY'S IMPERIAL CONCENTRATING TABLE.

THE Imperial Concentrating and Amalgamating Table is the latest invention of Mr. Geo. E. Woodbury, whose fame as one of the pioneer concentrator builders is world wide, machines of his manufacture being in general use in every country on the globe where the milling of ores is carried on. This Table is, however, built on entirely new lines, differing materially from either the well-known belt or bumping table types of concentrators.

SIMPLE IN ITS
CONSTRUCTION.

SAVES FINE
SULPHURETS.

WITHOUT LOSS IN TAILINGS.

Paint

For Miners==

P & B Paint is the paint for miners—it is used everywhere about a mine.

It preserves wood, brick, stone and metal from gases, fumes, moisture, heat, cold and acids—makes flumes water-proof; resists action of mine-water on timbers and pumps; protects vats, pans and pipes from sulphuric and all acids and chemical action.

Enables roofs, sheds, etc., to withstand fumes, heat, cold and moisture. Comes ready to use and any one can apply it—requires no heating, stirring or mixing.

*From Anaconda Copper-Iron Co.,
Butte, Mont.*

"P & B Paint has been used for years on the pump columns and other iron work in and about the mines of this company, and has been found to resist the action of the mine-waters. It has also been very largely used in Electrolytic Refinery at Anaconda."

THE "JAMES" AUTOMATIC ORE FEEDER.

THE "JAMES" ORE FEEDER,

as illustrated on this page, is a machine of improved design for the automatic feeding of ores to stamp batteries and other crushing machinery. It is perfectly adjustable while in operation, and will feed equally well ores wet or dry, coarse or fine.

Shipping weight, with wood frame, - 800 pounds.

" " " iron " - 1000 "

ADVANTAGES

The advantages of this ore feeder, over any others that are in the market, are, that the feed is positive and will not gig back no matter how slight the motion to the arm; it can not possibly spill ore of any character and will definitely measure out from one to fifty tons per day of any class of ore.

The Philippine Miners' Memorial.

The American Miners' Association of the Philippine Islands has been organized at Manila. It has adopted a memorial to Congress which appeared in full in the last number of this journal. The prayer of the memorial is a request of Congress that it extend the United States mining statutes to the public lands of the Philippine Islands.

From the recitals it appears that between 1500 and 2000 American prospectors are in the islands taking up and developing mining claims, organizing local mining districts and establishing local laws and customs, just as they would under similar circumstances in the United States. It does not appear that at this time there is any disturbing element, except uncertainty as to the future. Such of the lands of the Philippine Islands as were not in private ownership at the date of the treaty by which Spain formally transferred sovereignty, are unquestionably public lands of the United States. The equity of title to them rests with Congress until it makes a grant of them. The functions of the Philippine Commission, so far as grants and the equity of real property titles are concerned, are administrative. The precedents of legal decisions are all against any other theory of their function. They would seem to have, so far as the mining claims already located are concerned, the rights of adjudication as between claimants, and would, in adjudicating rights, be compelled to recognize and apply the local laws and regulations of the miners. There are no other laws in existence that can be considered as in force for this purpose. The Philippine Commission, however, have as yet no laws under which they can adjudicate rights as between mining claimants and the United States. The continuing of the old Spanish statutes in force until Congress has substituted something else can only be construed as applying those laws to the adjudications necessary with respect to private rights that already existed by grant of the Spanish Government. They cannot be applied to mere possessory rights to mining claims which are not yet

grants of title by Congress. They might apply if Congress, by grant, expressly validated the locations of claims already made, without at the same time providing by statute for the adjudication of the mining titles it created.

As matters are now, the Philippine Commission cannot interfere with the miners and prospectors. The latter have, it would seem, much the best of circumstances, excepting only the disturbing element of uncertainty noted above. There is no occasion to exaggerate this. Congress and the courts, which have had before them many times, identical questions to this one of the Philippine mining claims, will

hardly depart from the settled practice they have established. It may be accepted as assumed beyond question that they will recognize and validate all mining claims that are made before they pass mining laws, and all mining laws, customs and regulations that the miners themselves establish will be recognized and accepted. They may, however, substitute other conditions of grant for mining claims made subsequent. Here is the real danger to the Philippine miners. It is better for them to have no mining laws, except such as they themselves make, rather than have a code of laws which will not fit the conditions as they are in the Philippine Islands. The example of Alaska miners, struggling under misfit laws, should be sufficient in this respect. Also, when mining laws are made for the Philippines at least one provision in the laws of the United States should be eliminated. There should be no grant of extralateral rights. The mining claims that now exist in the Philippines as Spanish grants have no such rights. There is no reason for granting such rights to new claims. It is only conferring on the Philippine mining industry a heritage of never-ending litigation.

It may be urged as a ground for action by Congress that there is no law under which mining claims in the Philippine Islands can be patented. This, if anything, is rather an advantage. Public policy is better served by having the mines continuously worked as possessory claims, than by having them remain unworked as patented claims.

The memorial would seem to have been hastily prepared, in anticipation, perhaps, of anticipated legislation less favorable than the existing United States mining statutes. This last is, however, exceedingly unlikely to occur, and a formal investigation by Congress as to what the miners and prospectors are doing for themselves, precedent to its action by legislation, cannot operate to the ultimate disadvantage of the miners. The statement of the memorial that there are between 1500 and 2000 prospectors and miners now at work in the islands speaks exceedingly well for their prospective mineral wealth.

Late Gold Dredging Practice.

In this issue appears the concluding portion of a paper on late gold dredging practice, by R. L. Montagu. The data are up to date. Mr. Montagu's late professional work has been in the Oroville, Cal., gold dredging field, where there is more gold dredging being prosecuted than in any other equal area, and where all the novel problems that have come up in the industry have been successfully worked out.

The paper, it will be noted, is particularly clear and complete on the details of electric power application. This is the latest novel feature of gold dredger construction and operation. Not at all an essential element, it is value and profit in that it reduces costs and increases efficiencies. That it should so rapidly have become a feature of the business is strong evidence that the mechanical problems connected with the removal from place of the gold bearing deposits, and the recovery of the gold from them, have been satisfactorily solved. The application of electricity to an industry is of the nature of the finishing work of decoration to it.

Mr. Montagu's statement of the possibilities and limitations of the industry are worth considering by prospective investors in gold dredging enterprises. The business is fascinating so long as it remains untried; ultimately it may become as commonplace as digging potatoes. But until it does become commonplace there is danger to the prospective investor from expecting too much of it. This should be avoided, and the conservative discussion of the subject that this journal has given in such elaborate detail is intended to that end.

THE value of a technical journal to its readers is entirely in the use made of the information that it publishes. All that one working in mining or metallurgy would need to know is not comprised in a single issue of the MINING AND SCIENTIFIC PRESS or any other technical journal. All that one would wish to know or could know in any of these special lines of work does not become published. But the student or worker can keep himself in touch with all that is new in his line of investigation or work, and keep himself up to the highest possible standards of efficiency by taking the technical journal that deals with his specialty and making use of the new information that it is constantly diffusing. These lines are suggested by letters received by this journal in which the writers acknowledge its service to them in their specialties. The method they employ should have the sincere compliment of imitation. Each for his specialty makes a scrapbook of clip-

pings from this journal which relate to his specialty. For one it is the cyanide process, for another gold dredging, a third is studying the wet metallurgical processes. Such a scrapbook keeps the historical sequence of advance in an art, and graphically presenting it as a whole, aids the selective faculty of the mind. There is so much to learn in any art that avoidance of having to unlearn anything is the best kind of labor saving. The readers of this journal will find it even more valuable and indispensable to them in their work if they collate and use the information it publishes on their specialties.

Copper Mines and Copper Miners.

Nearly three years of 17 cents a pound copper, contrasted with twenty-five years preceding of copper selling from 7 to 11 cents a pound, is responsible for an enormous sum of existing investment in the business of copper mining. Now that 17 cents a pound copper is passing into history, an estimation of its permanent effect on the industry is a timely matter of consideration for the owners of copper mines.

In this consideration there are three elements of which account is to be taken: They are the copper mines; the copper miners, who are the people who mine copper for the legitimate profit margin between cost of production and market selling price, and the copper mining stock speculators. This last has special reference, not to people to whom stock in copper mines is an investment in a safe mining business, but to a lesser number to whom stock in copper mines is an opportunity to mine—not for copper—but for the capital of the others supposed by them to be invested in a safe mining business. This last described element in the business has been and is still in public interest the leading one.

Ostensibly the business organization of a great industry into its logical industrial position, the Amalgamated Copper Co., has proven itself really to be nothing more than the business organization of a great gambling device. In a garb of more accepted responsibility and a change of place, the operators of this corporation have differed only by the greater magnitude and boldness of their work from the people who made the same game with the Comstock silver mining as an opportunity. The methods have been the same. The results are if anything more a misfortune. The stimulation of gold and silver mining by the Comstock stock speculation created no competition in metal production, which lowered the natural profit of the business. The stimulation of copper mining has created a competition which is lowering profits and will continue to for a long period of time in advance.

The Amalgamated Copper Co. was organized publicly in the spring of 1899. Privately, the organization started nine months earlier, in May, 1898. Between these two dates the organizers gathered together the stocks of several large producing mines, and where they obtained a majority interest took control through their agents. The consumption of copper was known to be exceeding current production and absorbing the stored surplus. This journal in July, 1896, called attention to the fact that consumption was increasing very rapidly and exceeding production—had very nearly absorbed the surplus. The next move was the raising of the price of copper, a very simple, easy matter at the time and under the conditions. With the time for the advance decided on in November, 1898, it was made an accomplished fact within sixty days afterward. With the public prestige of this accomplished fact the public organization of the Amalgamated was made. The operators constituting themselves the future managers invited the public to supply the money capital.

The managers of the money contributed by the public, they, with the consent of that public, exchanged it for some of their accumulated copper mining stocks—not all of them—taking a money profit of the difference between the price they paid for the stocks in 1898 and the open market price in 1899, when the company was organized.

The price of copper was easily maintained. Time is required to make copper mines—two to three years at the least. The company paid large dividends regularly and the stock became an investment. Stock in copper mines fluctuated greatly. Amalgamated was steady with gradually gaining market

quotations as the feeling of security of investment in it gained with the public. Meanwhile the money released to the managers by the taking over of their stocks was used to extend their stock ownership and control of other mines—notably the Boston & Montana and Butte & Boston—which they had not yet turned in to the company. Withdrawing these stocks from the market the quotations naturally gained. The demand for them could not be supplied outside of the locked-up stock.

In May of this year the next step was taken. The managers exchanged stock for stock this time. Amalgamated was 30% above par. Measured by the apparent earnings the exchange was made on an apparently even basis. No serious attention was paid to the fact that these stocks had appreciated in market quotation very much more than 30%, and that the exchange, owing to the difference in gain, became in fact a change of paper profits for cash profits—the cash of the public that paid in the original capital of the Amalgamated.

The final step has been the realization of these money profits. In the court proceedings in New Jersey the managers of the Amalgamated Co. disclosed their personal holdings of that stock. They were a relatively insignificant per cent of the total capitalization. They were then in on the Boston & Montana and Butte & Boston end of the proposition. The hearing did not disclose how large their personal holdings were in these stocks. When the exchange was made they had only to sell their new certificates of Amalgamated on a market steadied by the \$75,000,000 of actual money contributed by the public to the capital investment in it. This they would appear to have done.

Meanwhile the production of copper had been increasing and a stock had been accumulating. A much greater increase of production was imminent. In the lighting up of the dark ways that attends on misfortune met in them, the public has been seeing with increasing clearness what manner of operation the Amalgamated Copper Co. is.

It may not inaptly be described, as miners will understand it, as a highly respectable faro game, with dealers, bankers, lookouts, cappers, a brace-box, chips to suit all pockets, and the ordinary percentage in favor of the game supplemented by the most effective sure-thing device in the world—Wall street, New York.

The great game is over till the public forgets again. There are still copper mines and there are still copper miners. The latter from watching the game must now turn to watching the mines. Copper at 17 cents meant the operation of many mines that cannot be profitably operated with copper at 12 cents or 10 cents—or it may be less. Other mines must restrict their output by leaving in them the lower grade ores. Both causes will contribute, by checking production, to sustain the price at a balance point where production and consumption become equal. This cannot occur, though, until the surplus is absorbed. A lowered price will, however, clear this last away rapidly by bringing the metal into new uses for which it is now too high priced.

The problem for the miner will be the estimation of where the new price level, after the surplus is out of the way, is going to come. Will it be below or above his cost of production? is the question. Copper mining is no longer the comparatively simple problem of the native copper Lake Superior ores. The bulk of the production comes now from ores in which copper is only one of not less than three metal values, with wide differences in different mines in the respective value ratios. These will make the essential commercial differences. In this connection it must not be overlooked that silver has lost materially in market value, and its future sale price must be estimated on as well as that of copper.

The copper mines that carry gold values are safe to be found the most desirable. In the end, too, the mines that can sustain their own reduction plants will have a considerable economic advantage over mines that depend on custom treatment plants. Finally it can be accepted that the situation is not fully cleared yet, though one uncertain factor has been largely discounted out of it. It would seem improbable that belief in the power of a combination to maintain the copper price far above a natural level, would soon again become the dominant belief of the capital owning public.

Concentrates.

MERCURY is worth \$53 per flask in Denver; \$48 in San Francisco.

NO BONUS has been offered by the U. S. Government at any time for the discovery of tin ore.

SO FAR as known there has been no process discovered for tempering copper that is of commercial use.

THE T-rail used in a long mine tunnel should have a broad, heavy flange to give it a long period of use.

THE tariff on scrap mica is 6 cents per pound and 20% ad valorem. On the sheets when cut and trimmed it is 12 cents and 20%.

IN May, 1899, the Witwatersrand mines, South Africa, produced 466,000 ounces gold; in May, 1900, nothing; in May, 1901, 7478 ounces.

THE "lost mine" industry is not of present profit. Prospectors are too busy finding future values to notice those evanescent myths.

PROBABLY 100 gold dredgers have been built for work in this west half of North America, involving a total outlay of about \$6,000,000.

THE water standing 14 inches deep in a flume 30 inches wide, the end gates 6 inches above the floor, has a discharge of 3 miner's inches per second.

THERE is no market in California for tungsten ore. The Illinois Steel Co., Chicago, Ill., or the Colorado Iron Co., Pueblo, Colo., might be purchasers.

WHERE fireclay can not be had to repair muffles, a mixture of 1 to 2 parts litharge and 10 parts boneash, made into a paste with water, may be substituted.

THE corrosive action of the water in the Stanley mine, Idaho Springs, Colo., is not considered to be due to sulphuric acid in the free state, but to ferric sulphate.

MERCURY CHLORIDE is of rare occurrence. It has been found at New Almaden, Cal., and at Terlingua, Texas, occurring as a white bloom on specimens of ore.

BRIGHTENING will not alone preserve tools from rust. If gone over with an oil rag and put in a box containing whiting, covering them with it, they should be kept from rusting.

FRESHLY PRECIPITATED hydrated ferric oxide acts as a powerful antidote to arsenical poisoning by rendering the arsenic insoluble, both in water and in the secretions of the body.

AS ORES containing gold or silver do not act upon a magnetic needle, no "mineral rod" or "divining rod" electrically impelled will be of any material use in connection therewith.

DETONATING CAPS are about five times longer than percussion caps, and contain from seven to fifteen grains fulminate of mercury. Percussion caps have for filling niter and other ingredients.

IT sometimes occurs that in smelting gold ores containing copper a small amount of copper matte, rich in gold, is produced, a product not suitable for copper smelters, hence sold to lead smelters, where it is treated in the furnace charges as an ore.

THE theft of electric light has been made possible by the insertion of a small paper wedge between the magnet and the registering disk of the electric meter, thus preventing the disk from registering, although not interfering with the supply of current.

THE Southern California Power Co. carries electricity to Los Angeles from a dam on the Santa Ana river near Redlands, Cal., 33,000 volts being carried 81 miles. The plan of the Standard Electric Co. contemplates the transmission of 40,000 volts to San Francisco, Cal., 140 miles.

A COMPOUND MAGNET is made from thin steel magnets, each one carefully and separately magnetized as strong as possible, and then assembled by placing the same poles of all together, the strength being thus made much greater than that of a single magnet of the same weight.

SMOKE prevention is a measure of commercial economy in steam boiler plants. The actual loss of heat by reason of wasted gas which passes away in smoke is but a small per cent of the calorific power of the coal. The waste occasioned by a smoking fire amounts to from 10% to 20% in many plants.

THE Arkansas Supreme Court has ruled that \$100 worth of work had to be performed as the annual assessment work on claims, irrespective of the number of days required to complete the work. The local miners' regulation that twenty days' labor was the assessment work that would hold a claim was invalidated.

WITH 160 revolutions per minute, the engine flywheel, having a maximum rim speed of 5000 feet per minute, should have a diameter of 9.9 feet. The approximate weight in pounds per horse power in rim of wheel would be 36.9; the approximate weight in pounds of the whole wheel per horse power would be 51.6.

NO PRICE can be quoted for "an assay of ore," as everything in that line depends on individual requirements. Prices run from 50 cents to \$10. It is not a matter of competitive bids; better pay a first-class assayer a good price and get accurate results. "Cheap" assays are sometimes very dear. A good assayer can't afford to do "cheap" work. In sending ores for assay it is well to be sure of the samples, and necessary to tell

the assayer for what metal or metals the samples are to be assayed. A sample weighing eight ounces is ordinarily enough. Assaying is an art in itself and the artist earns what he charges.

LODE TIN VEINS in Kuantan, Pahang, Malay, range from 2 to 10 feet in thickness, are from 50 to 2000 feet apart, and trend east and west, underlying both north and south, at angles ranging from 10° to 40° from the vertical. In the district mentioned, about 3000 tons are mined per month, yielding 3½% tin oxide to the ton.

WHERE the location of a mining claim is void because of the absence of a valid discovery of mineral, a subsequent discovery of mineral after the filing of the location certificate, and after all acts of location have been performed, will validate it, if such subsequent discovery is made prior to the attaching of the rights of a third party.

A COPPER MINE at Falun, Sweden, has been worked continuously for 700 years. This ancient mine has yielded 500,000 tons of copper, 15 tons of silver and 1½ tons of gold, representing a value of \$277,500,000. Its greatest production of copper was in 1651, when 3066 tons were produced, and the lowest was in 1883, when 388 tons was the yield.

SPEAKING GENERALLY, amalgamation is slightly aided by heat and as slightly hindered by cold. There are many millmen who favor heating battery water, but the practice is not universally commended. Amalgam, ordinarily, contains more gold in winter than in summer, probably because the warmer water makes more fluid the amalgam. An amalgam that would retort 40% in summer might retort 45% in winter.

MANY mills, run by steam power as a matter of economy in fuel, have adopted the method of heating the water used in the boilers by means of the exhaust steam, using the same water on the plates and concentrating tables. The saving of fuel in some cases amounts to 50%, the water going into the boiler at a temperature of about 90°. By the time it reaches the plates and tables in an open conduit the temperature is reduced to 70° or 80°.

CORUNDUM is found in veins in North Carolina, and in irregular deposits in Chaffee county, Colo. The former averages 15%, the latter 30%, corundum. At Sapphire, N. C., the rock corundum is crushed and ground to No. 12, the sand corundum sluiced from the mine, fed to coarse-punched iron screens, then reground, washed and dried. The average price at the mill is 5 cents per pound, ranging from \$60 to \$200 per ton. The market is limited—fluctuating.

AT various times tin has been reported to exist in different sections of Montana. "Stream tin" has been found on both forks of Clancy creek, in the placer wash, and on their tributaries. The formation there is granite and red shale. In 1876 a bar of tin was run from this ore by H. M. Hill of Clancy and forwarded to the Centennial Exposition at Philadelphia. Tin ore is also found in Meagher county, along many of the streams having their source in the Little Belt range.

A MINING LOCATION can be held by assessment work done for the location on an adjoining claim which is patented. Work which is done in the ordinary business of mining the patented claim will not count as assessment work for the location claim. Where the owner of a location is performing the annual assessment work off of the claim, particular care must be taken that the intent and object of the work is so clearly the location for which it is done that it cannot be questioned.

IN a recent mill test at Hedges, Cal., a back plate which had been in use for several years and against which thousands of tons of ore had been splashed, was melted and assayed. Previous to melting the plate was scraped as at an ordinary clean-up, but not perfectly clean. The assay gave it a value of 25 cents a pound, which was probably all on the surface. To determine this, samples were taken from a cut clear through a similar plate and filed clean. Ten grams dissolved in nitric acid without leaving a trace of gold.

WITH the progress that has been made in the milling of ores, the simple methods now in use and the light cost of constructing a plant as compared with that of a few years ago, advanced miners consider that there is no excuse for permitting "low grades" to go over the dumps or remain standing. Their policy is to fill in the deficiencies of nature, and, where the minerals have been deposited in less than commercial quantity, to remedy it by concentrating to two tons or ten tons, if need be, to get them into commercial form.

WHERE a vein is discovered in driving a tunnel at a point 250 feet below the surface, a valid location of the claim can be made by marking the boundary of the surface at the place at which the vein, if the vein continued to the surface, would be disclosed, though no surface work is done, and no actual tracing of the vein to the surface is attempted, and though the tunnel was not being located under the Tunnel Site Act of Congress, and was driven through patented property, not belonging to the owners of the lode discovered.

THE plan of using the water which has been used on one overshot water wheel on another below it and transmitting the additional power back to the shaft of the first wheel, which is geared direct to the vertical shafts of an arrastra, is practicable, and the simplest way, except by more water being used on the first water wheel, of getting the additional power needed. The two pulleys on the two wheel shafts should be the same diameter if

the wheels are the same diameter, and the wire belt or rope drive should be large enough to transfer the power of the lower wheel to the upper. The power of the upper wheel could be transferred to the lower if desired. It may be more convenient to locate the auxiliary wheel above the one which is loaded with the work.

TO MAKE a valid location of a quartz claim under Section 2320 of the United States Revised Statutes, a vein or lode of quartz or other rock in place bearing gold, silver, cinnabar, lead, tin, copper or other precious metals must be discovered. It is not necessary that the walls of the vein should be within the lines of the discovery shaft. If a vein or lode or other rock in place bearing mineral has not been discovered, then the location is not a valid one. The vein may be very thin or many feet in thickness. The width of the deposit, or whether it is rich or poor, is not material, neither is its regularity.

A MONTANA mine manager writes: "I have the best work on cyaniding in existence. It is a scrapbook made up of practical articles on the cyanide process clipped from the MINING AND SCIENTIFIC PRESS." A California mining engineer writes: "The best and most accurate compendium on building and operation of gold dredgers that I know of is a lot of clippings that I have arranged on that subject from the columns of the MINING AND SCIENTIFIC PRESS." A Colorado mine superintendent writes: "I know of no better work on concentration than that I have secured by selecting some of the many admirable articles on ore concentration in the MINING AND SCIENTIFIC PRESS."

IN CALIFORNIA, under State statute of April 23, 1880, it is not lawful for the directors of a mining corporation to sell, lease or mortgage all or any part of the mining ground of the corporation, unless such act be ratified by the holders of two-thirds or more of the capital stock. Where less than a legal quorum authorized the giving of a mortgage on the mining ground of the corporation, which was held invalid, but which act was confirmed by two-thirds of the stockholders, it has been decided that the statute did not confer on the stockholders the power to validate an invalid act of the directors, nor could they, without the board of directors having first lawfully acted, give a mortgage on the corporate property.

THE owner of a quartz claim is not confined to one shaft for a discovery. If he has not what proves to be a valuable discovery where he supposed it to be, in his discovery shaft, but makes a good and unquestionable one outside, he can hold his claim and patent it. A claim cannot be legally held without a discovery of a vein or lode of quartz or other rock in place bearing some mineral. The United States mining law distinctly declares that "no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located." If the claimant has no legal right to the ground by virtue of a valid discovery and a proper location and record of it, then he has no right to a patent for it.

REGARDING stopping a lense down to ⅛ inch, it depends upon the size of the plate to be covered, as the amateur stopping a lense down as much (and trying to take instantaneous views) will not meet with success. In photographing mines and mills, a short-focus, wide-angle lense is necessary, as there is not the distance necessary to use a long-focus lense without sacrificing much of the picture. Celluloid films rarely give the results that can be obtained with dry plates. In photographing mines where the light is poor, it is necessary to use the flashlight. Better results will be obtained by giving two flashes, one at each side of the camera, as it will do away with the heavy shadows which result when only one flash is used. In photographing machinery where some part is wanted to show particularly, by whitewashing the same, the finest detail will be preserved.

SOME ASSAYERS say that as between "pot" and scorification assays the latter are more satisfactory, claiming that in scorification there is less slag absorption, cupel absorption or volatilization. While scorification in muffles is a tedious process, scorifying the sample in a small wide-mouthed crucible in a Cornish fire, with heat and draught properly regulated, is reported entirely satisfactory. To about three grams of ore are mixed in twenty-five grams granulated assay lead and a small quantity of a flux composed of equal weights of carbonate of soda and borax. Subsequently another quantity of twenty-five grams granulated lead put in is covered with a further quantity of flux, the crucibles then placed in a full fire at a low heat, when melted the bricks being opened, the damper raised, causing a current of air that occasions rapid oxidation and a thorough scorification.

A ROUGH AND READY WAY of separating and refining gold and silver in an impure slug or little bar containing gold, silver and copper is to melt it and pour it into cold water, causing granulation. The grains having been panned out from the slag are to be dissolved in concentrated C. P. sulphuric acid of 65° density, this being best done in a glass beaker, the gold remaining as a black undissolved powder, the silver and copper going into solution, which is to be poured into a glass vessel in which are packed isolated copper strips, the silver being precipitated as a white powder on the copper, susceptible of being brushed off and fused into a button. The remaining solution, when poured into a glass vessel containing bright wire nails, will give a copper precipitation in the form of bright red powder. In each of the three cases the resultant powder is carefully collected, washed three times and as carefully dried before final melting.

A Novel Method of Tunnel Building.*

By HOWARD A. CARSON.

The Metropolitan Sewerage Commission of Boston, Mass., in carrying out their plans for the disposal of the sewerage of the large district surrounding the city of Boston, has been compelled to build a number of submarine tunnels, crossing rivers and straits and finally out into the open sea, from Deer Island, at the entrance to Boston harbor. None of the tunnels had to be very deep beneath the water surface, so that it became possible to experiment with novel methods of construction.

One method employed a coffer dam and pumping plant. The coffer dam consisted of piling and sheet piling around a small section of the line. After the dam was made it was pumped out and kept free of water while a trench was excavated and the sewer tunnel built of brick and concrete in the trench. This method of construction cost as high as \$90 a foot. The increasing difficulties that were encountered in constructing from Deer Island out into the open sea ultimately forced the abandonment of this plan.

In the crossing of Shirley Gut, which separates Deer Island from the main land, the coffer dam method had not been practicable owing to the strong tides. The method used there had been to build the sewer or tunnel in sections of brickwork lining encased in thin steel shells. These sections were built on ways, as shown in the illustration, the ends were bulkheaded, they were then launched, towed to place, submerged by admitting water and joined together by divers. Finally

water. They were partly hoisted and partly pulled off the rollers, blocking the rails on the second following high tide, and were then towed to the proper position to place in the siphon.

The pipe sections for the outlet—southerly end of Deer Island—were made in "cradles" at the sides of a wharf, illustrated on the front page. These cradles were each made strong enough to hold the pipe sections, 52 feet long, and weighing upwards of 210,000 pounds. These cradles could be lowered by machinery at will and thus place the finished pipe in the water, where it could be towed to the outlet, distant between one-half and three-fourths of a mile.

CHARACTER OF EXCAVATED MATERIAL.—Sand and gravel, with stratum of black mud mixed with sand.

Cost of dredging \$12,050 00
Cost of dredging per linear foot 13 40

PILE WORK IN TRENCH.

Cost for piles and labor \$3,400 00
Cost for caps and bolts 200 00

SILLS.

Cost of labor and materials \$840 00
Cost per linear foot for same 94

CRADLES FOR BUILDING PIPE SECTIONS.

Cost of piles and labor on same \$600 00
Cost of materials and equipments 1,800 00
Cost of labor 1,300 00

PIPE SECTIONS.

CHARACTER OF STRUCTURE.—Masonry pipes encased in wood lagging securely hooped. These laid in sections and bolted together by divers.

Description of a single pipe:—

Length 52 feet.

timber and concrete (to sink it) which fitted the pipe. Sills were blocked up and tamped until they were perfectly solid and had a firm bearing.

VERTICAL GUIDES.—To insure that the pipes should be lowered exactly into these cradles, vertical guides of T rails were placed with one end fitting into mortises in the sill.

CONSTRUCTION OF PIPES.—The pipes were built in cradles located at the new wharf, about $\frac{1}{2}$ mile from the trench where they were laid.

Thirteen strong ribs, each having a built-up semi-circle of 9 feet $3\frac{1}{2}$ inches diameter, each rib supported at each end by a $1\frac{1}{2}$ -inch steel rod, with thread which fitted a 12-inch diameter cast gear nut. Four-inch spruce lagging, 6 inches wide, was laid up to springing line and bolted to a steel angle hoop at each end of the pipe. These angle hoops were used to bolt together continuous sections of the pipes when laid. The shell of concrete was 6 inches thick and mixed with volumes as follows: Cement, 1; sand, $1\frac{1}{2}$; beach gravel, $3\frac{1}{2}$. The brick shell was 3 inches thick, and the inner ring was left toothed for making connections with adjoining pipes. After the pipes were braced internally 6 feet apart by both vertical and horizontal 4x6-inch braces, bearing on 4x6-inch stringers running longitudinally, the bulkheads were put in. The bulkheads were of 6-inch spruce, caulked and secured by 1-inch iron rods to vertical 6x8-inch posts built into the brickwork about 8 feet from each end of the pipe. The bulkheads were inside the concrete layer of the pipe, and were drawn against the brickwork by the iron rods. In the forward end of each section of sewer pipes two 2-inch wrought iron pipes, to be used later to let in water, were placed so as to extend quite through the entire bulkhead. These pipes were plugged from the inside, when first made, with pine. After a masonry pipe section was sealed up it was examined for tightness by partially exhausting the air. The least perfect vacuum recorded on any pipe was 6 inches of mercury; the best was $13\frac{1}{2}$ inches. A pipe was used to allow air to escape when letting in water to sink the pipes. The pipe as thus completed was painted with asphalt to protect the wood from limboria and teredo before it could be covered in the trench with earth. A rubber gasket 1 inch thick and $2\frac{1}{2}$ inches wide, having an exterior diameter of 8 feet $5\frac{1}{2}$ inches, was then fastened to the end of the pipe by nailing it to the wooden shell. The pipe was then ready for launching.

LAUNCHING.—The pipes were launched by lowering the pipes and cradles into the water at high tide. After the pipe was about two-thirds submerged, rafts made of oil barrels, having a floating capacity of 5000 pounds each, were attached to the ends of the pipe section. The attachments were made near the top of the pipe, in order to keep it while floating in the same position as while being built. When the pipe and rafts had been submerged until the top of the pipe was about 1 foot above the surface of the water, it floated from the cradle. The pipe was then pulled out of the cradle and was ready for towing. About $1\frac{1}{2}$ hours were consumed in removing and lowering a pipe from the cradle, and about twenty minutes were necessary to raise the cradle into position ready for making a new pipe. A towboat was used to take the pipe to the trench prepared for it.

LOWERING PIPES INTO POSITION AT THE OUTFALL.—This was done by a system of traveling shears running on the temporary pile work. The operation is illustrated on the front page. To control the pipe while being lowered and to insure its proper placing, vertical guides, previously described, were used to prevent lateral movement, and check ropes to prevent endwise movement were used. Each pipe was lowered about 6 inches from the end of the section previously laid. To bring the pipe back against the previous section, a windlass was placed about 50 feet back, from which a rope led to the pipe. Telltales were rigged so as to show if the pipe varied from a horizontal position as it went down. Everything being ready, the diver opened the two 2-inch holes in the end of the pipe by driving the pine plugs inward. At the same time the 1-inch test pipe at the top of the section was opened to allow air to escape. In about four minutes the pipe had received water enough to sink it, and the diver plugged the 2-inch holes, this time from the outside. The small test pipe was also closed. Just before the pipes rested on the sills, the winch behind was used to pull the pipe section back to the preceding one; after which the pipe was adjusted exactly to line and grade. The pipe section was then bolted to the preceding section by forty hookbolts. The joint between the two pipes was made perfectly tight by means of the rubber gasket.

COMPLETION OF THE INTERIOR OF PIPES.—As fast as the pipes are laid and back filled, the end bulkheads are removed, the water used in sinking pumped out and the masonry completed. Several pipes, however, intervene between the outermost one and that in which bulkheads are being removed. But one joint was found to leak, and that no more than would come through a $\frac{1}{8}$ -inch hole with 25 feet head. The leak was easily stopped.

All material was removed from and brought into the sewer by means of a manhole on shore.

Light was furnished for work inside the sections by a Westinghouse dynamo.

[The novel construction that is described in the

Bulkhead Construction in Submerged Tunnel Siphon, Shirley Gut Crossing, Boston Harbor, Mass.

the bulkheads were taken out, making a clear open way.

It was decided to make use of a method somewhat similar to that adopted for the Shirley Gut crossing, to complete the seaward extension of the Deer Island terminal that could not be built by the coffer dam method. It was thought that if for the steel used for shells in the Shirley Gut work there could be substituted wood, the sections, when sunk in the harbor and covered with earth, would last much longer, would cost considerably less and have other advantages.

It may be stated, however, that neither the steel nor wooden shells are necessary for the permanency of either of these works. Experiments were made by Assistant Engineer William W. Lewis to test the points above mentioned. The strength to resist bursting pressure of oak hoops joined with copper rivets was determined. A pipe about 16 feet long, with an external diameter of 5 feet 2 inches, made of 2x4-inch spruce lagging, with an inner shell of Portland concrete masonry 8 inches thick, with an interior clear diameter of 3 feet 6 inches, was made at Chelsea creek and bulkheaded. It was found that a vacuum of 14.5 inches was very quickly and easily obtained, showing it to be watertight. As a result of the studies and experiments, the design of pipe and method of constructing and laying it, here described, was decided on.

Another marked difference in the method of construction of the outlet sewer and that of the Shirley Gut siphon will be noticed. In the Shirley Gut siphon the pipe sections were made on the beach, a little above high water, and were launched by moving them down the beach on rails, rollers and blocking at low

Greatest diameter (outside) 10 feet $1\frac{1}{2}$ inches.
Thickness of brickwork 8 inches.
Thickness of concrete 6 inches.
Thickness of spruce lagging 4 inches.
Hoops (white oak) 4 inches by $\frac{3}{4}$ inch.
Total thickness of pipe 18 inches.
Internal diameter 6 feet $3\frac{1}{2}$ inches.
Weight of pipe in air 210,000 pounds.

COST OF BUILDING PIPE SECTIONS.

Approximate cost per linear foot of pipe \$24 70
Approximate cost per cubic yard of brickwork 11 70
Approximate cost per cubic yard of concrete 8 40

Approximate cost per linear foot of excavation, masonry and wooden shell, including labor, material, pile foundation and miscellaneous expenses \$54 15

Because of the strong tidal current across the trench, it was necessary to construct a temporary breakwater. This was parallel to, and located at first 75 feet and later 100 feet from, the center line of trench on the east side. It was built by driving piles 8 feet apart, covering these longitudinally with 4-inch planking up to half tide, and filling dredged material on both sides. After the trench for the sewer was dredged, piles (45 feet) were driven in bents of two, there being five bents for each 52 feet length of pipe. Three bents of the five were spurs. These bents were capped at elevation 114 with 4x10-inch spruce girder caps, upon which stringers were laid to carry the lowering apparatus.

SILLS.—Sills were made as follows and secured to the bents of the piles by bolting: They consisted of 8x8-inch spruce which lay on top of a box of concrete. The box of concrete was fastened to the sill and was used to cause the sills to sink. Such a sill, when sunk, could easily be handled by the diver. The two end sills for each pipe had a circular cradle made of

* Condensed from Report of Metropolitan Sewerage Commission of Boston, Mass.

preceding has special interest from the application of similar constructions, the difference being differences of detail merely, to provide large volumes of water for power and milling plants from lakes and stream waters that freeze over in winter. Incidentally, a water supply free of mechanical impurities is obtained by taking it farther away from the shore. Several of the lately constructed power and milling plants of the Lake Superior copper mines have installed submerged tunnel conduits for this purpose. The large electric power plant of the Metropolitan Street Railway Co. at New York has such a tunnel 12 feet in diameter, extending out into East river, to supply condenser water.—Ed.]

Mountain Roads.*

NUMBER III.—CONCLUDED.

By JAMES W. ABBOTT.

THE BEST PRACTICE IN CURVES.—The minimum curve allowable on mountain roads has the arc of a circle with a 30-foot radius for its outer edge. All sharp curves and their approaches from each direction should be level. This principle, of such great importance to the efficiency of mountain roads, is generally either not understood or ignored. A moment's reflection will convince anyone that safety demands it, and that on such sharp curves a four-horse or six-horse team, to pull its maximum load, must not have any impediment from grade, as the wheel horse does most of the pulling.

All curves on steep grades should be equated (the grade lightened) and the roadbed widened. No universal rule for this can be laid down, but the best practice demands it and good judgment in locating always considers it.

Where a road winds backward and forward up a hill in approximately parallel lines, the turns are called switchbacks. They are expensive and very undesirable. Where possible, they should be avoided, but when indispensable they come under the rule above laid down for minimum curvature and freedom from grade.

Wherever a bridge is approached by a curve its end should be flaring and the roadbed made wide and level. Curved approaches to bridges are, of course, very undesirable and should be avoided, if practicable.

STAKING OUT THE ROAD LINE.—Staking out of the road line must be done by a surveyor, with a transit and target rod, set each time at the height of the instrument (horizontal axis of the telescope). All grades can be determined with sufficient accuracy for wagon roads by angles of elevation from the horizontal. These angles are obtained from any table of tangents. An angle of elevation of 1 degree and 9 minutes gives a 2% slope; an angle of 2 degrees 52 minutes a 5% slope; an angle of 4 degrees 35 minutes an 8% slope; an angle of 5 degrees 43 minutes a 10% slope, and an angle of 6 degrees 51 minutes a 12% slope. An Abney level—also called a pocket altimeter—is a very valuable instrument in laying out a road line. With it one can make a preliminary reconnaissance without being burdened with a transit.

On sidehill grades we stake the outside of the cut at grade. Slope stakes must be set to determine where the inside line of the cut begins. These can be set with sufficient accuracy with a 12-foot straight-edge, a clinometer and a taping. An Abney level and a taping are better still. The surveyor can make himself a little table, which will show the distance from his eye to the foot of the slope stake for each five minutes difference in elevation registered by his Abney level for the various widths of cut to be used—one table for rock cuts and one for picking or plowing ground.

DETAILS OF CONSTRUCTION.—In constructing mountain roads a sidehill plow with reversible share is a *sine qua non*. The writer has seen six strong mules and four men working hard to run a furrow up hill, when two animals, attached tandem to a sidehill plow, and two men, could have done more work and with much greater ease. It is astonishing how rapidly a sidehill grade can be constructed with such a plow and a scraper. When the two lines of stakes are in—grade and slope stakes—you start right and you come out right. Your inside bank has the right batter and your road the full width you meant it to have. It is very common to see a contractor on a mountain road, who attempts to grade without slope stakes, find his roadbed too narrow. It is too late for him to use his plow, and he must widen out with pick and shovel, the last operation costing, perhaps, as much as the entire grading should have done if done rightly from the start.

SLIDE ROCK.—In the mountains we often find the hillside slopes covered with broken stone of various sizes. This we call slide rock. This slide rock may be very coarse and the surface extremely ragged, when it is called "heavy slide." It may be fine and bound together by soil, in which case it can be plowed. It may be fine and dry and run just like dry

sand when one attempts to walk on it or otherwise disturb it; this is called "fine slide rock." To construct a road in coarse slide we build a retaining wall on the outside of the grade of large rocks weighing not less than seventy-five pounds each. We then shape our roadbed, making it as smooth as possible with the material at hand, and cover this surface with fine slide. All rock retaining walls for mountain roads, when laid out dry should have a batter of one horizontal to two vertical. They should only be used where the filling behind them is coarse rock. If used to hold loose material with a batter of one to two, they may be gradually crowded out and the bank give away. If made less steep than one horizontal to two vertical to hold loose material, the method is too expensive to be ordinarily practicable. Coarse and rough and discouraging as heavy slide may look, the very best results may be obtained in it if the entire process is accomplished carefully and conscientiously. It furnishes an absolutely solid, perfectly drained road foundation, is unaffected by the elements, and requires less outlay for repairs than any other variety of mountain road.

Probably the most perplexing material which the inexperienced road builder encounters in building a road is fine slide rock. It appears to be so utterly unstable in every way that he does not know how to attack it, and it seems impossible to obtain either definite or satisfactory results. He can not plow or scrape it. Neither he nor his animals can keep their footing in it. Fortunately, patches of slide rock are never very long, and while the process of making a road across it is tedious and somewhat expensive, it can always be successfully accomplished.

The following instructions carefully observed will always yield satisfactory and gratifying results:

Stake out the grade line, setting the stakes about 25 feet apart and driving them down as firmly as possible. They will stay in place for a time if put in deeply enough. Slope stakes in fine slide rock are useless. As it always stands at about the same slope (35 degrees), the process is very uniform.

For a single track, put up another row of stakes vertically 7 feet below the grade stakes; for a double track, 10 feet vertically below. These lower stakes determine the foot of the cribbing which must hold the road. It is thus constructed: The logs should never be less than 10 inches in diameter at the small end, and the larger the better. The crosspieces should be uniformly 8 inches in diameter. That kind of available wood should be selected which experience has shown will rot most slowly, and all bark must be carefully removed. The logs need not be of any definite length, but the courses should always break joints. Now, beginning at the lower row of stakes with pick and shovel, make a bench, and on its outside edge carefully bed the bottom log. Then dig into the bank and bed each crosspiece. These should be 5 feet apart from center to center, with cross notches to fit triangular edges in the logs, just as house logs are fitted together. This notching should be done with much care to permit the logs to just touch, so that the crosspieces may be weakened as little as possible. The proper length for these crosspieces is 8 feet. They should never be bedded level, but always with a downward slope into the bank. With time and patience the lower row can be properly bedded and a good foundation for the cribbing secured. A dozen pointed inch steel bars driven in a row 3 inches apart, sloping into the bank, will help materially to hold back the slide while digging to bed crosspieces. Proceed to build up the cribbing, filling in with slide as the work progresses, remembering that the batter of the structure should be one to four.

When grade line is reached, there will be a 10-foot roadbed for single track and 16 for double track, fairly solid on the start and rapidly compacting with travel. Consolidation will be effected by a light dressing of some fine clayey material, if accessible, but this is not indispensable. Every road across fine slide must have careful attention. For all time fine slide will run down onto the roadbed, and it must be shoveled out occasionally, but this will not be a serious item of cost; in other ways the roadbed will be very satisfactory. It has natural drainage, the best of material is always at hand to fill ruts and chuck holes, and a hard, even surface can be maintained. The road grows a little wider each year. Cribbing thus constructed will last many years, and when it does finally give out, it will be found that a substantial foundation for the new road can be obtained without going nearly as deep as at first.

CORRUROY.—In laying out mountain roads we often encounter a spongy soil filled with water, especially above timber line. This almost invariably proves to be shallow with a substratum of good road material. This surface soil must be removed and a system of drainage adopted to keep surface water from running onto the roadbed. Occasionally corduroy is economical to meet such conditions, but it is a very undesirable expedient, and should be adopted only in extreme cases.

As in cribbing, all corduroy material should be the most durable to be obtained and the bark removed. The stringers should be not less than 10 inches in diameter, 30 inches apart from center to center, carefully bedded to an approximate level, and their tops adjusted for uniform contact with the covering

by the use of a long straightedge and adz. A row of 2-inch planking on each side, thoroughly secured by long spikes to each crosspiece, will prevent its rolling. If a crosspiece is occasionally bolted to its outside stringers, there will be no creeping. Lines should be carefully hewed for wheel and horse tracks. This is often overlooked, and corduroy then becomes an unbearable nuisance. Another mistake often made with corduroy is getting it too narrow. It ought never to be less than 12 feet wide for single track and 18 feet for double track.

A thorough system of both cross and longitudinal drainage must be adopted to protect the corduroy from quickly rotting and to keep its foundation from settling unevenly.

Rollers can rarely be used to advantage on ordinary mountain road grades, which, if properly constructed, will soon pack hard under the wheels of heavy teams. If wide tires were required by law, roads would be protected, heavier loads could be hauled, and expenses of maintenance and operation much reduced.

DRESSING.—All mountains are made of rock, the soil with which they are in places covered being merely a product of rock decomposition and water concentration. We can generally find a rock dressing prepared by nature within convenient distance of a mountain road. We sometimes find a complete material in one place and sometimes get better results by mixing two kinds. A hard rock in angular fragments makes an excellent road covering if we put some suitable fine material on top of it. Two inches is the maximum diameter allowable for any piece of road-covering material. Where the fragments are larger, it should be screened. Sometimes it is best to mix two kinds of rock, one hard and durable and the other disintegrating more rapidly through wear and chemical decomposition. Nothing ever takes the place of a rock covering for roads. It can always be cheaply obtained in a mountain country. If nature does not furnish a suitable preparation of it within economical distance, it can be cheaply prepared. Nearly any mountain county can secure a portable crushing outfit for not to exceed \$500, and can find material to use it on within convenient hauling distance of any road.

Most mountain roads at first require dressing only in stretches, and later for repairing holes and ruts and for maintaining a suitable inward slope. A covering of 3 inches is ample for a beginning. Six hundred tons of rock dressing will completely cover a full mile of single-track road, and on the average mountain road that amount would be sufficient for 2 miles.

If a road surface is to wear evenly, it should be homogenous—that is, it should not be built or repaired in spots with different kinds of materials; a clay road should not be patched with gravel nor a gravel road with clay. Whenever holes or ruts occur these depressions should be filled with material of the same kind as constitutes the road surface. Detritus, resulting from traffic, which is washed by rains into the gutters, should not be placed back upon the surface, for it has lost its power of cementation; it should be thrown away and replaced by fresh material. No perishable material of any description, under ordinary circumstances, should be permitted upon the roadbed, sod being particularly objectionable.

The Fire Test for Ores.

In the process of ascertaining the value of a piece of mineral-bearing rock the ore is first pulverized in a crusher or mortar. It is then quartered or split, until a sample is obtained small enough for convenient handling. A split is a series of troughs alternating with a series of slits equal in number and size to the troughs. Half of the sample is retained in the troughs every time the ore is passed through the slit. This process is continued until the quantity is sufficiently reduced. The sample thus obtained is spread upon a bucking-board, a metal plate fastened upon a firm foundation. It is then reduced to a powder by rolling it with a muller, which is a heavy iron sledge with a smooth convex surface. The sample is usually pulverized until it will pass through a 60-mesh sieve. In this condition the ore is called pulp.

The assayer uses weights, which are proportioned to the commercial weights, an assay ton, consisting of 29,166 grams, representing a ton of ore. The result of the assay is weighed in milligrams. If an assay ton of the pulp is used, each milligram in the result represents an ounce of the precious metal to the ton. Usually half an assay ton of the pulp is used, and the result is then multiplied by two to get the number of ounces to the ton.

A half assay ton of the pulp is weighed carefully on the pulp scales and put into a crucible, together with a flux, which consists of carbonate of soda, borax and litharge, or protoxide of lead. Sometimes flour is added. The proportions of the ingredients in the flux vary according to the nature of the ore. Some heavy lead or galena ores require very little litharge. Other ores which contain little or no lead require litharge in larger quantities. The pulp and the flux are thoroughly mixed and covered with salt or borax. Borax makes a clearer flux, but has no other advantage over the common salt. If there is an excess of sulphur in the ore, iron nails are added. The cru-

* From Year Book U. S. Department of Agriculture for 1900.

cible is then placed in the furnace, which has been heated to white heat to receive it.

The furnace contains a fireclay oven, a muffle, which is made with an opening at the back to permit the fumes from the crucibles to escape. Usually half an hour or forty minutes is required to reduce the contents of the crucible to a fluid state. When the action in the crucible has ceased the contents are poured into a metal mould and allowed to cool. The slag is then broken off and a lead button is found at the bottom of the mould. This lead button contains all the gold and silver in the ore. To separate the gold and silver from the lead, the button is placed in a cupel, a small dish made of boneash, and replaced in the muffle. The lead is melted, and part of it passes off in fumes, while part of it is absorbed, together with any copper or other substances which may be in the bottom, by the boneash, leaving a small silver button in the cupel. If the ore is known to contain much silver, the lead button is placed in the cupel just as it is taken from the slag; but if there is very little silver in the ore, a known quantity of pure silver is added, so that there may be a heavy excess of silver in the button obtained in the cupel. This is necessary in order that the button may be parted with acid.

The silver button is weighed on the button balance, and is then parted by immersing it in nitric acid. The acid dissolves the silver and leaves the gold in the form of fine black dust. The parting is done in an annealing cup. The gold is washed and dried and the cup is placed in the muffle and heated to a red heat, which anneals the gold, bringing it into a compact mass and giving it its true gold color. The gold is transferred to the tray on the button balance and weighed. The weight of the gold is deducted from the weight of the silver button, giving the weight of the silver. The button balance is a delicate piece of mechanism. It is kept in a glass case and the weighing is done with the case closed, in order that the air currents in the room may not affect the beam.

The Pachuca Stamp Battery and Its Predecessors.*

The invention of the arrastra for fine grinding is declared by some authorities to have been made by Bartolomeo de Medina, at Pachuca, Mexico, about A. D. 1557, which is quite probable. Being the first to amalgamate silver on anything like a commercial scale, he must have felt the necessity for ore-grinding apparatus of greater capacity than the old primitive millstones, and the arrastra was thus the natural successor of the millstone. It is very unfortunate that the archives of Pachuca, which have made so much history in ore treatment, were destroyed in some one of the many insurrections for which, also, the place is renowned.

The first application of the stamp to the crushing of rock is asserted by some writers to have been the invention of a Saxon nobleman named Von Maltitz, about the year 1505. Better authenticated reference, however, is made to one Paul Gronstetter, a native of Schwarz, and called an ingenious worker, who, in the year 1519, established at Joachimsthal a process of wet stamping and sifting. Whether the stamp mill was then practically used as we find it profusely illustrated in the work of Geo. Agricola, some years later, or whether it had been further developed by other hands in the interim, we are not informed. But for more than 300 years the stamp continued to be a square timber (except in a few instances, where square iron was used) with an iron shoe at the lower end. In this form it came to crush the first gold ore of California.

After outlining the development of the stamp mill in California, the paper says that sixteen years ago the writer became an advocate of concrete foundations and low-set guides for stamps, and three years later took the opportunity to apply these principles to the original Hacienda de San Francisco of Pachuca.

This first foundation, however, was not an unqualified success, the concrete having been insufficiently rammed; but it was a guiding star for the erection of the new Hacienda de San Francisco, built at Zotol. This mill began crushing ore in May, 1894, has been in practically constant operation ever since and has made a record in some respects very remarkable. It was built with twenty stamps, and in the following year was increased to thirty stamps. During these seven years only four stems, all told, have been broken and one renewed, and the stems are not seriously worn in the guides. The stamps, when new, weigh 1040 pounds each, and make 102 drops per minute. Each stamp has therefore dropped about 450,000,000 times, without renewal of stem or guide. For this result three causes are assigned:

1. The long stamp head and low guide prevent severe wrench to the stem when the stamp strikes hard at one edge of the shoe.
 2. The solidity of the concrete foundations keeps the jar and vibration of the iron work at a minimum.
 3. The iron guides give the stem but little play.
- At the Hacienda de San Francisco, now running, the concrete was laid upon solid bedrock, and was 9 feet in depth and 9 feet in width. It was very thoroughly rammed as laid. On a hard bedrock there is

no necessity for deep concrete, except to secure the required height—in fact, no foundation could be better than a solid, unfailing granite bedrock, with only a thin sheet of rubber or canvas between it and the mortar. With a mortar having a fairly thick bottom, this would make a perfect anvil for the blows of the stamps. The top of the stamp head in the San Francisco is only 2 inches below the lower guide when the stamp has new shoe and die, and is raised 6 inches for drop. This, of course, requires that the housing shall be around the stamp head instead of around the stem, which is easily effected with a long stamp head.

Guides of iron themselves wear so little and also wear the stem so much less than wooden guides that they are beyond comparison better. For example, how thick would a stem be, after running seven years in wooden guides, without repairs or alteration in length? The reason that wooden guides wear the stem so much faster than iron ones is that they accumulate grit, whereas an iron guide becomes smooth and polished.

A New Mineral.

The identification of a new mineral is reported by Dr. A. O. Ingalls of Alameda, Cal. He describes it as follows:

Provisional characteristics—Crystals, isometric (?), cubic, often tabular; granular; disseminated through the matrix.

Fracture—Uneven. Cleavage—Cubic, indistinct, brittle.

Color—Brass yellow, inclining to reddish yellow.

Streak—Blackish, iron black.

Luster—Metallic.

H=4. G=4.5 (?)

Open tube, faint sublimate TeO. Very rarely sulphur fumes.

Closed tube, faint sublimate TeO. Selenium, very rarely sulphur.

On coal—Fuses to semi-metallic globules selenium ring.

With potash cyanide, tin with spurting; with soda and borax, tin.

Soluble in NO₂ with decomposition and evolution, at first of NO₂, then selenium, forming a green solution.

Essentially Sn, and Se, or a selenide of tin. Some samples contain traces of copper, zinc and sulphur; but these are not to be considered essential, but accidental, as will be seen when its origin and association is considered.

This mineral may be considered as somewhat related to stannite, in which the sulphur is replaced by selenium and the copper and iron eliminated, the pure mineral being free from copper, iron, zinc or sulphur.

No quantitative ultimate analysis has been made.

Association—The mineral occurs in cubic crystals and granulations disseminated through a matrix of quartz and chlorite. Muscovite mica is usually present, with the chlorite often entirely replacing it, and from lithological characters the mica should be the association with quartz. This matrix also often carries an amorphous form of silicate of tin. This mineral is intimately associated with zinc, usually in the form of a silicate, often an oxide. No blende has been observed. A portion of this vein will consist entirely of the zinc.

This vein of mica-quartz schist, in which the mineral has been found, cuts a peculiar form of granite where, very often, the constituents are more or less completely separated, the hornblende in distinct crystals being at places the character, then the quartz will be entirely separated, and from these extremes the rock passes to a true granite. At places there is a true syenite, and in many places the serpentine series are lying against the granite.

The character of the mineral was examined in the field, and hence the characteristics are subject to correction.

The type is deposited in the cabinet of the State Mineralogist at San Francisco, Cal.

The scale of Baume's hydrometer or specific gravity measurer for fluids starts 10° lower than unity or water, thus:

| Degrees
Baume. | Specific Gravity. | Weight.
Gallon.
Pounds. |
|----------------------------------|-------------------|-------------------------------|
| 10 equals.....1 (water) weighing | | 8.33 |
| 20 "0.9333 | " | 7.78 |
| 30 "0.8750 | " | 7.29 |
| 40 "0.8235 | " | 6.86 |
| 50 "0.7777 | " | 6.48 |
| 100 "0.6086 | " | 5.22 |

THE most important quicksilver-producing districts in Mexico are Guadalcázar and Huitzuco, in the State of Guerrero. In the former locality it occurs in calcareous rocks of the Cretaceous age, where it forms veins and impregnations; the age of the formation and nature of the deposits being similar to those in California. In 1894 the Guadalcázar district produced about 25,000 flasks and Huitzuco about 5000 flasks—these two districts producing 260 of the 268 metric tons in Mexico in that year. The production for 1900 amounted to 335 metric tons.

A Standard Assay Certificate Form.

Written for the MINING AND SCIENTIFIC PRESS.

In the MINING AND SCIENTIFIC PRESS of September 14, 1901, suggestions were invited as to a proposed general blank certificate form for assay returns, that could receive such general acceptance that it could become a standard. The writer had long appreciated the deficiencies of the forms of assay return certificates employed. While satisfactory enough to the smelters and ore buyers, the assay return figures that they provided for could be misleading to prospectors, by reason of not stating the net commercial values. Used to formulate opinions or plan schemes of metallurgical treatment, engineers and experts would find it necessary to first make more or less computation to make the returns available. For example, one assayer would make a return on a sample reading as follows:

| | |
|----------------------|---------|
| Gold, .14 oz. | \$ 2.89 |
| Silver, 1.8 oz. | .97 |
| Copper, 4.8% | 15.96 |
| Total | \$19.82 |

Another assayer would make a return on the same ore reading as follows:

| | |
|----------------------|---------|
| Gold, .14 oz. | \$ 2.80 |
| Silver, 1.8 oz. | 1.08 |
| Copper, 4.8% | 10.68 |
| Total | \$14.56 |

Then it might be the prospector would conclude to have a mill test, as he would term it, made. A ton would be shipped to a smelter and the returns certificate that would be received would read something like the following:

| | |
|----------------------------------|---------|
| "Gold, .14 oz. | \$ 2.52 |
| Silver, 1.8 oz., less 1 oz. | .39 |
| Copper, 4.8%, less 1.3% | 7.78 |
| Total | \$10.69 |

LESS.

| | |
|-------------------------|----------------|
| Treatment charges | \$8.00 |
| Freight advanced | \$4.50—\$12.50 |

"The returns of your ore do not meet the freight charges advanced by us and our treatment charges. Please remit \$1.81 to balance."

All three of these returns show precisely the same quantities of the three metals in the ore. Each assayer, however, has had his own rule for determining and stating values. The first estimates gold at \$20.67 an ounce, its full mint value; silver at 54 cents an ounce, because silver was worth 54 cents an ounce on the day the assay was made, and copper at 16½ cents a pound, the selling price in New York. The second assayer estimates his gold at the smelter value of \$20 an ounce; silver at 60 cents an ounce, because his tables are prepared for that value, and copper at 11½ cents, being 5½ cents less than the New York quotation of 16½ cents, because the nearest custom smelter makes that deduction. The third—the smelter—values the gold at \$20 an ounce, but pays for only 90% of it; it values the silver at 64 cents, the New York market price the day of the assay, but deducts one ounce from the quantity and pays for 90% of what remains, and it values the copper at 16½ cents, the New York market price, deducting first from the quantity 1.3% to cover slag losses, and second 5½ cents a pound from the price, to cover the cost of refining, freight and marketing. Finally it charges up against the total values a deduction for treatment and freight advanced, thus making the settling value a negative quantity. Of the three, the first gave the theoretical values, which could be directly employed in devising the most economical treatment scheme for the ore. The third gives the immediately realizable commercial value. The second was a compromise, and really told nothing exactly, not even the gross commercial values that it pretended to. The engineer would have to compute from it the theoretical values for his starting point, and the prospector would have to compute it from the real commercial values so as to arrive at his finishing point without actually shipping to the smelter.

There is no reason why assay returns should be fictions. There are very many good reasons why the assay return certificates should directly state the facts of value that it was the object of the assay to determine. All the facts are better than part of them. The work of their ascertainment is purely mechanical. They can be obtained by the use of simple arithmetic. The assayer is very properly the person to estimate both the precise theoretical and commercially realizable values of the ore he assays.

The form the writer submits has been prepared by him to satisfy the requirements both of the metallurgist and engineer, and of the miner. In arranging it one of the ideas given consideration was to have it occupy such a space that it could be printed on the same size legal cap sheet employed for typewriting mining reports. The size is that of the blank form accompanying this. It can be bound in with the text of a mining report, either by the top or the left hand edge of the sheet. Each line of the form has a number by which reference from the text is simplified. It is suggested that the form be printed in copying

*Paper read before the American Institute of Mining Engineers, Mexican Meeting, by M. P. Boss.

| 20 | Total Deduction..... | | \$ 21.12 | \$ 21 12 |
| 21 | Net Value..... | | | \$ 118.00 |
| 22 | ASSAY MADE AT REQUEST OF..... | | | |
| 23 | DATE OF ASSAY..... | | | |
| 24 | ASSAY NO..... | | | [SEAL.] |
| 25 | CHARGES....\$6.00. | | | Assayer. |

DEDUCTIONS.
Zinc, 2% @ .50.....\$1.00
Silica, 12% @ .10.....1.20
Treatment charges.....5.50
Freight (on 440 lbs. lead to St. Louis).....2.20
Freight charges advanced.....6.70—\$16.60
Net payable to seller.....\$ 5.65

Here the work of the expert mining engineer would begin. The miner would hardly feel that he had much in ore for which he could get only \$5.65 a ton. The engineering problem would be to devise the scheme of treatment of the ore that would increase the net of \$5.65. The assay certificate would show on its face that there was a margin of \$36.61 a ton from which to make this increase.

A great number of assays are made for gold and silver only. For these, only No. 4 and No. 5 of the blank would be used. If an amalgamation assay be made to ascertain the recovery of free metal, the quantities and values would appear on the subdivision lines marked "Free." If in addition cyanide recovery was determined, there would be quantities and values written on the subdivision lines "Free," which would give the value recovery by amalgamation; "Tailings," which would state the value recovery by the cyanide treatment, and "Total," which would give the gross metal content and value, including both the others and the loss in the final tailings. Only the quantities and values on the lines marked "Free" and "Tailings" would be carried forward into the columns giving the commercial values. Only the value on the line marked total would be carried down in that column to the total.

The form, besides being convenient and desirable for recording the returns of assays in a uniform manner, would seem to be specially adapted to the service of mining engineers and metallurgists in considering the assay returns and constructing schemes of treatment based on them. Taking, for example, the hypothetical assay returns discussed above in the text where the determined quantities and gross estimate of market values is \$42.26 a ton, and the realizable sale value as ore \$5.65 a ton, an inspection of the assay return sheet giving the figures is at once suggestive of a concentration which would raise the ratio of the gold content in the concentrates, bringing it over .1 oz., which would be paid for by custom smelters, and reducing the zinc below 10% and the silica per cent equal to or below the iron, thus saving the penalizing for the excess quantities of these minerals. While absolute knowledge of how a particular ore will concentrate is only to be obtained by doing it, approximate knowledge is now sufficiently available to make a probable hypothesis. The estimates of this hypothesis can be written in the columns provided for the commercial figures and its net result obtained with a minimum of distinctive or recording labor. There would also be suggested a scheme based on the separation of the lead and zinc sulphides. With the lead the zinc is not paid for by custom smelters. Separate, it has a realizable commercial value. It is hardly necessary to go into detail in this direction. The applicability of the blanks in facilitating such estimations will readily suggest itself.

In submitting the form the writer's idea is that it is rather suggestive than conclusive. There will probably be suggested changes, or even a complete remodeling, that will more perfectly meet the desired end. This end may be defined as a standardizing of the rule for the estimation of values of metals by assayers and a standard form of recording the estimations, which, combined, will be essentially labor-saving over the existing practice. R. L. D.

Gold Dredging Work.

Regarding the capabilities of a 3-foot Risdon gold dredger, referred to in an article on gold dredging in the issue of the 16th ult., the superintendent of the Kia Ora, a 3-foot Risdon dredger at Oroville, Cal., furnishes the following, which is self-explanatory and makes an excellent showing:

ANNUAL STATEMENT OF WORK DONE BY THE KIA ORA GOLD DREDGER FROM WEEK ENDING OCTOBER 6, 1900, TO WEEK ENDING OCTOBER 5, 1901.

Total working hrs. in above period..7460
Less hrs. lost through want of power. 311

Total possible hrs. dredging....7149 equiv. to 100%
Actual hrs. dredging...5148 equiv. to 72.0% total time
Loss of time—
Stoppage for repairs....1268 equiv. to 17.8% total time
Stoppage for cleaning up, oiling, changing lines, and sundries..... 733 equiv. to 10.2% total time

Totals.....7149 equiv. to 100.0% total time
Total bank yards lifted = 283,750, equivalent to 376,000 bucket measure.
Theoretical capacity of dredger, 101 cubic yards per hour.
Actual capacity reached = 53% of total hours.
Actual capacity reached = 73% of actual hours.
Average cubic yards bank measure lifted per working day = 1320.
Average cubic yards bank measure lifted per possible working day = 950.

ink, so that the assayer can take a press copy of it in full. The assayer can have his business card printed on the blank at the bottom or on the reverse side of the sheet where the back folded would come.

Referring to No. 2 on the form, the scheme of treatment of the ore for which the assay values are estimated commercially, the assayer would cross out with his pen all but the particular one selected. In No. 3 the assayer would write the physical description of the ore sample, whether crude ore, mill pulp, concentrates, tailings, etc. In No. 4 and No. 5 provision is made for free milling and tailing assay values, as well as the usual gross assay value. Under No. 4 a blank is left in which the assayer would write the particular custom works estimated on as the market for the ore. The object of this is to give a concrete basis from which to make commercial comparison.

On the form accompanying this are the assay returns of a sulphide ore illustrative of the practical use of the form. It will be noted that gross values and quantities are given separate from the commercial values that are directly realizable by sale of the ore. The difference between the two shows up directly on the face of the sheet.

Take another example of a sulphide ore, the metal

quantities of which would be returned: gold .09 oz., silver 16 ozs., lead 24.5% [490 lbs.], zinc 12% [240 lbs.], iron 12% and silica 24%. On the form would be recorded gross values as follows:

Gold (total) .09 oz., mint value.....\$ 1.86
Silver (total) 16 ozs., New York value.. 8.64
Lead, 490 lbs., New York value..... 21.44
Zinc, 240 lbs., New York value..... 10.32
Total.....\$42 26

The commercial value as ore would, of course, depend on the particular custom smelter considered as buying it. Each local plant is, in the prices it is willing to pay, determined by its special local conditions. For the purpose of this discussion, assuming the rates and conditions of a custom smelter with which the writer is acquainted, the commercial values recorded on the face of the sheet would read something like the following:

Gold (no value, the quantity being less than .1 oz.).....\$.....
Silver, 13.5 ozs. @ 54c..... 7.29
Lead, 440 lbs. @ 3.40..... 14.96
Zinc (no value).....
Total.....\$22 25

Late Gold Dredging Practice.*

NUMBER VII.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS
by RALPH L. MONTAGU.

CONCLUDING REMARKS.—After having read the description of the various types of dredger, the reader will in all probability ask which is the best dredger? The question is best answered by another, viz.: What is the nature of the ground you propose to work with a dredger? As I have already pointed out, one type of dredger that may be successful in a certain case might be absolutely useless when tried under different conditions. In a number of cases a fair degree of success may be attained with one of the standard type of dredgers, but in the majority of dredging propositions some special design and, if necessary, new ideas can be introduced into the existing types that thereby increase the efficiency and capacity of the dredger. Where conditions confront the engineer which demand a radical departure from any of the standard types unless the engineer has had considerable practical experience in dredging his design is likely to be largely in the nature of an experiment. For every case there is some particular form and combination of machinery that will produce the best results, other types may be a financial success but not so much so as the former.

The engineer should satisfy himself before any construction work is commenced that he has selected the most efficient machinery for the case he is considering.

Intelligent management is a factor of considerable importance, as it is in most businesses, and like many other mining ventures a number of dredging investments have been unprofitable from this one cause alone. Mining engineers who have been eminently successful in other branches of mining have been known to make most lamentable failures when they have attempted dredging, not because the investment would not have proved remunerative if properly handled, but because they had no previous experience in dredging to guide their efforts.

An efficient dredger, properly managed, should actually be digging at least twenty-two hours out of every twenty-four. To those whom knowledge of dredging is merely superficial this may seem practically impossible; but these results have been accomplished in localities where the conditions were the reverse of simple.

If those who are interested in a dredging investment do not obtain these results, they can satisfy themselves that either the best form of dredger for the work has not been installed or that the management is at fault.

The following points, together with what has already been written on the subject, will, I hope, be of some practical value to those who have had no previous experience in dredging, but are desirous of operating a dredger successfully.

The operating expenses of a dredger can be cut down by substituting electric power for steam (without taking into consideration the difference in cost of fuel and electric power, which is in favor of the latter), because a dredger operated by electricity will take from one to three men per shift less than a dredger driven by steam of the same size.

Where it is proposed to operate a number of dredgers and there is no available water power anywhere near, a saving can be accomplished in the fuel consumed by generating electric power at a central station and transmitting it to the different dredgers. The central station can be advantageously located at a distance from the dredgers, as in some localities, owing to the nature of the roads, the cost of hauling the fuel adds considerably to its price delivered at the dredgers.

Wherever electric power can be used profitably it should be done, but under certain conditions, such as cheap fuel, and a relatively small area to be mined, it might be cheaper to use steam.

The parts of a dredger that wear out quickest are all those which are brought in contact with the gravel, such as the bucket chain, shaking screens or revolving grizzlies, sand or gravel pumps, stackers, belt conveyors and the riffles in the sluice box or on the tables.

If the pins that connect the buckets and links are made in such a manner that it is impossible for them (the pins) to revolve, they last considerably longer than pins that are allowed to revolve.

Some shops turn out a bucket chain, the joints of which are protected by moulded rubber bushings. This prevents the entrance of grit or sand into the joints and naturally prolongs the life of the pin. In order not to lose more time than is absolutely necessary it is advisable always to have on hand spare parts to replace the parts that wear, such as extra buckets and lips of the same, pins to connect them, plates for screens and grizzlies, liners for sand and gravel pumps, etc., because when any part breaks through being weakened by wear, it is frequently impossible to get the necessary piece to replace it without a delay of some days, during which time the dredger is idle. In localities where the season, ow-

ing to the severity of the winter months, is short these delays mean a considerable reduction in the annual profits.

In regard to cleaning up it is advisable to find out the percentages of the total cleanup recorded in the various tables, sections of sluice box, etc., and to make any changes that experience will dictate, in order to increase the efficiency of the process.

Better results are obtained when there are three shifts of winchmen or operators per day than where only two shifts are employed in the same time.

Whether the buckets are coming up full or not, etc., depends on the attention the operator gives to his work, and eight hours is the limit during which an operator can do justice to himself on the machine he is handling.

In starting a new dredger the cost of repairs and the lost time will not be so large and consequently the returns will be more gratifying if experienced men are employed in any capacity where experience is needed.

It may seem the words just written are unnecessary, but I have seen a number of new dredgers started into operation with a large majority of their crew totally inexperienced in the work they had to do. A supposed saving was effected in some cases because the wages accepted by these men were less than those demanded by experienced workmen, but the frequent and unnecessary stoppages of the dredger, and the amount of machinery broken while the men were becoming acquainted with their work, more than balanced the small amount saved by paying smaller wages.

In starting a new dredger there is considerable difficulty experienced in finding out where to dispose of the tailings, because the dredger starts at the top of the ground and there is no cut already excavated in which to dump the tailings; this fact alone is sufficient for the patience of most managers without adding to it by having inexperienced men to do the work.

Every unnecessary stoppage of the dredger represents a corresponding reduction in the profits derived from the investment and that there is a want of efficiency somewhere. There are, of course, numerous times where a shut-down is unavoidable, but there have been cases that are well known in their respective localities where with the best machinery obtainable the management has been such that the dredger has been shut down and lost weeks in place of days, and days instead of hours, as would have been the case if any ordinary intelligence had been exercised in the management of the plant.

Dredging, although a modern process of placer mining in the United States, has already attained considerable magnitude. The various systems of dredging have been described without prejudice to any particular type of dredger, the advantages and their respective adaptability to different conditions have been enlarged on, and it devolves now on the engineer to choose, with the help of these pages, from the many the one type that will accomplish most successfully and efficiently the work to be done.

Gold Road and Boundary Cone, Ariz.

[STAFF CORRESPONDENCE.]

This district is in the River range, in Mohave county, from 12 to 15 miles east of the Colorado river. It is about 27 miles southwest of Kingman and 20 miles northeast from Needles, Cal. The camp is reached by good wagon roads from both points. The trip from Needles requires ferrying across the Colorado river. Kingman people call it the Gold Road district, because the Gold Road mine, located by Kingman parties, is the initial point reached from Kingman. Needles people designate it as the Boundary Cone camp, that being the name of a prominent peak in the western portion of the district. This peak is a landmark for surveyors, as it marks the location of the thirty-fifth parallel. The camp extends along the western slope of the range, covering an area about 4 by 7 miles. The general trend of this range is northerly and southerly, though it is so broken as to partially destroy the form of a continuous chain. The formation is porphyritic, with outcroppings of ledge matter both crosscutting and running longitudinally with the stratification. Thus there are veins running north and south and others east and west. The vein matter may be characterized as a quartz and spar, carrying streaks of brown hematite, all three of these materials bearing free gold. It is also quite apparent that much of the partially decomposed porphyry is slightly impregnated with gold. In the white quartz and spar the gold particles are the finer, the coarser particles, flakes and small nuggets being usually within the iron seams. Ores that will horn out free gold are readily found; and this seems to apply to those coming from considerable depth as well as near the surface. It is believed the usual method of amalgamation, with cyanide treatment for the tailings, would thoroughly save the values. In looking over the district generally one observes numerous veins exposed whose surface showings are excellent, so far as width and character of ore are concerned.

The Gold Road mine, whose vein crosscuts the for-

mation, is in the eastern portion of the district, well up toward the top of the range. This property belongs to O. P. Posey, William Bailey, Clarence McCornick, George Kisingbury and others of Salt Lake City, Utah, the last named being general manager. Development consists of a 185-foot shaft, with a considerable amount of drifting in the ore. At 160 feet depth a flow of water was struck, which increased with depth to such an extent as to stop work in the bottom of the shaft till pumps could be put in. A 44 H. P. gasoline-operated air compressor is used for drill work and a 12 H. P. gasoline hoist is in use. Supt. E. W. Mellarky states that the mine produces about 14,000 gallons of water per day. He also states that development discloses about 50,000 tons of ore in sight.

The Lohengrin and Hilty ledges, practically paralleling the Gold Road, show also the characteristics above noted, but are developed but little.

In the western portion of the district, around Snowball camp, are the Treadwell, having a 180-foot shaft, the Snowball, with a 100-foot shaft, and the Dewey—all the property of the Snowball M. Co. These locations cover two ledges, which intersect each other. Work on the Treadwell shows a width of 40 feet between the walls. This group is under the management of O. F. Kuencer of Kingman. A supply of water was struck in the Snowball at 55 feet depth, and on the Dewey at a depth of 10 feet.

Carl Tanner and Sam Klopfenstein have a number of claims in this locality, whereon they have some development, the ores from which they have carefully sampled and assayed, returns running from \$36 to \$340 per ton.

The most remarkable showing of free gold in the district is to be seen on an east and west ledge, covered by the Indian claims, now belonging to Thomas Ewing. The gold here is seen in the quartz, spar and hematite, much of it being in flakes and small shots.

The Leland group of eight claims, covering one main ledge and several lesser ones, all trending north and south, is developed by two tunnels, both on the vein. The lower tunnel has been driven 380 feet, the upper 150 feet. This work shows the width to be 10 to 30 feet between walls, and that the high values are usually next to the hanging wall, but that the entire width will average well. The lower tunnel gives a depth of 500 feet below the surface. The plan is to drive a third tunnel at a point 200 feet lower. It is said electric power may be generated at the river and transmitted to this mine. The Leland group was located by Lane & Spear, who sold it to S. A. Bedell, the latter bonding it to Thomas Ewing of Los Angeles, Cal., who represents a syndicate of New Yorkers. It is said the money is at command to erect a mill as soon as the mine is sufficiently developed.

Developments in this district are not sufficiently advanced to enable one to make a general estimate of values, though it would appear that \$15, \$20 and \$30 per ton are approximate averages of the ores sampled.

The Rattan mine, northwesterly from the Gold Road, belongs to St. Louis parties and has a small stamp mill operating on free milling ore.

On Silver creek is the Mascot mine, belonging to Hawkins & Miller, and the Columbia, to P. H. Collins, who is developing the property.

Kemper Bros. of Kingman sold the Gold Road Extension to George N. Hooper of Los Angeles, Cal., for \$35,000. It is also reported that Mr. Hooper bought other claims covering portions of the same ledge. It is also stated that the three claims of the Hilty group have been bonded to Thomas Ewing, the amount named in the bond being \$75,000.

Kingman, Nov. 30.

Earth Temperatures in Mines.

In general, but not always, the highest temperatures are found at the greatest depths. Temperatures taken at different parts of the same stratum at the same level sometimes differ 5° C. The air temperature at any level is usually lower than the rock temperature, the difference being occasionally 10° or 11°. Sometimes the air temperature has been found to be 5° higher than the corresponding rock temperature. The highest temperature observed was 39° C. at 677 meters; but this may have been due to local causes. The highest air temperature was 34½° at 776 meters. The layer having an invariable temperature of 9° C. was situated at 25 meters below the surface. Determination of the depth corresponding to an increase of temperature of 1° C. varied considerably. At points of depth below 100 meters this depth varied from 13 to 25 meters; at 200 meters, from 12 to 31 meters; at 300 meters, from 19 to 40 meters; at 400 meters, from 18 to 40 meters; at 500 meters, from 20 to 37 meters; at 600 meters, from 22 to 35 meters; at 700 meters, from 21 to 36 meters; at 800 meters, from 27 to 30 meters.

If averages are taken, this depth is found to be for each 100 meters: Less than 100, 22 meters; than 200, 23 meters; than 300, 28 meters; than 400, 27 meters; than 500, 28 meters; than 600, 28 meters; than 700, 28 meters. In a general way it may be said that each increase of depth of 28 meters corresponds to an increase of 1° in temperature.

Mining and Metallurgical Patents.

Patents Issued December 3, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS.

GOLD SAVER.—No. 687,875; M. Flatland and B. Lister, Vallejo, Cal.

A hopper having a screen member, an inclined surface below screen; an incline parallel with before-mentioned incline, leaving a space between connecting with chamber below inclines; an outlet from chamber emptying into bottom of an amalgamating pile consisting of a series of hemispherical plates mounted upon a central shaft and surrounded by a cylindrical shell open at top, and having an inlet at bottom connected with hopper; means for agitating pulp passing from hopper to amalgamating pile.

CONCENTRATOR.—687,908; S. W. Traylor, Denver, Colo.

A table having a yielding supported inclined surface located at one corner of tail thereof, and sloping downwardly to concentrating surface of table, springs connected with inclined surface underneath, and a bar slidingly connected with springs, bar being pivoted at one extremity and arranged to swing below and in a plane parallel with concentrating surface of table, whereby as bar is moved area of inclined surface may be regulated at will, and greater or less portion of inclined surface made to coincide with plane of concentrating surface of table.

COMPOUND ROTARY PUMP.—No. 687,853; J. Richards, San Francisco, Cal.

A casing containing two interior chambers bounded peripherally by curved walls, a driving shaft passing through both chambers in the line of the axes of their peripheral walls, an imperforate disk partition in first chamber dividing it into two waterways in communication by means of an annular peripheral passage formed between disk edges and curved wall of

chamber, an impeller on driving shaft in first waterway of chamber, a removable annular throat ring provided with inclined wedge-shaped partitions forming between them smooth straight passages approximating a tangential direction in line of motion of impeller, interposed between impeller at its periphery and entrance to annular periphery passage, impeller forming a running joint with entrances in throat rings, baffle plates in second waterway supporting disk partition, a curved dischargeway from second waterway to second chamber, an impeller on shaft in second chamber facing oppositely from first impeller, a removable annular throat ring with inclined wedge-shaped partitions surrounding second impeller, forming a running joint with periphery thereof, throat ring having inclined passages discharging into annular peripheral passage of second chamber, and an outlet from second chamber.

COMBINED CONCENTRATOR, AMALGAMATOR AND SEPARATOR.—No. 688,096; W. O. Journeay, Austin, Tex.

Receptacle having a cylindrical body and frusto-conical ends, each end having an opening, removable caps to close openings, a band surrounding body, journals fixed to band, means for turning receptacle on its journals, a stirring shaft with detachable fingers, or their equivalents, spider journals in each end of receptacle supporting stirring shaft, a damper cut-off in lower end of receptacle, an extension shaft with stirring devices, and a detachable cylindrical separator adapted to be secured to lower end of receptacle.

ORE TREATING FURNACE.—No. 687,713; H. S. Bailey, Denver, Colo.

Brick side and roof walls, end piers, end rings and bed plate at the ends of walls, journal boxes and their stands mounted on bed plate and piers, an ore treating cylinder having open ends, means including an axial shaft in cylinder provided with blades for feeding and discharging ore into and from cylinder, trunnions secured to ends of cylinder by arms and journaled in boxes, means including a combustion chamber for heating cylinder, a hollow shaft journaled in trunnions and passing through cylinder, hollow, obliquely inclined arms mounted on shaft having perforations in their sides and ends, perforations through shaft registering with chamber of hollow arms, means including a blower for forcing air into cylinder through shaft and hollow arms, obliquely inclined arms comprising blades also mounted on hollow shaft, a partition supported by one trunnion extending into cylinder at its central portion and arranged to be moved axially and concentrically of cylinder and arranged to divide it into two independent compartments, and means including cones and gears for imparting different rotative speeds to cylinder and hollow arms in same or in different directions.

SUBMARINE DREDGER AND GOLD SAVING MACHINE.—No. 687,830; J. A. Kirk, San Francisco, Cal.

Shell or body of dredger, means for submerging dredger, means for excluding water therefrom when submerged, an excavator, a closed sluiceway, means for forcing excavated material and water under pressure along sluiceway, a spreader therein concaved downwardly and having a central V-shaped rib on its under side, the sluiceway having a narrow port or slit opposite to V-shaped rib, and means for discharging fluid under pressure through port.

APPARATUS FOR CHARGING OR DISCHARGING CYANIDE VATS, ETC.—No. 687,920; A. D. Jansen, Johannesburg, South African Republic.

A pair of tanks placed one above the other, a vertical rotary shaft A centrally of tanks, scraping arms carried thereby within lower tank, a threaded bearing block at upper end of shaft, in which block shaft is permitted to rotate while being held against longitudinal movement therethrough, an outer hollow shaft having interior screw threads engaging bearing block, means for operating shafts, a vertical tubular framework encircling upper portions of outer shaft and a tubular shaft K encircling framework and having threaded projections, a tubular shaft J' encircling shaft K, the projections carried by tube or shaft K having threads engaging corresponding threads in shaft J', means for rotating shaft J', a boss K' on shaft K within upper tank, a hub L rotatably mounted thereon carrying scraping arms, and means for rotating hub.

FURNACE FOR TREATING ORES.—No. 687,918; F. B. Durr, Tacoma, Wash.

A hearth of regenerators arranged at ends of hearth and extending below its plane, a support for solid fuel arranged at upper end of each regenerator and lying in same horizontal plane as hearth but exterior to and below top of bridge walls of latter, auxiliary regenerators arranged adjacent to regenerators, regenerators being provided at lower ends with communicating flues, the auxiliary regenerators being provided at upper ends with air inlets, stacks communicating with auxiliary regenerators, and cut-offs arranged in stacks.

MINING SUMMARY.

Specially compiled and reported for the
MINING AND SCIENTIFIC PRESS.

ALASKA.

JUNEAU.

The Alaska-Juneau G. M. Co. is preparing to run a tunnel 3000 feet long, 8 feet wide and 7 feet high through Juneau mountain, 1 mile below Juneau, commencing the work in the spring. Preliminary work in the way of surveying will be done this winter. The object of the tunnel is to crosscut the veins in Juneau mountain, and at the same time open up the company's properties in Silver Bow basin beyond. In the spring buildings will be constructed and compressed air drills placed in operation. The cost of boring the tunnel and opening the gold veins which it will pierce is estimated at \$1,000,000.

The Alaska Perseverance Co. has commenced a tunnel on the opposite side of Juneau mountain, but its tunnel is 1100 feet above the site selected by the Alaska-Juneau Co., which is only slightly above the sea level.

VALDEZ.

The Meenich Bladdaugh M. Co. of Elamar, Alaska, will ship by steamer 1000 tons of copper ore a month from the Elamar properties near Valdez. The first shipment of 1000 tons of ore is expected to arrive at Puget sound about December 10.

ARIZONA.

COCHISE COUNTY.

A strike of copper ore has been made on the claims owned by W. H. Brophy, R. S. Hunt, A. Sowles, J. Connelly and J. Bell, near Bisbee. The ore was uncovered only 4 feet from the surface while starting a shaft, and runs from 15% to 25% copper.

R. Toobey has sold four mining claims in the Harqua Hala district to S. A. Dorsey of New York.

The Huachuca Con. Co. of Bisbee has bought the Wickersham mines, located in the Huachuca mountains. The company now owns twenty-two claims.

GILA COUNTY.

A. C. Sieboth, who is developing the Welch copper claims near Globe for the Pinto Creek C. Co., says that the shaft at the depth of 146 feet is in high grade sulphide ore, an unexpected find, as the shaft was located on supposed barren ground between two ledges which outcrop some distance apart. The company is composed of Houghton county, Mich., people.

GRAHAM COUNTY.

At the Gold Mountain of the Galluros the ore shoot is said to be over 600 feet wide, and more than a thousand feet long exposed in the crosscut of the box canyon that cuts the vein at right angles, over 300 feet in depth. Thirty miners have been making a cut across the vein in the canyon, which for the 400 feet already cut is all in ore. Samples taken from all of the workings and exposed parts of the vein to get an average gave an assay return of \$5.60 in gold.

MARICOPA COUNTY.

G. E. Sanders, who recently sold his claims near Wickenburg to the Idaho Con. C. M. Co., is to start development work for the company on an extensive scale. The group consists of a mineralized dike in which there are two pay streaks of high-grade ore, one from 6 to 12 inches in width, the other 3 to 5 feet, on which about 300 feet of development work has been done.

PINAL COUNTY.

The Casa Grande C. & G. M. Co., the owners of the Jack Rabbit mine, near Casa Grande, it is reported, propose to treat the ore by the hyposulphite lixiviation process. The values are gold and silver, the latter in the form of chloride.

YAVAPAI COUNTY.

(Special Correspondence).—The most important operations on Lynx creek are by the Penn M. Co., on the south side of the creek, and the Dartmouth M. Co., on the north side. The latter have a group of eight claims, on which they have a bond from J. Breslin and B. W. Traylor. The active men in the Dartmouth Co. are M. S. Taft, V. R. Salinger and E. S. Feinerman, who are Eastern people. Within the last three months a steam hoist and shaft-house have been provided and a shaft sunk 100 feet, from which 10,000 gallons of water per twenty-four hours are lifted with a sinking pump. In doing this work 200 tons of fair grade mill ore have been taken out. The vein is a contact between granite and syenite, the gangue being quartz and a partially decomposed porphyry. The vein dips eastward. The values are silver, gold and lead. A drift has been started from the

shaft. The work is in charge of J. Breslin, who states that the erection of a concentrating mill is contemplated.

The Penn M. Co., W. L. Bell Supt., have a well-developed mine and a successful mill. The original shaft is down 517 feet, on the dip of the vein. A description of the underground workings was given in the issue of March 16, 1901. Since that date a new shaft has been sunk on the same ledge 700 feet north of the old one. At present 200 feet depth has been reached, but it will be continued to the 500-foot level. This new shaft, which sinks on an incline in the hanging wall, is well timbered, having a compartment for the skip and another for the manway. At the different stations crosscuts will be run to the ledge and connection made with the old workings to the south. It is said the ore on the 500 level is of even better grade than that from higher levels. At the new shaft-house is a steam hoist and dynamo for light. An air compressor for drill work is also to be put in.

The mill treats eighty-five tons of ore daily, the equipment being crushers, three Huntington mills, Bartlett and Wilfley tables. The ores comprise an iron, lead, zinc and copper sulphide. The middlings are cut out from the tables and run separately. They carry about 20% to 27% zinc, with considerable gold, the product being sacked and shipped to the zinc smelter at Canyon City, Colo. Most of the silver is saved with the lead and iron concentrate. It is stated that the average saving last month reached 87%, and that not over 40 cents in gold to the ton of ore is lost in the tailings.

The Accidental mine, partially developed, has been sold to the Poland M. Co., whose holdings extend from Big Bug gulch across the mountain to Lynx creek. Walker, Dec. 5.

(Special Correspondence).—The Bunker Hill, near Chaparral, is being developed and has a 350-foot tunnel on the vein, and a 140-foot shaft at a point on the same vein, with 120 feet of drifting from the shaft. It is claimed they have a 20-foot ledge, with an 18-inch pay streak. The ore is gold-bearing quartz, carrying some copper.

Chaparral, Dec. 9.
(Special Correspondence).—The Prosperity M. Co. have a group of four mining claims in Copper Basin district, 12 miles west of Prescott, on the Skull valley side of the range. Considerable development has been done, disclosing a ledge of silver-lead-copper ore, assays of which showed an average of about eighteen ounces silver, 44% lead and 4% copper. This and other properties under development, controlled by Douglas, Lacey & Co. of New York, are managed by L. D. Phillips of Prescott.

Prescott, Dec. 9.
At the Congress mine, at Congress, Mr. Staunton manager, the old mill has been taken out and is being replaced by a new 80-stamp mill, which will go into service about Jan. 1. The ore crushed will be doubled; thirty to thirty-five tons daily increase in the concentrates will be made. The workings are now down 3150 feet in one shaft, 1700 and 600 feet in others. The ledges have widened and the lower levels are estimated to have enough ore in sight to run the mill for several years.

F. Kuhne and G. C. Waddell have made a shipment of ore from their Quartz mountain group of mines, near Prescott, which sampled \$80 per ton gold.

The Union mine, formerly owned by Luke Bros., has been sold to Michigan people, represented by W. J. Rainey of Detroit. The ore is silver-bearing galena, carrying gold and copper in quartz gangue.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—Defender Mine: A 6-inch Cornish pump has been installed and works satisfactorily. The mine has been unwatered to the 300 level and sinking resumed. This property has outgrown its power plant, sinking being done on day shift and the mill being run at night. As soon as the owners have decided on a system, the entire plant will be taken out and the mine fitted with adequate machinery.

Belmont Mine: John McKelvey is operating this mine, which is a continuation of the Defender ledge. The shaft is now nearly 150 feet deep in high-grade ore. Baby machine drills are in use, run by steam.

Mitchel Mine: Ten stamps are kept running to their full capacity. The management contemplated another ten stamps, but the construction will be deferred until spring.

Tuscano Mine: The Amador-Phoenix Co. are opening up this mine. The new shaft is down 140 feet and equipped with a Ledgerwood double engine. The 100-foot station is being cut and, when finished, sinking will be resumed. The construction of the mill is finished, and, as soon as the

tramway from the shaft to the mill is connected, milling will commence.

Standard Electric Co: The connection has been made in the long tunnel between the Tabeaud reservoir and the river side. The Page dam is also completed, and the only thing necessary to put the electric plant in motion is the completion of the pipe lines from the top of the river bank to Page's dam. The company expect to be running in two months. They have 5000 inches of water and a head of about 1500 feet.

Clinton, Dec. 5.

J. Gardella of the Big Bar bridge has made a test crushing of ore from his quartz mine at the Light House mill for parties looking at the mine with a view of buying.

A trial run has been made of the cement gravel in the new roller mill at Upper Rancheria. The company, New York people, has spent a large sum in preparing for the operation of the property. The milling capacity is 150 tons per day.

Work is in progress preparing for gravel mining on the Finch ranch, near Forest Home, which has been leased by Miller & Co. from E. Ekels. Twenty men are at work grading, and putting up a mill. The ground has been worked over before, but it is believed that it will pay to rework with better appliances. The company intends to operate the mills with oil as fuel.

The Cranmer Bros. have started up a 2-stamp mill at their quartz mine on Elsie creek, near Drytown. The stamps weigh 1000 pounds each and are run by an overshot wheel.

G. A. Gritton, on his gravel claim at Volcano, has commenced work.

A concrete foundation has been put under the engine used for hoisting at the main shaft at the Keystone mine, Amador City, and a new gallow frame erected. The addition to the mill is all ready for the machinery.

CALAVERAS COUNTY.

The entire group of mines, including the Stickle, Madison, Cross and Utica, started up on the 5th inst., after being closed for a month while repairs were being made on the water system and machinery. About 600 men have gone to work for the winter.

It is reported that an exceptionally rich strike has been made in the Gold Hill mine near Angels Camp. A large vein of ore running \$48 to the ton has been uncovered, and it is reported that the mine has been shut down until machinery can be put in.

Work is progressing rapidly at the Melones. The flume is completed except half of a mile still under construction. A large wooden pipe has been laid across Coyote creek, connecting the flume with the water tunnel.

The Royal M. Co. at Hodson will put in machinery to use oil as fuel at the mill.

EL DORADO COUNTY.

The Blackjack mine at Centerville has closed down for the winter.

At the Gold Bug mine, near Georgetown, Supt. Thorne says the pipe line for the new hydraulic elevator is completed and the elevator set up ready for operation.

F. S. Chadbourne, manager of the California Slate Co. at Placerville, has men at work and is getting everything ready at the quarry to resume manufacturing and shipping roofing slate. Work will be started with the machinery already on the ground, but it is the intention of the company to install heavier machinery in the spring.

MONO COUNTY.

The 3-stamp mill at the Golden Gate mine, near Bridgeport, has been started up, with fifty tons of ore in the ore bin at mill and an abundance of ore in sight at open cut being mined. E. F. Donivan is manager.

A Philadelphia company is having development work done on the Belle mine, near Benton, with a view to investment. The ore is to be worked for gold and silver. The deposit is low in grade but very large in amount. W. C. Pidge is Supt.

NEVADA COUNTY.

At the 16 to 1 quartz mine at Washington, owned by Dillon & Son, development work is being done. The mine is a large low-grade proposition, the ledge being from 20 to 40 feet wide and yielding in the mill on the mine from \$3 to \$6 a ton. The average cost of mining and milling, using water power, is 75 cents a ton. Some runs have been made at as low a figure as 45 cents a ton.

At the Eclipse mine at Gold Flat, near Nevada City, B. Hoskins Supt., the new hoisting machinery is in place and started up. The incline is now down about 100 feet and follows the ledge from the surface. The vein is about 8 inches in width. The water level has not yet been reached, but pumping machinery is in readiness for it.

SACRAMENTO COUNTY.

D. Cameron, manager of the Ashburton M. Co., an Eastern company, reports that last week's clean-up of the dredger working near Folsom netted \$6000 in gold dust. He said this figure represented the average weekly earnings for some time past.

SAN DIEGO COUNTY.

F. Guerra, manager of the California King G. M. Co., is to open up the company's claims at Picacho without delay. A large number of men are at work.

SISKIYOU COUNTY.

The Deadwood M. Co. has been incorporated, with L. F. Montague, C. Paige, A. R. Vining, J. W. Pews and F. W. Mahler of San Francisco as directors. N. Graves has a contract for putting up hydraulic plant at the company's mine on Deadwood creek, near Yreka.

The John Quincy placer mine at Oro Fino has started up. The McKeene mine has been started up after an overhauling of the cyanide plant. Another 40-ton vat has been added.

Work has been commenced at the Red Bird quartz mine, near Yreka, and a shaft 200 feet deep will be put down. The mill is ready for crushing.

TUOLUMNE COUNTY.

The Stockton Gravel M. Co. has started up their gravel properties, known as the Philadelphia Diggings, at Columbia. W. Tucker is Supt.

The Contention mine, on Knight's creek, above Columbia, is said to be yielding ore of splendid value. The vein varies between walls of granite from 10 to 18 inches in width and mills about \$25 per ton. The present workings consist of a 200-foot tunnel and upraise to surface. The Tibbit 5-stamp mill has been removed from Eagle creek and set up on the Contention.

The Bourbon mine, near Columbia, has been bonded to Colorado people by P. Copella & Co. A shaft 80 feet in depth comprises the development work which exposes a fine ledge.

At the Harvard mine, near Jamestown, it is reported that work will soon be commenced on extensive improvements. A new hoist, boilers, engine, etc., are to be set up at Shaft No. 1 to sink to a depth of 1500 feet. The rock breaker will be rebuilt, an addition made to the concentrating room and a chlorination plant erected. There will also be a series of pumps put in.

Captain Hewitson, Supt. of the Norwegian mine, Tuttletown, and Foreman Thorpe have started work on the mine.

The Mt. Lily mine, near Columbia, has been bonded by Woodruff & St. Clair and has been started up again. Mr. St. Clair is Supt.

G. Bates of San Francisco has bought the L. C. Tibbitts stamp mill, which will be refitted and put on the Contention mine at Bourbon.

The Cracker Jack mine, near Columbia, has made a shipment of bullion from ore taken out in development work. Q. Eckel and W. E. Cole are the owners.

At the Contention mine on Knights creek, above Columbia, twelve men are employed. C. Summers is Supt. The mine is worked through tunnels. The company has rented the 2-stamp mill from J. T. Newcomer and is running it with a steam engine, reworking the tailings.

N. Clark, Mrs. R. D. Clark of Stanislaus, G. W. Kattan of Tuolumne, Mrs. M. L. Reed of Alameda and R. Robinson of Illinois have bonded to L. F. Triplett and T. F. Woodside of Tuolumne, J. W. Woodside of Stanislaus and A. L. Homer of Alameda 100 acres in section 15, township 2 north, range 14 east, known as the Springfield Tunnel Co.'s placer claim, on Table mountain, west of Columbia. The option is for twelve months at the price of \$18,000.

COLORADO.

CHAFFEE COUNTY.

A mill for the low-grade lead-silver ores in the Eclipse mine at Monarch will soon be in operation. This mine is bonded to the Fern M. & Leasing Co., of which J. C. Mitchell of Cripple Creek is president, B. Disman of Salida secretary and C. Bovard of Monarch general manager. The milling plant of the Ross M. Co. of Bonanza has been bought. Its capacity is fifty tons daily. The mill will be set up at Garfield and operated by water power.

CLEAR CREEK COUNTY.

The Eastern & Western G. M. & M. Co., operating the Chicago Belle mine near Dumont, has bought the Elm City claim, on which the Williams tunnel has been driven for 500 feet. Manager C. L. Jaynes has planned to drive the Williams tunnel ahead to intersect the Chicago Belle lode at a depth of 700 feet. The company owns water rights on Mill creek and will install a power plant and drive the tunnel with power drills.

Manager Wilcox reports that several ore bodies are opened up at the Waldorf

mines, at East Argentine, and the work of developing them will be carried on during the winter, preparatory to putting machinery on next spring to drive the tunnel through the range.

At the Gold Dirt mine at Empire the amount of ore blocked out is said to be greater than ever. It is understood that further development work will be pushed at once and the erection of a 100-ton mill has been determined on.

GILPIN COUNTY.

C. V. Hanks has leased the Woods mine near Central City. The mine is a producer of uranium in paying quantities. The shaft is about 200 feet deep and additional machinery to develop and operate the property will be put on by the lessee.

C. Hesselblum, Supt. of the Argosy mine at Central City, has let a contract to extend the 200-foot level.

The Gowers Syndicate are said to propose sinking the main shaft of the Run-ning lode in Black Hawk another 100 feet. The output for several months has averaged sixty tons of smelting ore, besides from 125 to 150 tons of mill concentrates. Mr. Dunstone, the manager, will also install a new steam pump.

The Cashier G. M. & Red. Co., through its agent B. L. Campbell of Central City, has bonded the Susquehanna claim, in Enterprise district, and will operate it for the company. The mine has produced a fair grade of ore.

Sinking has been suspended at the Ridgewood mine, in Central City, with the shaft down 620 feet. Two shifts are opening levels at that depth. Boston people are interested and C. F. Sydow is Supt.

GUNNISON COUNTY.

A. Hartman and L. F. Ball of Gunnison have leased the Carbonate King mine, near Ohio City, and will work all winter. The Carbonate King is owned by Gunnison and Pueblo people. The ore carries gold, silver, lead and copper.

LAKE COUNTY.

Owing to the stagnant condition of the sulphide market at Leadville, the yield for November will only be about 65,000 tons of all classes of ores, the greater portion being manganese, zinc and iron.

The Hap Hazard G. M. Co. of Leadville has leased the Hap Hazard mines in Lake Park and is now preparing to work on a very large scale. The company is placing a machinery plant on the ground. The new company is capitalized at \$1,000,000, and is headed by W. M. Harvey, J. M. Maxwell, W. A. Moore and T. Owens.

The Fanchon G. M. Co. is a new incorporation that will operate the Fanchon and surrounding territory, comprising seventy-two acres and located in the Sugar Loaf section, near Leadville. A new shaft is to be sent down to cut the several veins known to cross this ground.

The Penrose mine of the Leadville Home M. Co. is opening up an ore body, according to the statement of the manager, which is 375 feet long, 100 feet wide and 85 feet high, which would mean 193,000 tons of ore, which from present smelter shipments is averaging \$4.50 per ton.

MINERAL COUNTY.

The Jo Jo property, at Creede, owned by A. Kleasner, has been leased for seven years to C. Duncan and J. Davis at a royalty of 10% on all ore running less than \$30 and 20% on all ore over \$30 a ton. Considerable development work has been done in a tunnel. The new lessees are obligated to develop the claims.

OURAY COUNTY.

Manager Warner of the Ledge M. Co. of Ouray, states that the company has built a temporary shaft house on the mine and has repaired the hoisting plant, which was damaged in the fire of Nov. 15th. He says very high grade ore is coming in the low grade veins on the fifth level. The company has ordered a new mill plant to cost \$40,000, and it is expected to be running in the spring.

TELLER COUNTY.

The Fountain M. & M. Co. has been incorporated. The directors are T. C. Moritz of Gillett; J. C. Philippi and N. C. Palaferro of Omaha, Neb.; D. C. Kilpatrick, W. Hoover, N. T. Van Winkle and H. Barton of Falls City, Neb. The company will operate mines in the vicinity of Gillett.

The annual meeting of the Cripple Creek & Colorado M. & M. Co. has elected A. T. Bliss president and R. G. Mullen secretary and general manager, and subsequently instructed the directors to proceed at once to buy for the mine a new steam plant and compressor for machine drills at a cost of not to exceed \$15,000.

Lessee May, who is working on the Gould mine at Cripple Creek, says he will build a substantial shaft house and put on a steam hoist.

The Portland Co. at Victor in November shipped 9000 tons of ore and expects to exceed that record in December. The ore bins at No. 2 shaft have been repaired

and Supt. Trevarthen says that 5000 tons will be handled there this month and an equal amount at the No. 1 or Burns shaft. The bulk of the ore is being shipped to the smelter.

The Black Belle G. M. Co. has decided to operate its mine at Cripple Creek, with W. Bainbridge, Supt. of the El Paso, as general manager. The company will develop the mine from the 300-foot shaft, which will be put down to the 350-foot point, and a crosscut will be run thence to intersect the Black Belle vein, which has produced considerable ore in the upper workings.

W. F. Burns, manager of the Roanoke mine, at Cripple Creek, says he will start the property up soon. It is the intention of the company to put on a heavier plant of machinery and a set of pumps to unwater the property, when sinking will be resumed.

Stratton's Independence Co. has cut a station for the 1400-foot level, completing the 500 feet of sinking they started January last. All the boilers on the property will be operated by fuel oil.

The new schedule for the treatment of Cripple Creek ores makes the same rates at the mills and smelters. The rates are advanced on all ore carrying over an ounce of gold to the ton. The present rates and the old ones are:

| | New. | Old. |
|--------------------------------|--------|--------|
| Up to 1/2 ounce..... | \$3 00 | \$9 00 |
| From 1/2 to 3/4 ounce..... | 8 75 | 9 00 |
| From 3/4 to 1 ounce..... | 9 50 | 9 00 |
| From 1 to 1 1/4 ounce..... | 10 25 | 10 00 |
| From 1 1/4 to 1 1/2 ounce..... | 11 00 | 10 00 |
| From 1 1/2 to 1 3/4 ounce..... | 11 75 | 11 00 |
| From 1 3/4 to 2 ounces..... | 12 50 | 11 00 |
| From 2 to 3 ounces..... | 12 25 | 12 00 |
| From 3 to 5 ounces..... | 14 00 | 12 00 |

The above is the flat rate and the price includes freight and treatment. Ore carrying over five ounces gold to the ton is \$10.50 per ton plus freight, against \$9 per ton on the old rate. Where a miner makes a long-time contract with a 60-day cancellation clause, the rate will be \$1 per ton less than the above figures.

IDAHO.

BLAINE COUNTY.

The Federal M. & S. Co. of Omaha, Neb., has begun operations, putting in winter supplies and starting a few men to work on its mine at Muldoon. The management, it is said, intends next spring to construct a smelter of 100 tons daily capacity. W. T. Coad of Omaha, Neb., is president, and J. Barker of the same place secretary of the company. S. Friend of Hailey is Supt.

CUSTER COUNTY.

Mr. Thayer of Boston, principal owner of the Yankee Fork mine, near Bonanza, recently inspected the mine, and says that the mill, which is reducing from thirty to thirty-five tons a day, will next year be enlarged to double its present capacity, a tramway will be put in, and the mill will be run by electricity.

IDAHO COUNTY.

The Klondike M. & M. Co., near Pierce City, has started its stamp mill. The intention is to make a two months' test of ore so far mined. Two hundred tons will be selected of average ore for this purpose. There are several thousand tons on the dump. C. T. Beckwith of Oberlin, Ohio, is president of the company, and A. Niebergall of Walla Walla, Wash., is secretary.

KOOTENAI COUNTY.

W. C. Brower of Coeur d'Alene, president of the Home Builder M. & D. Co., which owns six claims of free milling gold ore at Wolf Lodge creek, reports that the tunnel has been driven 40 feet, and in another 50 feet will cut the vein 100 feet down. The company will work all winter.

LEMHI COUNTY.

The Queen of the Hills group and stamp mill, near Salmon City, have been bought by Salt Lake City, Utah, people, including M. Shaughnessy. E. Hill, the present owner, is to receive, it is reported, \$50,000 within thirty days for the property. It is reported that the change in owners will be followed by the erection of a larger milling plant.

Tin in veins is reported struck in considerable quantities, according to N. I. Andrews of Salmon City, who says the strike was made on Panther creek, near Salmon City. Stream tin has been found there before.

OWYHEE COUNTY.

A mining suit over the title to the Golden Chariot mine, near Silver City, has been brought in the United States Court at Boise by the company, the stockholders of which are largely San Francisco people, against T. Regan of Boise and the War Eagle Con. M. Co. The Golden Chariot was closed down after 1873 and subsequently relocated and finally passed into the ownership of Regan. The War Eagle Co., holding an option from

Regan, is driving a long tunnel, now in over a mile, in order to reach the vein several hundred feet below the old workings. The present suit is brought for the purpose of recovering the title to the mine, it being alleged that the relocation of the property for alleged non-performance of assessment work was the result of fraudulent conspiracy.

The Blue Bird mine in Plixley basin, about 35 miles east of Silver City, owned by Miller, Kane & Watts, is developed by two tunnels, one 180 feet in, cutting the vein 75 feet down. The vein, it is claimed, averages between 3 and 4 feet in width and smelter returns from shipments show 230 ounces in silver, \$4 gold and 10% lead.

The War Eagle tunnel under War Eagle mountain is in 5700 feet. Estimated distance to Charlot vein, yet to drive, 600 feet. Average progress, about 10 feet every twenty-four hours.

The Howe-Manhattan Gold Mines, Ltd., capital \$100,000, has been incorporated at Boise. The officers are T. Regan president and B. S. Howe secretary and treasurer. The company will develop the Howe-Manhattan group at DeLamar.

P. B. Armstrong, representative of the New York company that has purchased the Banner and Esmeralda mines at Florence, says that the shaft on the Banner mine, now down 200 feet, will be sunk 200 feet deeper this winter. The company has a mill with a capacity of fifty tons daily. Besides the shafts, 1200 feet of drifts have been run on the property, opening up, it is claimed, 20,000 tons of ore. The mill is expected to be running by January 15.

SHOSHONE COUNTY.

The Empire State-Idaho M. & D. Co. has received a new 250 H. P. engine for the Tiger mill at Burke, which will be used to replace the 125 H. P. engine put in when the mill was built in 1896. Besides this engine the property is equipped with an electric power plant, using a water power.

The Banner M. Co. has let a contract to O. B. Olson to extend its tunnel near Wallace 400 feet.

The Flagstaff G. & C. M. & M. Co., with office at Mullan, has been incorporated, capital \$500,000. The officers are W. H. Fraser president and J. E. St. Jean secretary.

WASHINGTON COUNTY.

The smelting plant of the Boston & Seven Devils C. Co., J. A. Smith, superintendent, near Weiser, has been completed, with the machinery all in place, the buildings wired and electric plant installed. Before the plant will be started up a 100,000-gallon water tank and pumping plant will be installed.

MICHIGAN.

HOUGHTON COUNTY.

A third fissure vein of mohawkite has been struck in the Mohawk mine, near Houghton, being found in the second level south from No. 3 shaft. Like the other two veins, it has been found to increase in width going down on it. The Mohawk is now opening up the ground between its four shafts and will soon resume sinking in all shafts.

MONTANA.

DEER LODGE COUNTY.

The owners of the Hannah group, near Anaconda, are preparing for extensive development work during the winter and propose to start a tunnel, to be 800 feet in length, to cut the ore bodies prospected and developed near the surface. L. Burnett of Anaconda, one of the owners, says that on one claim the developments have exposed a vein 60 feet wide which will average over \$6 per ton. The tunnel is to be run with the expectation of subsequently building a mill.

FERGUS COUNTY.

The Philippine group of cyanide prospects, in the Armells district, has been bonded to F. A. Case, representing New York people, at \$60,000, and Mr. Case is now developing the property. The ores of this property so far have been low grade, running from \$2.60 to \$4.50 per ton.

The Speculator Co. of Butte has bought the Fourth of July and several other adjacent groups of mining properties at Pony, paying for them, it is reported, \$50,000.

MADISON COUNTY.

The Omaha & Montana M. Co., of Helena, has bought the Fourth of July mine at Jeanette, paying for it \$50,000. It is the intention of the company to work the property along with the Mammoth claim adjoining.

SILVER BOW COUNTY.

H. L. Frank and J. A. Murray, owners of the Gem mine near Butte, are preparing to sink the shaft 300 feet deeper, down to the 1000-foot point. They have ordered machinery of sufficient capacity to do the work and will begin sinking as soon as it is in place.

NEVADA.

ELKO COUNTY.

C. Brossemer of Bullion states that the Raine copper mine at Bullion has been bonded to Senator Clark of Montana, and that extensive operations will be commenced on it in the spring.

LYON COUNTY.

The Dyer copper claims in Mason Valley, including the old Daniels copper mine, have been bonded to J. A. Cruikshank of Cincinnati, Ohio, at \$40,000 for nine months. Extensive development work on the group is planned to commence in January next.

The Carson river mills at Dayton and Empire expect to be called upon to crush Tonopah ore. Several tests have been made in a number of them and all are said to show the ore to be free milling. One mill, on a test of twenty tons, saved over 90% of all values on the plates and in the pans without cyaniding. Another mill with cyanide treatment offers to return 93% of the silver and 95% of the gold. A number of the mills, it is said, are now making arrangements to work so-called low grade ore.

NYE COUNTY.

The Tonopah M. Co. will take over the mines of the Butler group at the end of December and plans and specifications are being drawn up for large works. Two carloads of machinery are now en route, with a galloways-frame for the shaft. The company intends to sink to a depth of 500 feet, and if the ore bodies hold out water will be brought to the mines from a distance of 45 miles. The cost of putting in water works and other improvements will, it is stated, be \$750,000. Although 500 horses are engaged in hauling ore between Tonopah and the railroad, it is estimated that the ore now on the dumps cannot be moved before next May.

The Tonopah T. & M. Co. has been incorporated at Tonopah, capital \$1,000,000. The directors are C. Brougher, R. C. Gordon, A. L. Hudders, L. L. Oddie and P. Manning, all of Butler P. O.

WASHOE COUNTY.

At the Empire Copper Co.'s mines at Pyramid seventeen men are employed. Supt. Parry says an upraise in the mine has reached an ore body 8 feet in thickness that is exceedingly rich, assaying from 22% to 39% copper, thirty-five ounces silver and \$5 in gold. The ore is azurite.

NEW MEXICO.

LINCOLN COUNTY.

G. W. Hunt has sold his mines near Nogal to J. M. Rice of Parsons City for \$15,000. The assay returns show gold values of \$4 to \$7 per ton from a wide lead and increasing values with depth. The ore is free milling. J. M. Rice has also bought from a Mrs. Anderson of Nogal a group of claims for \$6000.

RIO ARRIBA COUNTY.

E. F. Mertz, representing the St. Michael's M. Co. of Milwaukee, Wis., has made an inspection of the War Eagle group, near Bromide district, and has made contracts for the erection of mine buildings and will keep the mine in operation all winter.

SAN MIGUEL COUNTY.

The Las Vegas Copper Extraction Co. has incorporated at Santa Fe, capital \$500,000. The directors are H. W. Kelly and C. C. Robins of Las Vegas, F. Williams, G. B. Dodge, J. W. Freeman and J. P. Hall of Denver, Colo., and F. H. Hitchcock of Washington, D. C. The office will be at Las Vegas, with a branch office in Denver.

OREGON.

BAKER COUNTY.

The Bonanza mine, Thatcher Supt., near Baker City, makes a November cleanup, it is said, of \$60,000. In addition there is a large output of concentrates, said to be equal in value to the bullion. The Gem mine, in the Sanger district, near Baker City, has been turned over to F. E. Geiser, who has made final payment of \$15,000.

GRANT COUNTY.

The owners of the Magnolia mine, near Granite, have bonded the mine to L. Y. Keedy of Portland at \$100,000.

JOSEPHINE COUNTY.

After a close down for several months the Ida quartz mine, near Grant's Pass, has been started. Two tunnels have been run to the ledge, which is from 12 inches to 4 feet wide. The values are carried in both free gold and sulphurets and range from \$12 to \$25 per ton.

The Gipsy Queen mine at Althouse is a quartz proposition, owned by H. Luethy. The gold comes from a small stringer which has proven very rich. Recently \$2300 was taken from a length of the vein of 23 feet, worked 2 to 4 feet deep from the surface.

The owners of the Copper Stain mine

n the Mount Reuben district, north of Grant's Pass, have concluded to install a 10-stamp mill and other machinery. J. A. Connelly of Springfield, O., one of the principal owners, who has just returned from a visit to the mine, reports that a wagon road will be built to take the new machinery in.

T. W. M. Draper of San Francisco, owner of the Waldo copper mines, states that as soon as the new roads and other improvements are completed about the mines he will put 200 men to work taking out ore and the smelter will be started.

The Granite Hill group of Louse creek, north of Grant's Pass, has been bought by Booth Bros. & Mangum and W. J. Morphy of Chicago, Ill., and M. A. Lathrop of Briton, Mass. The price paid was \$75,000, part down. The mine has both placer and quartz lodes. The latter are under development, but the placer has been worked for many years past, producing annually from \$10,000 to \$20,000. The claims are equipped with several miles of ditches and flumes and two giants.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The Highland Chief M. Co. has started up its new cyanide mill at Deadwood. The mine is claimed to have paid quite well with a 20-stamp mill, but the ore changing, became too refractory to amalgamate well. Experiments have shown that the ore is adapted to cyanide treatment. The new plant has a capacity for about eighty tons daily. The ore runs considerably better than \$10 per ton gold and there is a large amount of it blocked out.

UTAH.

EMERY COUNTY.

The Hecker M. Co. has been incorporated at Salt Lake City; capital, \$30,000. H. Hardy is president and C. B. Jack treasurer and secretary. The company owns the Eagle Nos. 1, 2 and 3 claims in the Summerville mining district. Little development work has been done on the mines. They show a vein said to be 40 feet wide carrying ore with copper, silver and lead.

JUAB COUNTY.

The Western Union M. Co. has been incorporated at Tintic; capital, \$30,000. The officers of the company are C. E. Miller president and D. A. Depue secretary and treasurer. The company owns the Wildcat, Miller, Silver King, Surprise and Copper Queen claims at Tintic.

PIUTE COUNTY.

The Lone Tree G. & S. M. Co. has been incorporated in Salt Lake City; capital, \$5000. The officers are H. W. Ramlose president and J. Christiansen secretary and treasurer. The company owns the Fraction V., Lone Tree, Spar, Overland No. 2, Union, Cinnamon and King Solomon claims in the Gold Mountain district.

SALT LAKE COUNTY.

The Columbia M. Co., having bought the Madge ground, in upper Bingham, is running a tunnel from it to go under the old Columbia workings and save sinking the shaft. It has been definitely decided by the company to build a mill next spring.

The owners of the Nancy Hanks mine of Bingham have contracted for 300 feet of tunneling to the first ledge. The development is to be under the management of J. B. King.

SEVIER COUNTY.

The Pride of Sevier M. & M. Co. has been incorporated at Milford; capital, \$25,000. E. Malmquist is president and C. Meyer, Sr., secretary. The company owns the Blue Bird, Lucky Boy, Surprise and Humbug claims.

SUMMIT COUNTY.

Supt. R. Campbell of the Wabash mine, at Park City, stated that the shaft was under 160 feet and the gallow's frame up. Work on the new compressor pit has been started.

At the Daly-West workmen are employed putting a 6-inch pipe from the 1200 level up to the collar of the shaft. The pipe will empty in a bin on the 1200 level and will take the concentrates from the mill to that point, where they will be loaded into cars for transportation through the tunnel to the shipping station. The improvement does away with the wagon haul.

The Insley group on Scott Hill, at Park City, is leased to A. F. Fern and F. Dallimore, who are sinking on the vein toward, they believe, a good body of high-grade ore.

A strike has been made in the St. Louis and Vasar ground, near Park City, by the leasers. The strike is in the lower workings and an assay returned 49.60 ounces silver, 0.10 gold and 54% lead. W. De Lashmuth of Park City is one of the leasers.

TOOELE COUNTY.

The sampling of the Rover, the Gold

Dust, Silver Lode and the Geyser-Marion group at Mercur, preliminary to their amalgamation under a single head, has been completed. The idea of the projected consolidation is to have the ores of all the mines go to one mill. F. D. Kimball and G. Dorsey of Salt Lake City are the principal promoters of the plan of amalgamation.

The Lake Side M. Co. has been incorporated, capital \$30,000. The officers are: P. W. Madsen, president; R. W. Madsen, secretary and treasurer. The company owns the Neilson group of six claims in the Lake Side mining district.

WASHINGTON.

FERRY COUNTY.

C. T. Porter, Supt. of the Gold Lion & Little Four Con. M. Co. at Republic, has resumed work on the property and is driving the tunnel, which is now in 200 feet.

Manager Hedges of the Wauconda G. M. Co., at Wauconda, says the tunnel is being driven 6 feet each twenty-four hours and is now in 950 feet.

STEVENS COUNTY.

The Easter Sunday G. & C. M. Co., in the Pierre Lake district, near Marcus, is preparing to install a reduction plant. The company has a sawmill in operation and is getting out lumber for buildings.

WYOMING.

CARBON COUNTY.

Assays of ore from the strike made by N. Calmon at Grand Encampment run from 10% to 30% copper, \$2.50 to \$10 gold and about \$8 silver. The vein is claimed to be 7 feet wide.

FOREIGN.

BRITISH COLUMBIA.

The Chicago Copper & Smelting Co. has been incorporated, with offices at Greenwood, B. C., and office at Chicago, Ill. The capital is \$750,000 and the company will develop mining claims and build a smelter. It has bought the Arlington claim at Greenwood.

The Granby smelter at Phoenix is to install a briquette plant to treat flue dust. The plant will have a capacity of 100 tons daily. One of the converters in the smelter will be in operation about New Year's, one of the new furnaces on January 15, and the entire enlarged plant is expected to be in blast not later than February 1.

A steamer is to be put on Horsefly lake, which will cover 25 miles of the route to the late discoveries. A sawmill is to be put in by the Miocene Co. at Harper's Camp and several stores are to be stocked during the winter, using the snow to sled the supplies in.

The annual meeting of the British Columbia Mining Association was held at Nelson on the 5th inst. The officers of the association were re-elected as follows: President, J. R. Robertson; vice-presidents, F. Robbins, manager North Star mine, and B. McDonald, manager of Rossland Great Western M. Co.; secretary, R. F. Tolmie.

KLONDIKE.

The manager of the Dominion Government purchasing assay office in Vancouver says that Klondike miners might increase by thousands of dollars the production of their claims if they saved the platinum that was thrown away in tailings and other waste. He said that in bags of gold assayed in his office there was frequently a good return of platinum.

MEXICO.

About 25 miles west from Carbo, Sonora, the Alma M. Co. are developing a copper property, with A. Graves as manager. Several shafts are being sunk and levels run. From one shaft a level has cut 33 feet width of copper ore of fair grade. Another shaft, inclined with the ledge, is down 100 feet, in good ore all the way.

The American Smelting & Refining Co., which had secured control of all of the principal smelting plants in Mexico, it is reported, is to have competition, companies having been formed to build independent smelters. These are located at Hidalgo del Parral, Guanacavi, Ameca, Torreon, Mapina, Durango and Tepic.

W. B. Gester, Supt. of the quicksilver mine at Saucillo, Chihuahua, states that that mine will not be worked for the present.

Recently Declared Mining Dividends.

Personal.

C. C. BEAN is Supt. of the Aja M. Co., near Gila Bend, Ariz.

H. G. BOND of Santa Clara, Cal., is in Salt Lake City, Utah.

GEORGE BARKLEY has returned from Mexico to Clifton, Ariz.

D. C. JACKLING's permanent address is Colorado Springs, Colo.

G. MCM. ROSS has been re-elected Supt. Mexican M. Co., Virginia, Nev.

C. O. HAMILTON, M. E., of Boston, Mass., is sojourning in Butte, Mont.

A. P. CHITTENDEN has been appointed Supt. Pioneer mine, near Towles, Cal.

H. A. KELLER, manager Trinity Copper M. Co., at Kennet, Cal., has resigned.

W. G. RICHARDS has been appointed Supt. Oriole mine, at Angels Camp, Cal.

C. SUMMERS has been appointed Supt. of the Contention mine, near Columbia, Cal.

F. W. BRADLEY of San Francisco, Cal., has gone to Mexico to remain a few weeks.

MR. GUS TAYLOR succeeds L. R. Mead as secretary Risdon Iron Works, San Francisco, Cal.

MANAGER SINGLETON of the Yellow Aster mine, Randsburg, Cal., has gone to Honolulu, H. I.

A. J. MCMILLAN, managing director Snowshoe mine, at Rossland, B. C., has gone to London.

H. C. JOHNSON, late chemist at the Cananea mines, in Sonora, Mexico, is at Randsburg, Cal.

N. B. KNOX, M. E., has returned to San Francisco, Cal., from a reconnaissance through northwestern Idaho.

W. G. NEBEKER has returned to Salt Lake City, Utah, from several weeks' sojourn in Arizona and California.

O. W. HARPER, who is manager of a large mine in Ecuador, is now sojourning in Minas Prietas, Sonora, Mexico.

F. S. GOLDSMITH has been appointed manager of the Seaton M. Co., at Idaho Springs, Colo., succeeding J. J. May, resigned.

W. A. HENDRYX of British Columbia was at Prescott, Ariz., on the 8th inst., en route to the Empire mine on Groom creek, of which he is manager.

W. C. PIDGE, who was Supt. Inyo Marble Co., near Bishop Creek, Cal., for several years, is now Supt. Belle mine, near Benton, Mono county, Cal.

W. L. THURSTON, formerly Supt. Omaha, Homeward Bound and Lone Star mines, at Grass Valley, Cal., has returned to that place from the Transvaal, S. A.

W. BAINBRIDGE, superintendent of the El Paso mine, at Cripple Creek, Colo., has been appointed manager for the Black Belle G. M. Co., which owns the adjoining claim to the El Paso.

M. F. PARRY, manager of Butters & Co. cyanide plant at La Colorado, Sonora, Mexico, is at Virginia City, Nev., superintending the erection of the Butters & Co. cyanide plant at that place.

W. S. GRAHAM, civil and mining engineer of Auburn, Cal., it is reported, is to be appointed U. S. Surveyor General for California, succeeding to the vacancy made by the death of J. M. Gleaves.

ROBERT ANGUS, mentioned in last week's issue as being superintendent Le Roi M. Co., Rossland, B. C., at an annual salary of \$12,000, leaves the company's employ, as the position he held has been abolished by the company. The highest official at the mine proper will in future be the foreman. L. W. Gunkle has this appointment. The new foreman was formerly in charge of the Utica mine and the Pine Tree and Josephine mines of California.

Books Received.

"Contributions to the Mineralogy of California," by Walter C. Blasdale, and "Mineralogical Notes," by Arthur S. Eackie, with "Chemical Analysis," by W. T. Shaller, are two bulletins of the Department of Geology of the University of California that will be found interesting by specialists in the mineralogy of California. They are parts of the cumulating work that ultimately will make the technical mineralogical literature of California as complete and economically useful as that of Germany is to-day. Published by the University of California at Berkeley, Cal. Price, 15 cents and 10 cents respectively.

"Architectural Engineering," with special reference to high building construction, second edition, rewritten, by Joseph K. Freitag, B. S., C. E., 8vo., 407 pages with 196 figures and illustrations. The work gives in a compact practical form the essential principles of engineering ap-

plied to modern building construction, and has brought down to date in collective form the results of the continually improving practice of the last seven or eight years. The book will be found valuable as a text book for students of modern architecture and useful for reference to the practicing architect. Published by John Wiley & Sons, New York, and Chapman & Hall, Limited, London. Price, \$3.50.

Commercial Paragraphs.

THE preliminary census report on the manufacturing industries of San Francisco show a total capital invested in the industry of \$80,103,367—an increase of 7% over 1890. The value of products in 1900 was \$133,069,416—a decrease of almost 2%. There are 4002 establishments, 41,988 wage earners, \$22,037,527 wages, \$3,826,167 miscellaneous expenses, and \$79,492,952 worth of material used.

COUPLERS, commonly used for connecting hose to hydrants and coupling sections of hose together, are of a type or pattern so long approved that many users of hose have supposed they were the best that could be contrived. Seven years ago Joseph Blackburn, a mechanic of Salem, Ohio, invented and patented what is now known as the "Quick as Wink couplers," so called for the remarkably short time required to couple or uncouple. They are said to be in use in the fire departments of many cities and towns of Ohio and western Pennsylvania, where the old-style couplers have been discarded to give place to the improved one. The greater facility with which firemen handle their hose, having the Quick as Wink couplers on them, compared with handling hose with the old-style couplers, is said to be wonderful, one man being able to make or break a connection in less than a fifth of the time required for two men to do the same with the old couplers. Users of compressed air in shops, shipyards, bridge works, etc., where small hose has to be used, are finding these quick-acting couplers to be time savers, on account of the convenience with which hose can be detached from one place and attached to another place, and several large plants in the East have them in use. Persons desiring more particulars about this improvement should write to the W. J. Clark Co., Salem, Ohio.

A BUSINESS CHANGE which will be of considerable interest is that by which the old established mining supply house of the Parke & Lacy Co., San Francisco, Cal., goes into the hands of Harron, Rickard & McCone. This was brought about by the recent death of Mr. B. T. Lacy, the late President of the Parke & Lacy Co., and the disinclination of the heirs to continue. Of those who will carry on the business hereafter, Mr. J. O. Harron and Mr. Thomas Rickard have long been associated with the old company and for the last few years they have been entrusted with its active management. They are, therefore, thoroughly conversant with the work they undertake and are well and favorably known. Nothing less can be said of Mr. A. J. McCone, who, although not heretofore a resident of San Francisco, is known by many interested in mining as the successful proprietor of the Fulton Foundry, Virginia City, Nev., and Vice-President of the Fulton Engine Works, Los Angeles, Cal. He brings with him a host of friends to the new concern and a great fund of information for the benefit of its clients. The firm of Parke & Lacy has been advertising continuously in the MINING AND SCIENTIFIC PRESS for twenty-five years, and while it seems like losing an old friend to note the absence of the old firm name in our advertising columns, nevertheless this journal heartily congratulates the new concern and wishes them the unbounded success which they deserve. The officers of the new company are as follows: J. O. Harron, President; Thomas Rickard, First Vice-President; A. J. McCone, Second Vice-President; Thomas Steel, Secretary; Louis C. Graupner and James H. Mundy, Directors. The business will be continued at the old headquarters, 21-23 Fremont St., San Francisco, Cal., and branches will be conducted as before at 306 Byrne Building, Los Angeles, Cal., and at Bakersfield, Cal.

Catalogues Received.

THE Allis-Chalmers Co. has issued Book No. 1, a trade catalogue of mining machinery specially descriptive of the Gates rock and ore breaker, and Catalogue No. 9, eighth edition, devoted to the presentation and explanation of concentrating machinery. Both catalogues are up to date and will be found desirable, handy additions to the working library of the millman and expert metallurgist. They can be had on application to the Allis-Chalmers Co. at Chicago, Ill.

Latest Market Reports.

SAN FRANCISCO, Dec. 12, 1901.
SILVER.—Per oz., Troy: London, 25½d (standard ounce, 925 fine); New York, bar silver, 54½c (1000 fine); San Francisco, 54½c; Mexican dollars, 47c San Francisco, 43½c New York.
COPPER.—New York: Lake, 1 to 3 casks, \$17.25; carload lots, \$16.85; Electrolytic, 1 to 3 casks, \$16.75; carload lots, \$16.62½; Casting, 1 to 3 casks, \$16.00; carload lots, \$16.50. San Francisco: 18. Mill copper plates, 20c; bars, 22½c. London: £54 7s 6d per ton.
The quotations are nominal. Sales are certainly being made below the quotations.
LEAD.—New York, \$4.37½; Salt Lake City, \$4.00; St. Louis, \$4.40; San Francisco \$4.90, carload lots; 5½c 1000 to 4000 lbs.; pipe 8, sheet 6½, bar 5½c; pig, 5.25. London, £10 15s per ton—2.36 cents per lb.
SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton—3.58½ cts. per lb.; San Francisco, ton lots, 5½c; 100-lb lots, 6c.
ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13½c.
IRON.—Pittsburg, Bessemer pig, \$16.50; gray forge, \$14.00; San Francisco, bar, 2.60c per lb., 2.65c in small quantities.
STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.
NICKEL.—New York, 50¢@60¢ p. lb.
TIN.—New York, pig, \$27.50; San Francisco, ton lots, 27c; 1000 lbs., 27½c; 500 lbs., 27½c; 200 lbs., 27½c; less, 28c; bar tin, 32½c.
PLATINUM.—San Francisco, crude, \$19 ½ oz.; New York, \$20.50 per Troy oz.
BISMUTH.—New York, 3½ d. 50-lb casks; San Francisco, \$2.50 to \$2.75 p. lb.
QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 p. flask of 76½ lbs.; Export, \$45.00.
MAGNESIUM.—New York, \$2.90 p. lb.; San Francisco, \$3.75.
ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.
BABBITT METAL.—San Francisco, No. 1, 10c.
ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.
SOLDER.—Half-and-half, 100-lb. lots,

18c; San Francisco, Plumbers', 100-lb. lots, 15.25c.
PHOSPHORUS.—F. o. b. New York 50¢@60¢ p. lb.
ASSAY LITHARGE.—San Francisco, 10c p. lb, small lots.
FERRO-TUNGSTEN.—New York, 37½, 32c; San Francisco, 65c (60%).
POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.
CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, 8; Lion, 8, in lots not less than 1000.
FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.
CANDLES.—Granite 6s, 16 oz., 40s., 10c p. set; 14 oz., 40s., 9c.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:
FOR THE WEEK ENDING DEC. 3, 1901.
688,053.—BOILER—J. H. Arrasmith, Colfax, Cal.
688,332.—RAILWAY—W. L. Beach, Los Angeles, Cal.
687,979.—TEA STRAINER—D. Chambers, San Jose, Cal.
687,818.—CAR FENDER—J. Craig, S. F.
688,238.—SACK HOLDER—T. J. Davis, Portland, Or.
687,918.—ORE FURNACE—F. B. Durr, Tacoma, Wash.
687,975.—GOLD SAVER—Flatland & Lister, Vallejo, Cal.
688,083.—CAN SOLDERING MACHINE—J. W. Green, Astoria, Or.
687,745.—CAMERA—F. H. Grover, Fremont, Wash.
687,983.—BOX—Rose M. Hartnett, Santa Barbara, Cal.
687,980.—CLOD CRUSHER—T. J. Hubbell, Watsonville, Cal.
687,956.—POWER PRESS—Jacob & Arthur, Salem, Or.
687,830.—GOLD SAVER—J. A. Kirk, S. F.
687,892.—BOUQUET HOLDER—J. Luth, Alameda, Cal.
688,001.—LOCK—F. H. Mills, Klamath Falls, Or.
688,192.—HAIR CURLER—E. Myette, Fairhaven, Wash.
687,882.—WATER WHEEL—J. Richards, S. F.
687,853.—PUMP—J. Richards, S. F.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:
STARTING DEVICE FOR EXPLOSIVE ENGINES.—No. 688,040. Dec. 3, 1901. W. E. Twichell, St. Helena, Cal. The object of this invention is to provide a starting mechanism for what is known as gas or explosive engines. It consists of engaging clutch members, one fixed to the shaft and the other slidable and revolvable on the shaft, a disk fixed on the revolvable clutch member, a second disk revolvable on the hub of said member, a spring having one end secured to one disk, and its opposite end to the hub of the other disk, a third disk fixed to the shaft which is adapted to engage the fixed disk so that they are made to revolve in unison and coil the spring. By means of ratchets and pawls the disks are engaged and the coil held tenses, and when automatically released by suitable connecting mechanism the spring acts to revolve the shaft sufficiently to start the engine.
CLOD CRUSHERS.—No. 687,981. Dec. 3, 1901. T. J. Hubbell, Watsonville, Cal. Assigned to D. Hubbell and W. H. Ames of same place. This invention relates to an apparatus for crushing and pulverizing clods. It comprises a frame with means for drawing or propelling it over the ground, a series of boards or plates pivoted transversely across the frame and turnable therein, one or more of said plates having knives or cutters projecting downwardly and backwardly therefrom, and others having cultivator teeth similarly projecting while the final plate without teeth carries a seat and is adapted to smooth the surfaces of the ground after the other plates have acted upon it.
TEA STRAINER.—No. 687,979. Dec. 3, 1901. D. Chambers, San Jose, Cal. One-half assigned to L. B. Chambers of San Jose, Cal. This invention is designed to prevent the escape of tea leaves and sediment from the spouts of tea pots and the like. It consists of one or more groups of elastic wire or hair-like filaments arranged to radiate from a central flexible support to which they are connected at intervals so that when inserted into the spout or nozzle they form radiating strainers at intervals from one end to the other. In connection with this is a loop or stop to retain the device in place and by which it can be withdrawn at will.

SITUATIONS WANTED.

WANTED.—By competent man, position as superintendent or assistant superintendent of gold mine. Understands milling and amalgamating thoroughly. Also practical assayer. Address G. H., care Mining and Scientific Press.
WANTED.—SITUATION AS MANAGER OR Superintendent of gold, silver or lead property. Twenty years' experience in managing properties, building mills and ore concentration. Best of references and bonds furnished. Address J. A., care of this office.
MINE FOREMAN WANTS POSITION WITH a big gold mining company. Over 20 years' experience in shaft sinking, timbering, developing and working large gold mines both with machine and hand drills. Address R. F., care of Mining and Scientific Press office.
WANTED.—Situation to take charge of a gold mining plant. I have had 15 years' experience in assaying, amalgamating and concentrating California gold ore. Also understand cyanide and canvas treatment of tailings. Correspondence solicited. Address Wilton E. Darrow, Sutter Creek, Cal.
YOUNG MINING ENGINEER, graduate of one of the best mining schools, desires position. Familiar with Colorado mining and milling practice. Several years' practical experience in assaying, mining and milling. Can assay, survey, keep books, etc. Speak Spanish. Address R., 125 Kittredge Building, Denver, Colo.
WANTED.—POSITION AS ASSAYER OR Superintendent of a mine. Have had experience in putting up mills, cyanide plants, smelters and mine machinery and operating them. Have a good assay outfit. Address Jesse L. Wetmore Jr., Piedmont, Alameda Co., Cal.
ASSAYER WANTS POSITION AT A LARGE gold mine. Thoroughly competent, with wide experience as assayer at copper, silver and gold mines. Now assayer at big mother lode mine. Address R. A., care of Mining and Scientific Press.
WANTED.—A position by a first-class all-round millman. Understands amalgamating and concentrating and care of mills. Twenty-five years' practical experience. Arizona or Mexico preferred. Satisfactory references given. Address "Millman," care Mining and Scientific Press.
THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from W. W. Stone, Sr., in the Red Hill Gravel Mine, near Placerville, El Dorado Co., to deposit tailings in a worked-out pit; from Mrs. Olive A. Stone, in the Ciganc Gravel Mine, near Placerville, El Dorado Co., to deposit tailings in Webber Creek; and from J. B. Lassiat, in the Lassiat Mine, at Poker Flat, Sierra Co., to deposit tailings in a worked-out pit, gives notice that a meeting will be held at Room 59 Flood Building, San Francisco, Cal., on December 23, 1901, at 1:30 P. M.

L. W. TULLEYS, COUNCIL BLUFFS, IA.

ASSESSMENT NOTICES.

DUDLEY MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Bodie, Mono County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 11th day of December, 1901, an assessment (No. 12) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of January, 1902, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 4th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD JR., Secretary.

Office—Room 56, No. 309 Montgomery street, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of November, 1901, an assessment (No. 15) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of December, 1901, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 23d day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—773 Mission street, San Francisco, California.

ORLEANS CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of November, 1901, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 824 Pine street, Room 10, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of December, 1901, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on THURSDAY, the 30th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. P. THURSTON, Secretary.

Office—324 Pine street, Room 10, San Francisco, California.

LARKIN MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 17th day of November, 1901, an assessment (No. 11) of two cents per share was levied upon the capital stock of the corporation, payable immediately to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 14th day of December, 1901, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 8th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of November, 1901, an assessment (No. 35) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 31, tenth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1902, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 8th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Room 31, tenth floor, Mills Building, San Francisco, California.

MARINA MARSHOANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of December, 1901, an assessment (No. 26) of four cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1902, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 27th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—217 Sacramento street, San Francisco, California.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

For Prospecting Purposes
or Underground Work,

USING COMPRESSED AIR.

HOIST FOR PROSPECTING.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

"THE DANIEL BEST"

50 Horse Power

TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

## Mining Machinery

Above cut represents our 40 inch by 15 inch Special High Grade Crushing Rolls of which we built 36 sets for the new 5,000-Ton Concentrating Mill of the Anaconda Copper Mining Co.

These rolls are designed especially for heavy duty, they are very strong in every detail and provided particularly with very strong steel shafts and extra large bearings, the springs and tension rods are designed for the heavy pressure necessary to satisfactorily crush very hard ores.

The contract for these 36 sets of rolls was awarded to us in competition with most patterns in the market, after a thorough investigation by the experts of the Anaconda Copper Mining Co.

Our assortment of patterns for crushing rolls is very large, of all styles and standard sizes, for coarse and fine, wet and dry crushing. We have special patterns for sectional rolls to be carried on mules.

We furnish all shells for our rolls of Midvale "Perfected" Rolled Steel unless otherwise ordered.

## EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeanesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeanesville Pumps.

We claim that in Jeanesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

" lower half.....200 "  
Price \$100. Write for special illustrated circular.

## W. & P. CYANIDE PAINT.

THE VERY HIGHEST GRADE OF PAINT OR COATING FOR

Cyanide and Chlorination Tanks and Vats,  
FLOORS, SINKS AND TRAYS,

Or wherever acids, alkalis or water are used. Excellent also for REFRIGERATORS, being odorless when dry. It is a pure asphalt paint, and therefore unaffected by acids or alkalis. Dries very rapidly to an extent sufficient for handling or for application of second coat, but its full hardness is not attained for some hours, as drying is retarded by use of a heavy oil, and durability of coat is thus greatly increased. When dry is very tough and not brittle like most asphalt coatings. No carbon bisulphid, ether or other poisonous ingredients are used in its preparation, and as it gives out no noxious fumes or gases it can be used in perfect safety in confined places. For purposes given this paint is the equal of any other paint made, no matter if sold at double the price.

In Barrels, - - - 60 Cents per Gallon;  
In Cases, - - - 65 Cents per Gallon.

Can be ordered through the trade. Insist on your dealer getting W. & P. CYANIDE PAINT for you or write us direct.

## PACIFIC REFINING & ROOFING CO.,

113 NEW MONTGOMERY STREET, SAN FRANCISCO, CAL.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

# THE BARTLETT CONCENTRATOR.

## THE LATEST AND BEST CONCENTRATING TABLE.

A Few of Its  
Advantages:

Wearing parts reduced to a minimum. All parts are interchangeable.  
Will take ore from finest mesh up to 6-mesh without sizing.  
A complete substitute for jigs, buddles, slime tables, belt tables, and all systems of complicated concentration.  
ESPECIALLY DESIGNED FOR SEPARATING ZINC FROM LEAD  
Requires little or no attention.

Our illustrated catalogue on CONCENTRATION is very interesting. Mailed on application.

## Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

### CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

### MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## PATENTS

OBTAINED

IN ALL

CIVILIZED COUNTRIES.

EXPENSE SAVED INVENTORS BY  
PRELIMINARY SEARCHES.

COMMUNICATIONS CONFIDENTIAL.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intelligence, acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports since 1793, with full copies of U. S. Patents since 1872. As a result we are able to give reliable advice as to the patentability of an article, frequently saving the inventor the cost of an application. Our Washington branch tends exclusively to our business before the Patent Office. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, including filing of Caveats, Trade-Marks, Copyrights, Labels; prepare Assignments, Licenses and Agreements; give Opinions on Patentability and Infringements, etc. Circulars free on application.

## PATENTS

DEWEY, STRONG & CO., San Francisco, Cal., and Washington, D. C.

We are prepared to transact business with our clients direct from either our San Francisco or our Washington office. We have representatives in every country in the world having patent laws. The information accumulated through long and careful practice before the Patent Office and the frequent examinations of patents already granted, for the purpose of determining the patentability of inventions submitted to us, enables us to advise inventors, often saving them the expense of applying for a patent upon inventions which are not new. All worthy inventions patented through us are described in the *Mining and Scientific Press*. Guide to inventors sent on application. Address

DEWEY, STRONG & CO., 330 Market St., San Francisco, Cal., or 918 F St., Washington, D. C.

## NOISELESS GEARS

We are specialists in NOISELESS GEARING. If you are interested in anything in this line write for our catalogue. Our New Process Gears are the only Noiseless Gears which are durable. We have pinions in operation transmitting from 350 to 450 horse power. We also make metal gears to order, both spur and bevel, the latter planed accurately to cone lines.

**THE NEW PROCESS RAW HIDE CO.,**  
SYRACUSE, N. Y.

## The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot. (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tannage) making the leather Water Proof. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

## Powell's Signal Oiler.

Doesn't interfere with the adjustment. Most perfect Oiler in the world. Haven't you need for such an Oiler? In stock by all Jobbing Supply Houses Manufactured only by

**THE WM. POWELL CO.,**  
Cincinnati, O.

## The Lunkenheimer ("99" MODEL) Standard Injector.

UNIVERSALLY APPLICABLE.

This machine is warranted to show in actual service results hitherto unattainable with any other make of injector on the market. With feed water at 75° F. LIFT 6 FEET, it will work WITHOUT ADJUSTMENT OF STEAM OR WATER AT ALL PRESSURES FROM 40 TO 250 LBS., AND HIGHER, AND THE CAPACITY CAN BE GRADED OVER 50% AT ANY POINT IN THAT RANGE OF WORK. Note carefully, ALL CONDITIONS ARE MENTIONED IN THIS STATEMENT.

The construction is simple and free from all complicated mechanism. All parts are easily accessible and tubes are very durable. In grading the capacity, the steam supply is cut down in proportion to the water, hence the discharge is cool and scale is not so liable to form.

It is thoroughly reliable and can be started promptly under the most extreme conditions, and UNLIKE many others its efficiency is not confined to any particular season of the year. The capacity increases with the pressure. A trial is solicited and satisfaction guaranteed. Write for Catalogue of superior brass and iron Steam Specialties.

## THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

## THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

JAS. S. BROWNELL, San Francisco, Cal.—DEAR SIR:

We have been using your "Patent Lip" flange belt on our "Triumph" Concentrators since May, 1895, and find that they have given better wear than any other belt made. Also the twelve 6-foot Frues with "Patent Lip" flange belts, lately put in here, are giving us every satisfaction.

THE EMPIRE MINES,  
GRASS VALLEY, NEVADA CO., CAL., Jan. 29, 1901.

Yours truly,

G. W. STARR, Managing Director.

JAS. S. BROWNELL, San Francisco, Cal.—DEAR SIR:

The eight "Patent Lip" flange belts purchased from you in December, 1895, have been in constant use in the mill since that time, and have given the best of satisfaction, and have proved to be far superior to the old plain flange belt which we were using. The belts now in use show hardly any wear, and seem to be in as good condition as when first put on the machines; one thing, they do not show any tendency to crack along the edge of the belt.

Yours truly,

JERRY SULLIVAN, Superintendent.

## A New Steam or Compressed Air Stamp Mill.

For the prospector the possession of a light and serviceable prospecting mill, capable of easy transport for long distances, is a matter of prime importance.

The stamp mill illustrated on this page, it is stated, will deal with four tons of quartz per twenty-four hours. A three-head machine with foundation weighs 1300 pounds. A complete plant, including boiler and accessories, copper plates, water-service tank, water raiser and connections, weighs about 5000 pounds, without road carriage. Both the stamp battery and the boiler are portable, as they are mounted on separate road wheel carriages, and the plant can be erected ready for work or dismounted for transport in a few hours. The battery and carriage cost \$1250. Some of the features in this mill are:

The large output of ore treated as compared with the weight of the mill; the high speed of the stamps, 250 blows per minute. It dispenses with a steam engine or other mechanical motors to drive, only a boiler being required. Compressed air will serve equally well; high efficiency as shown by reports obtained; low cost for maintenance and repairs, the upkeep of shoes and dies amounting to only 2 cents per ton, due to positive rotation of the stamps. There is less vibration than with gravitation mill, and heavy foundations are not required; the mill can be worked on its carriage by placing timber, packing pieces under box and taking bearing on the ground. Old mills can be converted, as in this machine the ordinary shape of mortar box is not departed from,

and the new portions can be used with mortar boxes of the recognized type. The illustration shows the three-head mill in operation, complete with locomotive boiler to drive it.

The following analysis of work done by the "A" size prospecting mill at the Coolgardie, Australia, Exhibition, 1899, shows the efficiency of the plant: Stone crushed, 50 tons; mill ran 295 hours; average, 4.07 tons per twenty-four hours; smelted gold obtained, 68 ounces 8 dwts. 3 grains; average grade of ore crushed, 1.68 ounce per ton; average extraction, by amalgamation, 88.5%; average yield per ton, 1.36 ounce. For the illustration this journal is indebted to the courtesy of Compressed Air.

LOW WORKING COSTS of mining and milling are just as desirable in the operation of a mine producing high-grade ores as in the operation of a mine producing low-grade ores. They are absolutely necessary as a commercial condition with the latter. The fact that a mine pays a large sure profit from high-grade ores should never be considered a reason for not obtaining the lowest possible working costs in the

Three Head Steam Stamp Prospecting Mill.

mining and treatment. Miners are generous people. With a good dividend paying mine the tendency is to let generosity influence the business of mining in which it is entirely out of place. There is no commercial reason for dividing the profits of a mine with other business interests simply because it is a good mine and the profits are large enough to divide. It is this policy which in its time has been responsible for as many ultimate failures of good mines, as bad management has been for the failure of bad mines.

## The Price of Lead.

The recent conference in New York between the American S. & R. Co. and representatives of the lead mine operators of the Cœur d'Alenes, Utah, Colorado and Missouri, adjourned without any authoritative public statement of what had been agreed upon, though it was stated an agreement that was satisfactory had been made. It has been stated that the price agreed on between the parties was  $3\frac{1}{2}$  cents a pound, a reduction of half a cent. Several unconfirmed reports have stated that certain small differences in price were made as between the Cœur d'Alene mine product and that from Utah. It has been denied persistently that any immediate agreement to limit production was entered into, but this has been qualified by declarations that it was agreed to limit production if it should appear that the market was not absorbing the production at the existing rate. The statement is made that there is no present production in excess of consumption.

These declarations, some of which would appear to be optimistic from interest rather than the statement of facts, are neither luminous nor as a whole encouraging. The first clear light on the situation comes in the shape of a reduction in the New York market price of lead from 4.37 $\frac{1}{2}$  cents a pound to 4 cents. It would seem to confirm the statement of the  $3\frac{1}{2}$ -cent rate to the lead miners. The object of the cut in the New York price is stated to be the securing of an increased consumption for which a bid is made by stating that the price will be raised back to the old figure if consumption does not increase on trial of the experiment.

The difficult feature of the situation is the 40,000 tons of accumulated lead now owned by the smelting company. A mere balance between consumption and production will not relieve them of this. Only a reduction in production or increase in consumption can take this away. There hardly seems any reason to anticipate a materially increased consumption of lead. For the lead needed the price of 4.37 $\frac{1}{2}$  cents a pound has not been a restraining factor. As this journal has frequently stated, what is most urgently wanted is a new use for lead, or several uses, that will consume large quantities of the metal at prices that will pay a profit to production.

Despite optimistic views of some to the effect that

$3\frac{1}{2}$  cents a pound to the miner will not shut down any lead mine, it will probably shut down quite a number of mines. On 10% lead ore it means 50 cents a ton out of quite a small profit margin at the present price of 4 cents. With the silver price off 5 cents an ounce, the profit margin is cut from 50 cents to \$1.50 additional, and a lead silver mine which has been productive of a nice income to the operator and the community which divides his mine expense account, becomes unprofitable and has to be closed down.

Some of the large mines, the opening up and exploitation of which has been based on the theory that combination could maintain a high price for lead and silver regardless of the quantity of possible production, will feel the same pinch in net income. These may, however, have the opportunity of averaging down the loss by limiting the grade of ore mined.

The position of the smelter company is commercially better than that of the miners. Except as to the present accumulation of lead it need not make any loss on its smelting of ores for the mine operator, being, as one of its managers explained, "millers of lead ore." In a large way the smelter people are lead miners as well, and to the extent that they are, they have a commercial advantage over the other mine operators. Their ores have only to pay one profit, while the ores of other miners have to pay two, the first to the smelting people, the second to the mine operator.

Clearly with a narrowing profit margin in the business of making commercial lead it would seem as if the mine operators, now dependent on smelters, must in the end build and operate their own smelting and refining plants. How to accomplish this with many mines, no one large enough to support the type of plant which will be most economical, are matters of detail. It can be accomplished, when the business necessity of it is generally realized.

This adjustment to real condition is a matter of time. The price of lead is an affair of to-day. It is to be hoped that it will not be found necessary to establish a still lower price than  $3\frac{1}{2}$  cents. If the experience of the bad effects of combination in establishing a price that has become the incentive for an overproduction has no other cost charge but the reduction of the price to  $3\frac{1}{2}$  cents a pound, the lead miners have still some measure of good fortune.

PROBABLY nothing better illustrates the growth of the mining industry of this country than the great increase in the number of journals devoted thereto. Time was when there were but three in the entire country; this one, one in New York City, and one other. Now nearly every mining State and Territory has a strong well-edited journal whose mission it is to aid in the development of the basic industry of the nation. These journals differ in policy according to the ideas of their proprietors and the plane upon which they are run, but without reference to the openly corrupt element the most of them are earnestly striving for what they deem the best interests of the communities in which they are published. There is probably no class of trade journals among which more general harmony prevails, and while occasionally some of them energetically criticize a contemporary, it is with no other purpose than that the truth may be known and told at all times. So far as this paper is concerned it is always too much engrossed in the effort to be accurate itself to have any time or space left for noting the mistakes of others, its policy in this regard being actuated more by inclination than lack of opportunity. In all the 41 years of this paper's existence we do not remember one solitary instance of this paper criticizing any mistake of any of its contemporaries, and through the years many statements that appeared herein that at the time were contradicted and denied in contemporaneous publications, have later on been enthusiastically endorsed and defended by the same journals that at first derided and denied the facts.

THE progressive character of American metallurgy is strikingly illustrated in the case of steel manufacture. It is within the memory of men still young when the Bessemer process was hailed as the great cheapener of steel making and the creator of a new era in the world's industry. All that was said of it was deserved, but, so far as American metallurgy is

concerned, Bessemer converters are fast becoming obsolete. The process that revolutionized the steel business is being supplanted by the open hearth furnace; the continuous process is superseding the Bessemer converter.

## New Gold Mines in Old Gold Fields.

The mining summary, which appears in every number of this journal, has lately been recording the discovery of many new gold mines in the old gold fields, that it has been erroneously supposed had, to the miner of to-day, only a historical interest. This has been notably the case in the far West, in Arizona, Nevada, Oregon and California. Among these there is no favorite. Honest prospecting and good fortune have paid the same income of success in all of them. Nor has this notable character of mining development been special to these States more than to Colorado, Montana and Utah. In these three, the possible rewards to be gained by a second exploration of old districts once considered thoroughly exploited, was realized much earlier than in the States farther west. The present great mining developments of these three States, and very largely their notably great present mining districts, are the result of discoveries, beginning more than ten years ago, of new mines in old gold fields, and as well, of the discovery, that many of the old mines were in reality still new mines.

California, the oldest of the mining States, seems one of the last in time to begin the reporting of discoveries of such new mines. These new discoveries are of both placers and lodes—placer mines, that the old miners missed through supposing that the pay lead they had worked was worked out, and lode mines, where, because there were rich placer mines, it was supposed that there could not be any rich lode mines. The discovery of these mines is dissipating the belief that there were no mines to discover in these old places, and they are now being prospected for with persistence and intelligence.

The old placer gold fields of these States all originally obtained their gold from the breaking down of gold-bearing lode deposits. Unless the old placer miner actually found a gold-bearing lode in his placer working he was not likely to prospect for it. The old belief, which is by no means yet abandoned, was that the source of the gold was more apt to be distant than near by. The facts are quite the contrary, California only showing apparent—not real—exceptions, owing to the greater depth of erosion and more numerous lode systems.

The new miner does go into these old placer gold fields and in many instances finds new placers and in more instances new lodes. In some cases the lode source of the placer gold is found to have been the bedrock of the placer itself. This bedrock may, or may not, be rich enough in gold to be commercially utilizable, but this is a matter of special investigation in each case. What the miners in a general way designate as "porphyry" is a type of bedrock that it is always well to examine closely. The rock may be one of several distinct types of eruptive rocks. The gold may be in the mass of it, invisible to the naked eye, or it may be in fine, knife blade seams of quartz or lime spar, filling joint and fracture planes. Such gold-bearing rocks usually carry pyrite, which, oxidized at the surface, hides the true character of the rock and is misleading where the eye is depended on alone for conclusions as to metal-bearing value.

The preceding is one source of placer gold that may be a lode mine. Another is in near by quartz mines separated from the old placer ground by steep eroded surfaces on which placer gold in paying quantities is not collected. These ledges may be capped by soil or detrital accumulations, but their possibility is nearly always an estimable quantity by the prospector. Iron caps or gossan deposits also hide values that are close to the old placers.

So great a measure of success is attending on this character of prospecting, and mechanical appliances by which low gold values in rock are made commercially utilizable are so improved, that all the old gold fields, particularly the old placer gold fields, should be looked over for new mines. The verdict of the past as to the facts or as to commercial availability should not be regarded as conclusive. In the end it may prove that it can be said, "Once a gold mine, always a gold mine."

## Concentrates.

THE relocater of a mine can not hold the mill if it is on a separately located millsite.

PURE WATER possesses high resistance to an electric current, but the slightest acid admixture reduces such resistance.

THE total oil tankage in the Kern river, Cal., oil field, including that under construction, is said to be 1,996,000 gallons.

AN alternating current dynamo can be converted into a continuous current machine by replacing the collecting rings with a commutator.

FRICITION is the resistance occasioned to the motion of a body when pressed upon the surface of another body which does not partake of its motion.

PLATINUM occurs in the Sudbury, Ontario, mining district as sperrylite, which is a combination of platinum and arsenic found in the gossan of the Vermilion nickel mine.

A FRICTION CLUTCH COUPLING 32 inches diameter, at 100 revolutions per minute will transmit 40 H. P.; at 200 revolutions per minute, other conditions being equal, it will transmit 80 H. P.

A 6 H. P. GAS ENGINE will use about 18 cubic feet illuminating gas per hour for full load, gas and air inlet being correctly adjusted. A good governor on the gas inlet will save waste.

REGARDLESS of diameter, in the case of a pump having a 3-inch discharge pipe bushed down to 2½ inches the pressure on the valves remains the same so long as the diameter of the valves remains unchanged.

RELINQUISHMENTS can only be made before issue of patent. A deed or relinquishment of a part of a patented mining claim would not throw the part so relinquished into the unappropriated public mineral domain upon which mining claims may be located.

THE law in Colorado rightly requires that any one milling, sampling, concentrating, reducing, shipping or purchasing ore must keep a record of the shipment and all related data. Thus a check is put upon the possibility of the practice of dishonesty in connection with the shipping and treating of ore.

HIGHLY SKILLED MINERS and other workmen employed in the Johannesburg, Transvaal, mines are gradually returning. There is a demand for more of them than have yet gone back. The Government is still limiting the number that are permitted to return, but is rapidly removing the restrictions.

THE quantity of sodium delivered to the sea every year by rivers is about 160,000,000 tons; but the quantity of sodium which the sea contains is at least ninety millions of times greater than this. The period of time during which rivers have been carrying sodium into the sea must therefore be about ninety millions of years.

SEAMLESS TUBING is made by subjecting a solid steel rod to a rotary motion under heavy pressure produced by several rollers, the axes of which are set at an acute angle with the axis of the steel rod. The center fiber is opened, making a hole into which a mandrel is inserted, which will expand the opening and make it of uniform circular diameter.

THE Supreme Court of Pennsylvania, in a case against the Lehigh Coal & Navigation Co. for discharging mine waste into a stream on which the plaintiff had a water power mill, has affirmed a judgment for damages and a permanent injunction given by the trial court. The decision, which the court bases on the Pennsylvania statutes and the common law, is regarded as establishing the rule for that State.

FERRO-CHROMIUM is commercially manufactured from chrome iron ore in an electric furnace. Cheap water power is desirable. All the chrome iron ore now handled in the United States in the production of ferro-chromium is imported from Turkey. The California ore might displace it if it was manufactured into ferro-chromium on the ground and the cost of transportation of useless matter was thereby saved.

ONE who buys mining stocks should know the capitalization of the company and the proportion the stock he buys bears to the total capitalization. A large number of shares may be so insignificant a fraction of the total capitalization that the sum paid for the stock is out of proportion to what is bought with it. A corporation with \$50,000,000 of capitalization on paper and no real property assets is not likely to prove a paying investment.

A "BAG HOUSE" in connection with a smelter is a large building through which pass all the smoke and gases on their way to the stack. The building is lined with large wooden "bags," and the fumes pass through these bags, saving all the fine particles of gold and silver. The American Smelting & Refining Co.'s "bag house" at East Helena, Montana, saves \$25,000 annually of metallic values that otherwise would pass away in the smoke.

A CHEMIST and a laboratory are now necessary adjuncts of many manufacturing businesses. It pays to have such scientific appliances. Take, for instance, a large brass foundry buying thirty tons of copper per month. The chemist would earn a good part of his salary were he to show that the purchased copper contained, say, 1½% zinc. Of course, zinc would be added

anyhow to make the brass alloy, but the difference between thirty tons of copper per month, of pure metal, and thirty tons with 1½% zinc would represent in New York over \$1500 annually. And so it is in other metallurgical operations.

AMONG the advantages of electrical over mechanical transmission are the ability to shut down departments without interfering with the main power transmission; the ability to arrange machinery regardless of the lines of the building, thus obtaining efficient grouping and effective lighting; freedom from shut down caused by breaking of main belts; lessening fire risk by abolition of vertical openings through floors, made necessary by vertical belts; instantaneous response to sudden demands for power, and the ease with which additions can be made.

WHEN silver is immersed in mercury there is produced at the surface of the former metal an extremely thin layer or film of amalgam which arrests the ulterior action of the mercury. This is believed to be the reason why grinding is so requisite in the amalgamation of silver ores, as the adherent coating of amalgam is removed by the friction, fresh surfaces of silver being exposed to the mercury. In like manner, clean siliceous sand assists amalgamation, while clay or any other substance which increases the viscosity of the pasty mixture hinders the amalgamation.

TO TEST quantitatively for the presence of gold and silver in the solutions with potassium cyanide as a solvent at any stage of treatment, take 500 cubic centimeters of solution, heat nearly to boiling point, add two grams sulphate of copper and two grams sodium sulphide; add hydrochloric acid so as to have a strong acidity; heat to boiling point; filter the black precipitate in which the gold and silver are retained; scorch the precipitate with fifty grams litharge. The gold and silver are recovered from the lead by cupellation. The sodium sulphide used in this test may be made by fusing in a crucible one part of carbonate of soda and one part of sulphur. The crucible must be well covered.

MECHANICAL FORMULAS relating to the strength of materials and the strains and stresses to which use subjects structures, are not absolute. They are largely compromises. In their application a margin is always provided to protect structures built in conformity with them. This is called the factor of safety. Better knowledge and better methods are tending to make this factor less a matter of guessing. One use of it is, for example, to provide for the deterioration of metal which in time uses up the safety margin. To limit this, investigation is being made, both to reduce the rate of deterioration and to determine what that rate is. To structures then, on which only static strains come, a much lower factor of safety will be a safe factor, and it becomes possible to save material and its cost.

FULL PAID STOCK is stock for which the company has received full value at the time it is issued. The term has no relation to the market price. The law contemplates that stock may be paid for in installments, and when the last installment is paid, it is full paid. Under the practice in Colorado, the stock is frequently issued full paid in payment for property conveyed to the company in consideration for the issue of stock, and to the value thereof. Assessable stock is stock, the holder of which is liable to pay assessments levied by the company and upon non-payment of such assessment properly levied, the stock may be, by proper procedure, sold to pay the assessment. Non-assessable stock is stock against which the company cannot levy assessments. The stock of any California corporation is subject to assessments.

Any person who makes the required deposit to the credit of the Treasurer of the United States for office work in the office of the United States Surveyor General and files in that office a certified copy of his location notice, with his application for survey and certificate of deposit, can procure an order for the survey of his claim, and the surveyor appointed to make the survey will be required to certify in the field notes of the survey that a mineral-bearing lode or vein exists. It would not be possible to have the survey approved unless evidence showing this to be a fact is presented to the Surveyor General, and unless the deputy surveyor reports that at least \$500 has been expended in labor and improvements. If the report of the deputy surveyor is not sustained by the facts in the case, the proper course to pursue is to attack the claimant's application for patent.

TO case-harden steel with cyanide of potassium, the piece or part of steel to be hardened is first coated with a protecting mass that is able to resist the heat, and thereafter cyanide of potassium is strewn upon that coating, whereupon the whole is put into the fire. The piece thus treated is then quenched. Instead of using only cyanide of potassium some use a mixture of this substance with coarse salt. By treating the steel in this manner is obtained in the same way a uniform structure, which is not changed when the steel is cooled down. This feature is particularly important in the case of machine parts and the like. The coating consists generally of purified chalk and varnish; but the chalk may be replaced by clay, oxide of zinc, and other substances that do not burn down in the fire. The oxide of zinc may be mixed with file shavings of lead, when a solid crust will be obtained, resulting from the melting of the lead. When the steel to be hardened, after having been coated with the protecting mass, is heated, together with this mass, the varnish, that merely forms a kind of a cement-

ing medium, burns and a hard, porous cover remains. During the further heating of the steel with this hard, porous cover, the cyanide of potassium strewn upon that cover passes into and through the pores of the latter and distributes its action uniformly upon the surface of the steel. When using a mixture of cyanide of potassium and coarse salt, both substances are employed in equal quantities, the quantity of the whole mixture being, of course, dependent upon the size of the pieces or parts of steel to be hardened, or of the extension of the surfaces of same, respectively.

A CO-OWNER in a mining location can not lawfully prevent the other co-owners from doing the annual assessment work required by law. If he has himself performed the assessment work it protects the claim from forfeiture regardless of whether or not the other co-owners do any assessment work. If he has not done the assessment work and he, by force or otherwise, prevents the other co-owners from performing the work the claim becomes forfeit. The remedy of the ousted co-owners is through the courts by a restraining order directed to the opposing co-owner to keep him from interfering with the others doing the work. A co-owner representing to the other co-owners that the assessment work had been performed, whereas it had not, can not, when the claim becomes forfeit, relocate it, either directly or through a third party, for his sole use and benefit. Any such relocation inures to the joint benefit of all the co-owners.

WHILE we know that the earth is a magnet, no one is able to say what makes it so. The fundamental secret of terrestrial magnetism has not been solved. Then, too, there are various changes in direction which mark the behavior of the needle that remain to be explained. These questions are often asked: "What influence is it that makes the needle swing to and fro to a microscopic extent every day? Why is it that the diurnal swing is greater in years of sun spot abundance than at the minimum stage of solar activity? Why do the indications of the needle differ in summer from those of winter? What is the key to the mystery of the long period movement that makes it necessary to rechart the situation? What causes the convulsive behavior of the magnets for a few hours or days when there is a great out-break of sun spots? And is there any relation between the weather and the fluctuations in the earth's magnetism?" There are theories on these subjects, but no generally accepted doctrines, but the human mind is so constituted that it will not rest until further light is obtained.

THE U. S. Mint gives in exchange gold coin for gold bullion, no charge being made for the coinage of the bullion; but a charge is made for the copper added in making an alloy of the proper standard, or 900 fine, that being the fineness of both gold and silver coin. All unrefined gold bullion, unless it be foreign coin, must be refined or parted, for which a charge is made in accordance with the fineness of the metal. Upon fine gold—that is, bullion over 990 fine in gold—no parting or refining charge is made. Seigniorage is the actual difference between the face value of the coin and the market price of the metal in the coin. As the market price of the gold in a gold coin equals its face value, there is no seigniorage upon the coinage of gold. In all U. S. silver coins it is different. In the silver dollar, containing 412½ grains of metal, 371½ grains of which is pure silver, if the market price of an ounce (480 grains) of silver is 60 cents, and the Government puts in the dollar 371½ grains of silver, then the difference between the market value of 371½ grains of silver and the amount of silver which the dollar will purchase is the seigniorage.

THE accumulation of amalgam on copper plates, like other mill matters, is largely resultant from the ore treated. In the case of some sulphide ores the amalgam has a tendency to form hard scale on the plates, which cannot be removed with a rubber scraper, whisk broom or any such tool. But with a steel scraper the scale can be broken through and cracked off like a layer of dry putty, and this, if done properly, leaves the plate with a soft and satiny amalgam surface, if anything, better, for catching gold, than the uneven surface of harder-scaled amalgam. The use of the steel scraper is necessary with inside plates, where the scouring of the heavy mineralized pulp seems to harden all the amalgam. Amalgam which forms hard scale on the plates yields bullion finer in gold and lower in silver than the softer variety, and it is generally obtained from ores carrying comparatively coarse or flaky gold. Possibly only the coarser gold tends to form hard amalgam scale on copper plates, so that while in some ore the native silver is the coarser, in other instances, where native silver is almost unknown, scale can only form from ores carrying coarse gold. The increasing proportion of silver to gold in the amalgam caught farthest from the battery is of common occurrence. The old plates should be thoroughly scoured for several hours with sharp sand from the tailings, hot water and quicksilver. The loosened amalgam could then be removed (after washing off the sand with hot water) with a rubber scraper in the ordinary way, leaving the plate with a good, soft surface of amalgam, in excellent condition for further use. Considerable difference lies in the mode of cleaning the plates, and especially in the use of the steel scraper. This tool can be used so as to ruin any plate, but in proper hands it is indispensable to the millman. The scrapers used in the district around Central City, Colo., are made from 1½ inch steel, about 3 inches wide, ground square across, so as to give two right-angled edges.

## Some Principles Controlling the Deposition of Ores.\*

By C. R. VAN HISE

This paper is intended as the closing reply to comments on the author's previous papers on the same subject. It appears that, so far as the classes of ore deposits are concerned, there is no difference of opinion between myself and Prof. Vogt and Dr. Lindgren. We all agree that the class of contact deposits exists; that the source of the ores of such deposits is largely the igneous rocks; and that during the concentration of the ores a high temperature prevailed. The difference of opinion occurs in the interpretation of particular cases. Prof. Vogt and Dr. Lindgren, but more especially the former, hold that many ore deposits, including sulphides, are more closely allied to the igneous rocks than to water deposits, while I hold that the majority of ores, as shown by their character and relations, are deposited by underground waters. However, I have distinctly recognized that there may be deposits in which it is difficult to say which of these two agencies predominate.

But in the vast majority of cases there is little difficulty in discriminating between veins and dikes, the first representing crystallizations from water solutions, the second crystallizations from magma. There are few cases where the discrimination with reference to ore deposits is not easy. While gradations between water-deposited ores and igneous ores are uncommon, gradations between the different classes of ore deposits formed by underground water are common.

Concerning pneumatolitic action as an auxiliary in the formation of ores, as held by Vogt, Lindgren, Beck and Kemp, I do not deny the existence of ores of this class, but simply say that, while ore deposits produced by this process are theoretically possible (and very likely exist) I do not know of any instance in which it has been shown that pneumatolitic action has actually been a dominating factor in the production of a workable ore deposit. However, I think it not unlikely that pneumatolitic action (in the sense of water gas under very high pressure, above the critical temperature of water) may have helped in the segregation of the metals by transporting them to the main channels of water circulation. This condition of the water I distinctly recognize as producible not only by igneous rocks, but also by dynamic action. But discrimination should be made between what may be true and what has been shown to be true. The presence of such so-called contact minerals as tourmaline and fluorite, holding such elements as boron and fluorine, is not proof that they and the other minerals in the veins containing them were not deposited by heated circulating waters.

From the proposition that igneous rocks are an important source of the ores, and that the ores are extracted from them by circulating waters, it by no means necessarily follows that this work is chiefly done while the rock is a fused liquid mass. After the rocks crystallize and become partly cooled, deformation and the cooling itself may produce many fractures in them, thus furnishing channels through which the hot waters course while they are collecting the metals. In this manner is largely explained the difficulty under which Prof. Kemp labors in understanding how circulating waters may work upon hot igneous rocks. So far as igneous rocks are deep-seated intrusives, they may retain after crystallization a very large part of the water which they previously held. This is evidenced by the innumerable liquid inclusions in many such rocks.

In this connection I may say that, among the papers presented in this discussion, Lindgren's admirable paper upon metasomatic processes in fissure veins seem to me wholly to confirm the view that the deposition of most metallic deposits is effected by underground water. The metasomatic changes in the rocks which Dr. Lindgren describes occur not only in the veins themselves, but in the walls of the veins. Moreover, in many cases the amount of change decreases in passing from the walls into the veins. During the metasomatic changes metals were added and subtracted. Lindgren declares that, in the great majority of these cases, the chief agents through which the metasomatic changes were accomplished were circulating waters. He concludes, further, that the waters were probably hot; that those which originally deposited the sulphide constituents were probably ascending; but that the ascending waters are chiefly of surface origin. Therefore, in all these matters, by his exhaustive study of the metasomatic processes in the veins, Dr. Lindgren fully confirms my most fundamental contentions.

It is noteworthy that Prof. Vogt and Dr. Lindgren, with admirable scientific restraint, notwithstanding the beliefs which they hold, discriminate clearly between the few cases in which they have shown a probability that the ores are the products of igneous action and the far more numerous cases in which the evidence of such origin is very scanty or wanting altogether.

Thus Prof. Vogt recognizes clearly that the attribution of the larger class of these ores to igneous

action is purely hypothetical. He fully appreciates that, of the great majority of ore deposits, he has wholly failed to show that igneous agencies have separated the ores from the original rocks and placed them in their present positions. This connection must be made before the hypothesis advanced by Prof. Vogt can hope for acceptance. Since the majority of the ore deposits thought by Prof. Vogt to be possibly due to "contact after action" in some other sense than segregation by underground water differ in no essential particulars as to their character, the minerals they contain, the relations of these minerals to one another, the relations of the ores and minerals to the surrounding rocks, the presence of crustification, and other features, from ore deposits which many authorities, including Prof. Vogt, recognize as deposited by underground water, I shall hold to the old view that they are the results of water deposition until evidence is presented showing the contrary. To attempt to prove the proposition that these ores are deposited by water would require the repetition throughout of the arguments for such an origin which have been presented during the past half century by nearly all of the famous men who have discussed ore deposits. If these arguments are not adequate to convince the reader, I cannot, in closing this discussion, present the case more fully, but must defer the matter until the publication of my treatise upon "Metamorphism," in which I consider much more fully the circulation and work of underground water, and the character of the deposits produced by that agent.

If it be recognized that, in the majority of the cases cited by Vogt and Lindgren, the materials of the ores were transported and deposited in their present positions by underground waters, it makes no difference to me whether such ore deposits be called contact deposits, hydro-thermal deposits, dynamic metamorphic deposits, or regional metamorphic deposits, as proposed by Lindgren.

Dynamic action may increase the temperature of the underground waters, and make the conditions much more favorable for the deposition of ores. If in the first part of my paper, discussing general principles, I have not made clear my belief in the extreme efficiency of hot water, as compared with that of cold water, in the segregation of ores, I have failed altogether to convey my ideas. I fully recognize the remarkable relative potency of hot water in all classes of alterations of rocks, including the deposition of ores. I emphasize especially the effect of high temperature, (1) producing a deeper circulation, (2) in producing a more rapid circulation, and (3) in very greatly increasing the power of water to do chemical work of all kinds.

Further, I strongly make the point that both the speed of solution and the amount of material which may be taken into solution are greatly increased by high temperature, and in proof of the efficacy of hot water in the production of ore deposits, I cite the Cordilleran region of the West as one in which the temperature of the water is higher than normal, and in which ore deposits are common.

In conclusion as to this portion of the discussion, I would say that, while I think I have given adequate weight to igneous rocks as a source of the ores, and to the resultant hot waters as an agency in their concentration, I have not elaborated that branch of the subject. The reason is, that these ideas are not new, but have been generally accepted for decades by all who have written upon ore deposits. A complete treatise upon ore deposits should, of course, give proportional representation to all parts of the subject; but a paper on the subject necessarily covers the new ground most fully; and if, in addition to this, it puts new material in proper relations and proportions to old material, that is all that can be fairly expected.

I have reserved for separate consideration most of the points raised in Prof. Kemp's paper upon "The Role of the Igneous Rocks in the Formation of Veins," with the arguments and conclusions of which I am not in such general agreement as with those of the other papers named. I shall state the points both of agreement and of difference between us; and, I need hardly say, with entire personal esteem and respect for Prof. Kemp. But my position is rendered somewhat embarrassing by the circumstances that this contribution closes the discussion, so far as it is to be published by the Institute in the special volume now in press.

1. From the frequent occurrence of ore bodies in regions of vulcanism, it does not follow, as held by Prof. Kemp, that the igneous rocks are the sole source, or, in some cases, even an important source of the ores. As pointed out by Prof. Le Conte many years ago, and as shown by me, "the undoubted occurrence of workable ore deposits in regions of vulcanism may be explained by that heat furnished by the igneous rocks, this promoting the work of the underground solution." I have already emphasized the enormously increased activity of solutions with rise of temperature. In the neighborhood of igneous rocks the underground solutions are hot, and these hot solutions may, and in many cases, I believe, undoubtedly do, derive a large part of their metallic material from the sedimentary or metamorphosed rocks, although, as indicated in my original paper, I maintain that probably the ultimate source of all the

ores, and very frequently the chief or sole immediate source, has been the igneous rocks.

2. While Prof. Kemp would derive the majority of ores from igneous rocks, he declares that surface flows of such rocks are unfavorable to vein formation. But, to give a single instance to the contrary, the Lake Superior copper deposits were shown by Pumpelly, years ago, to occur in or associated with surface volcanic rocks. I think the true statement is, that very recent volcanic flows have not had time enough for the development of contained or connected ore deposits; or else, they have not been eroded deeply enough to expose such deposits, if they exist. But it would be rash to say that ore deposits are not even now forming in the middle and lower parts of the great lava flows of the plateaus of the West. Indeed, I think it highly probable that such formations are going on, and that at some future period the resulting ore deposits will be at the surface.

3. In asserting the existence of gradations between pegmatite and quartz veins, I am glad to find Prof. Kemp in full accord with me. I pointed out such gradations some years ago, and, as already explained, advanced as the explanation that water and rock, at sufficiently high temperatures and pressures, are miscible in proportions.

4. From Prof. Kemp's statement that "practically all students of volcanic phenomena are agreed that steam and its dissociated representatives in the molten rocks are the chief, if not the only, cause of eruption," I must wholly dissent, holding with Dutton and Gilbert that, in areas of regional vulcanism (which are those containing the most extensive ore deposits), gravitative stress is the dominant force producing eruption, although it is agreed that steam plays a subordinate part, and an important part in local vulcanism.

5. Perhaps I do not fully appreciate Prof. Kemp's arguments concerning capillary attraction as connected with the movements of underground water. Prof. Kemp says that the imperviousness of strata is partly due to the "feebleness or disappearance of capillary attraction with increase of pressure." Later he says: "Whenever, for example, capillary transmission occurs, the previously acquired head is lost, and the emerging water proceeds on its way only under a newly accumulating head." Further, he says that "capillary attraction is largely an ascensive force." I am uncertain whether or not Prof. Kemp intends to imply that I have advocated the view that capillarity is an important force, which accounts for the circulation of groundwater in the belt of saturation. As a matter of fact, I have not appealed to the force of capillarity in any way whatever to explain the circulation in this belt. It seems to me that Prof. Kemp has wholly failed to recognize the great difference in the nature and forces which control the circulation of water in the belt of weathering, above the level of ground water, and the belt of cementation, below that level. Above the level of groundwater the force of capillarity is important in the movement of groundwater. This matter I shall discuss fully in my treatise on Metamorphism, but cannot take up here, as it is a complicated one. Below the level of groundwater, the size of the openings, as I have fully explained, is of very great importance in the movement of the underground water, because friction runs up very rapidly with subdivision of the openings; but how capillarity is a "descensive" or "ascensive" force in this belt, I am at a loss to understand.

6. Prof. Kemp does an unintentional injustice when he cites me as supporting "the views that hot springs are the result of normal terrestrial circulations, without accessions of heat other than those which would be received through the ordinary increase of temperature with depth." I refer the increase of temperature of the underground waters to the normal increase of temperature with depth, to vulcanism, and to dynamic action. Regional vulcanism and orogenic movements I mention twice as producing high temperature.

7. But I held, and still hold, that difference in temperature of the ascending and descending columns is a cause which works in the promotion of circulation as an adjunct to the main cause, heat. Prof. Kemp argues against this conclusion, but his argument seems to me to be unsound, for the following reasons: a. Since I emphasize vulcanism and orogenic movements as chief causes of high temperature in underground water, the depth, and therefore the pressure, may be but a small fraction of that assumed by Prof. Kemp. b. The only experiments which I have found upon the compressibility of water at high temperature are those of Barrus, in which he finds that the compression resulting from the pressure cited by Kemp is much less than would be necessary to neutralize the expansion due to the heat mentioned. c. Admitting for the moment that the pressure does neutralize the expansion due to heat, since the pressure is nearly the same upon both the ascending and descending columns, and inasmuch as, under the hypothesis, there is a difference in temperature between the two columns, there would be a difference in density, and therefore a cause for flowage.

8. Upon another point connected with the circulation of underground water, Prof. Kemp says: "We must bear in mind also that the standing body of cold groundwater fills the interstices of all rocks, except

\*Abstract of paper read before the American Institute of Mining Engineers, Mexican Meeting.

those in very arid regions, and exerts a retarding influence on uprising currents." I am entirely at a loss to understand how the coldness of the water prevents circulation due to difference in head and difference in temperature of the two columns, except as to an effect which I have emphasized, namely, that due to varying viscosity.

I, of course, maintain that the best energy of the igneous rocks passes into and thereby expands the water, thus causing a difference in density between the ascending and descending columns, and thereby promoting circulation. But Prof. Kemp has thrown this use of the energy act in producing a circulation, unless it be by heating and thereby expanding the water, he does not explain.

9. Prof. Kemp says that "standing water in abandoned shafts is strong evidence of the impenetrability of rocks." This seems to me untenable. Such standing water has come in either from the surface, or through the "impenetrable rocks." The latter hypothesis Prof. Kemp rejects. But if the former be true, why does not the water rise with periodic additions? According to my view, standing water in shafts, exactly as in wells, indicates the upper limit of the belt of saturation. But the standing water maintains its uniform level (in the absence of pumping) by flowage through the rocks, compensating the local additions or subtractions. Certainly the water standing in the wells of the drift covered regions of North America does not prove that there is no active underground circulation in the drift.

(TO BE CONTINUED.)

### Mine Electric Bell System.

Written for the MINING AND SCIENTIFIC PRESS by E. M. KIRK.

The following method of electrically operated bells is used in some of the large mother lode mines in California for the purpose of signalling from the shaft to the engineer at the hoist.

Five gravity cells are set up in series in a box at some station or level in the lower part of the shaft, out of the way of water and where they will not be disturbed. Two No. 8 galvanized iron telegraph wires are strung from top to bottom of the shaft. They are placed parallel about 4 inches apart and are supported on porcelain insulators fastened to the shaft dividers or uprights. Insulated wire completes the circuit from the collar of the shaft to a relay in the hoisting works, and also from the batteries underground to the shaft wires at the bottom.

In the hoisting works an Edward's electro-mechanical gong, which strikes single blows, is connected to four Fuller cells through the relay armature. Instead of the Fuller cells, connections can be made directly to an incandescent light circuit, but if so it is best to have six Leclanche cells in reserve in case the current in the light circuit is cut off temporarily.

The bell is rung in the shaft by holding the wires between the fingers of one hand and drawing the blade of a miner's candlestick held in the other hand between the wires. In shaft sinking it is handier to have a push button and length of incandescent lamp cord reaching from the lowest set of timbers to the bottom.

As the bell can be rung by touching the two wires with a candlestick, a man on the skip riding up or down at full speed can stop it instantly at stations or anywhere between levels.

At mines where one compartment is used exclusively for hoisting miners, this system, on account of its convenience, should be used in addition to the mechanical pull bell.

### Shaft Sinking on Veins.

In the prospect stage of a mine's life history, the custom of sinking on the vein or deposit, by starting work on the outcrop, has too often the result of producing a shaft with different degrees of the angle of dip, when the vein departs from the vertical. The limited means of the miner in many cases makes this manner of sinking necessary, coupled with the desire to produce ore, and also to learn the nature of the deposit. When such a shaft comes to dip at any angle between 10° to 30° from the vertical with a change of grade, the operation of hoisting becomes slow, dangerous and expensive, through the desire to follow the windings or inequalities of the vein. To make such a shaft safe and more easily operated, by making it of one grade, or nearly straight, is at best expensive for timber and often not possible. To operate a shaft of uneven grade between the angles already mentioned, where it is not desired to sink a new one in another place and use the first for an air shaft, the disadvantages must be overcome by the use of guides in such a case of change of grades, is to bolt in place a railroad rail on each side of the shaft, and as these can be fitted or bent to suit the change of dip or angle, they form strong, continuous smooth guides, on which the bucket frame or skip can be made to avoid striking the foot or hanging walls. By placing two small wheels above the rail, and two under it, one each side of the frame of the bucket or skip, the load is held at all places in the center of the shaft. It seldom happens that a prospect shaft makes a good working shaft, unless it is vertical or dips at a flat

angle when it is sunk on the dip of the deposit. The desire of the owner to follow a rich seam or stringer of ore is the chief cause of the trouble, as funds will not always permit of sinking a working shaft in the prospect stage of the mine, irrespective of the grade of ore found. In sinking a pitching or incline shaft, the constant care of the foreman has to be exercised to see that a uniform angle is sunk on by the miners.

### A Water Conduit for Power Plant.

Written for the MINING AND SCIENTIFIC PRESS by LUTHER WAGONER, M. E.

The topography of the Sierra Nevada mountains in California has made possible the use of water for power development under extremely high heads. In one instance a water pressure from 1400 feet of head is being employed, and a plant to use 1700 feet head has been projected.

Where the quantity of water used is comparatively small, the construction problems have presented no special difficulties; but the increasing use of very large volumes of water under very high heads has made the cost of installation of the water power plant a matter requiring much more consideration than with the smaller plants.

The writer, associated with Mr. J. R. Price, C. E., was lately called on to plan the construction of a large power plant, utilizing the water of the North Yuba river, in Yuba county, Cal. The plans provided for the utilization of 315 second feet of water with a drop of 1000 feet from the intake to the water wheels in a distance of 4000 feet. A single pipe to carry this quantity of water would have to be 7 feet in diameter and it would require a thickness of metal at the lower end of 1½ inches, which is not practicable. The method generally used in California under such conditions would be to divide the water among a number of pipes, so as to reduce the thickness of the metal. Assuming ¾ inch as the limit of thickness for riveted work, and taking the working strain for the iron at 12,000 pounds, there would be required to carry the water three pipes of 48 inches diameter. The metal for the three pipes would weigh about 2100 tons, which would cost in place about \$240,000, exclusive of the drum and branch pipes to the wheels in the power house. To avoid this heavy cost and insure a safer construction, and a saving of 1.2% of the power from loss as extra friction in the three pipes over what it would be in one, we devised the following plan of construction:

The country rock along the slopes from the intake to the power house is a firm, massive diabase, and it is only a short distance from the surface to solid rock. At the power house it would be proposed to excavate down to the solid rock for a foundation and to sink a circular shaft, say, 100 feet deep, in the rock. From the bottom of this a drift would be run each way under the power house. Also, there would be run an inclined upraise about 8 feet in diameter, parallel to the surface of the hill slope a distance of 4000 feet to the intake end of the conduit at the head box on the canal. This upraise would be constructed through several short adits from the hill slope, which would later be closed with concrete next to the upraise. The upraise would be lined with a sheet steel lining ¼ inch thick, made in 6-foot lengths, to slip joint in place after being well dipped in asphaltum. The space between the outside of the pipe and the wall of the rock would be well rammed with concrete. The purpose of the light pipe is to prevent leakage. Re-

liance is had on the solid rock and the concrete filling for strength to resist the static pressure.

Under the power house a similar construction of thin metal pipes in concrete backing to the solid rock will divide the main into three vertical 48-inch pipes, which will rise about 50 feet from the short drifts described above, and then branch into two 30-inch diameter, lapwelded and flanged pipes, which will enter the power house through the floor and deliver water to the wheels.

The plan would provide a construction which the accompanying sketch will illustrate. It would seem to eliminate the possibility of accident to the water conduit line. The cost of this work complete we have estimated at about \$126,000, as against \$280,000 for three 4-foot pipe lines laid on the surface in the usual manner.

Mohave County, Arizona.\*

[STAFF CORRESPONDENCE.]

The Tennessee mill has been operating on about ninety tons of ore per day, making a concentrate that runs about 65% lead, with fair silver and gold values. The material passes through crushers, two sets of 14x27 Davis rolls, revolving screens, hydraulic classifiers, jigs and concentrating tables. The slimes from classifiers pass to the tables. The five sets of jigs make 20, 15, 10 and 3-mesh products. One set is of the Hartz pattern, the others being of the drop-motion style. The tailings from all are settled in tanks, from which the water is pumped to the head of the mill for use again.

At the Elkhart a new shaft is being sunk at a point about 2000 feet north of the old shaft, and is now to a depth of 200 feet. The old shaft is over 500 feet deep, and the new one is to open and develop the same mineral belt farther north. The Elkhart mill, which has been idle for the past year, is being put in condition to operate. A considerable tonnage of ore is ready for the mill. Present work is in charge of Supt. Scrutton.

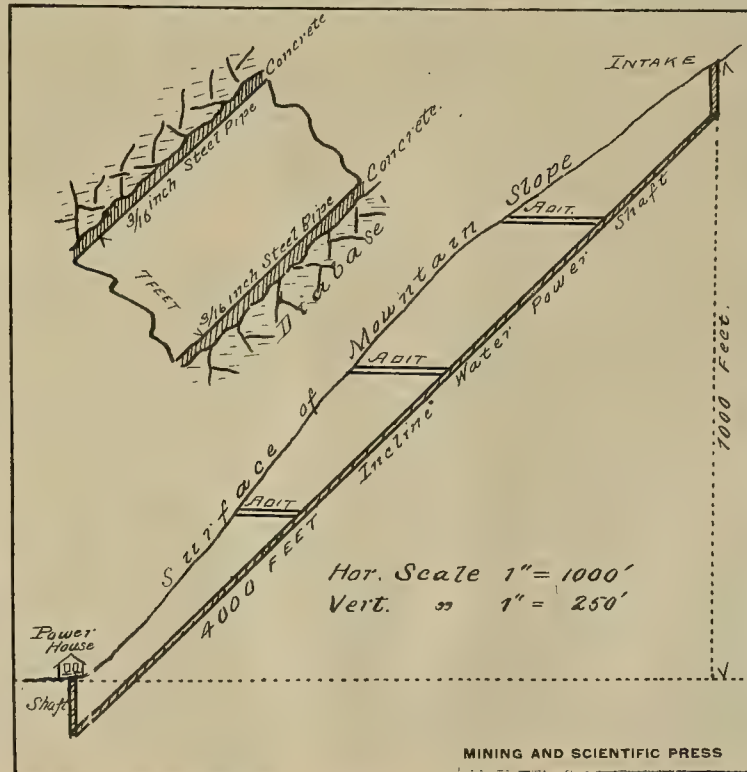

The Schuykill group, lying between the Elkhart on the north and the Tennessee on the south, now belongs to the Southwestern Mining & Reduction Co., development of the property being in charge of Manager W. D. O'Neil. A steam hoisting plant has been installed and a shaft sunk 525 feet to one side of the ore body; crosscuts will now be run to the ore from the different stations. This company has erected necessary buildings.

The Rainbow group, near Chloride, belonging to A. M. MacDuffee, has produced since it was opened about \$75,000, chiefly from the oxidized ores above the 100-foot level. Present workings are in the sulphides. The Rainbow vein parallels that of the Lucky Boy, near the top of the Cerbat range. Mr. MacDuffee reports that 2000 tons shipped ran three ounces gold, twenty-five ounces silver and 10% to 15% lead.

The Philadelphia-Arizona M. Co., owners of the Minnesota-Connor group, has its new mill well along toward completion. Its power plant comprises three high-pressure steam boilers, 100 H. P. each, provided with crude-oil burners and including Cochran heater and separator, so as to utilize the exhaust steam. This plant will operate a Corliss mill engine, hoisting engine over the shaft and a dynamo for light. Above the mill is a cemented water reservoir with 240,000 gallons capacity; and oil tanks having capacity for three carloads of oil. The mill equipment provides for different phases of concentration. It includes crusher, shaking screens, 14x27 sets of rolls, elevators, trommels, four sets three-compartment jigs, hydraulic sizers, Bradley grinder and a number of Wilfley tables and Frue vanners. The idea is to make jig products of different sizes, a middling product on the Wilfley tables and a slime product from the Frues. These different products pass to the shipping bins, where there are facilities for drying them by heat from the exhaust steam. The capacity of the mill will range from 200 to 250 tons daily.

The ores from the Minnesota-Connor comprise an iron, lead and copper sulphide, carrying gold, silver, lead and copper values. Manager E. T. Loy states that it will run about \$10 gold, fifty to seventy-five ounces silver, 30% lead; that there are streaks of white iron in which the values run five to nine ounces gold and high in silver. There is found considerable of native silver and silver glance; also,

\* See illustration on front page.

MINING AND SCIENTIFIC PRESS

streaks of antimony and arsenic, which, with the silver, forms ruby silver. The copper is said to be pretty uniformly disseminated through the ore, running from 7% to 15%. The high grades from the mine—running from \$100 to \$200 per ton—are to be shipped direct. That designated as mill ore will doubtless run from \$12 to \$20 per ton. The veins here run northwest and southeast. Mr. Loy says sufficient ore is blocked out to employ the new mill for a year.

The Lucky Boy, which belongs to T. B. Scott, has shipped a considerable tonnage of high-grade gold and silver ore and is undergoing further development, and is said to have considerable blocked out.

Chloride, Nov. 30.

WASCOTT.

### The Magnetic Concentration of Ores.\*

As early as the beginning of last century physicists had noted the magnetic properties of other substances than those easily attracted by ordinary magnets, such as iron and magnetite. Faraday carried on a set of very exhaustive experiments, making use of the most delicate physical apparatus, the results of which he published in 1846. He showed that all matter, solid, liquid or gaseous, was magnetic, i. e., either attracted or repelled by the poles of a magnet. He accordingly made the division into paramagnetic and diamagnetic substances, the former being those attracted, and the latter (by far the greater number) those repelled.

The paramagnetic substances, including the majority of mineral species, may be divided into two classes: (1) Those that are highly magnetic; (2) those that are only feebly so. The first class is complete with the substances iron, nickel, cobalt, magnetite and pyrrhotite. Some idea of the gap between these two classes will be given by the following table, taking the magnetic attractability of steel at 100,000:

|                 |        |
|-----------------|--------|
| Magnetite ..... | 65,000 |
| Siderite .....  | 120    |
| Hematite .....  | 93     |
| Limonite .....  | 72     |

Knowledge of the paramagnetic property of those substances of the second class has been one of great scientific interest, and has been made use of to some extent in the mineralogical laboratory, but Mr. Wetherill has been the first to employ it for commercial process. The object he had in view in inventing the machine was the treatment of franklinite ore of Sussex county, New Jersey. This ore is a mixture of franklinite, willemite and calcite, with smaller amounts of zincite, fowlerite, tephroite and garnet. The problem was to obtain the zinc-bearing minerals, willemite and zincite, as free as possible from the franklinite, garnet, tephroite and fowlerite, the iron-manganese bearing minerals, the presence of the latter being fatal to the direct production of metallic zinc. After much experimenting Mr. Wetherill succeeded in accomplishing this result successfully in 1895. The machine as placed in the McGill laboratories differs from his original type, both in the form of their magnets and their position with regard to the necessary belts, whereby the ore is brought into the magnetic field, and the products discharged. The McGill machine is intended for experimental work, and as far as the writer's knowledge goes is of a different design to any that have been used in practice, though the physical principles of the process are, of course, precisely the same.

Figs. 1 and 2 illustrate the arrangement of the magnets and belts.  $P_1$   $P_2$  (Figs. 1 and 2) are the pole pieces of two electro-magnets, and  $B_1$   $B_2$  the cores and spools of these magnets. The following information has been supplied by the makers: Each spool is wound with thirty-five layers of No. 12 Browne & Sharpe gauge D. C. C. copper wire. The two spools average 115 turns of wire per layer. The two magnets are so wound as to give with four amperes of current an exciting force of 32,200 ampere turns. It has been found by experience that a greater number of ampere turns for a pair of magnets with cores and pole pieces of the size employed in this machine does not increase the intensity of the magnetic fields to any noteworthy extent. The cores and pole pieces are of wrought iron, and are of the following dimensions: Cores, 6 inches in diameter 12½ inches long; pole pieces, total length 12 inches, width 6 inches and 5 inches thick. The upper pole pieces are tapered at the bottom to 45° on each side. What would otherwise be the angle of the pole piece of the first pole is rounded to a radius of ½ inch. The pole piece of the second pole is correspondingly rounded to a radius of ¼ inch. The lower pole pieces have their upper long edge rounded to a radius of 1 inch. This pointing of the pole pieces of the upper magnet is perhaps the most important feature of the machine, as by reason of it is produced the highly intense magnetic field, which is the peculiar feature of the machine. The bringing of the pole pieces to a point or rounded edge forces a great number of lines through this contracted area, thereby producing a very highly intensified magnetic field. GGGG are

pieces of brass screwed on to the sides of the pole pieces of the upper magnet to afford a smooth rounded surface for the cross belts  $C_1$   $C_2$  to run on. In operation the ground ore is fed regularly on to the feed belt D, which carries it into the field of the magnets. The magnetic particles are attracted by the intense field of the upper magnet, are picked up from the feed belt, and cling to the cross belts  $C_1$   $C_2$ , which move along the face of the pole pieces at right

angles to the direction of D. The magnetic particles cling to the cross belts as long as they remain where the magnetism is intense enough to hold them, then they drop from the belt into the hopper E. These cross belts are made of one thickness of canvas, coated with rubber and are quite thin. The non-magnetic portion of the ore remains on the belt D, and is carried over and deposited in the hopper K. The lower magnet is fixed, bolted to the frame, while the upper is hung from the rods AA, and can be moved up and down at will. The intensity of the magnetic attraction acting on the ore on the belt can be adjusted by altering the distance of the magnets from the belt, or by changing the amperage of the current passing through the magnets by means of a rheostat. A third adjustment can be made by changing speed of the feed belt, which has of course a most important effect on the capacity of the machine, the layer of ore to be separated being necessarily very thin. By making the proper adjustments a whole series of minerals can sometimes be successively picked out of an ore or rock. Beginning with low amperage and the magnets a good distance from the belts, we can gradually increase our amperage and move the magnets nearer the belt, thereby getting a series of minerals of gradually diminishing magnetic permeability.

I will now give some results that have been obtained with the machine at McGill. A test was made on a sample of franklinite ore. The ore was crushed through a sieve of ten meshes to the inch, and then divided into several sizes by screening, and each size passed separately over the machine. The result was that in each case a magnetic product was obtained containing nearly all the franklinite and other iron-manganese minerals, the zincite and willemite passing into the non-magnetic tails, which were practically free from iron-manganese materials. This is precisely the separation that Mr. Wetherill sought in inventing the machine.

One of the most interesting applications of the concentrator is in the separation of zinc blende and galena, a problem that has long been the bugbear of mill men the world over. In the case of an Ontario lead ore a middle product of mixed zinc blende and galena was formed by jigging. By crushing small enough to divide the blende and galena into separate particles, and passing the ore through the magnetic separator, a practically complete separation of the blende and galena was obtained, the blende being the magnetic product. It is said to have been made use of successfully in treating the tailings of the Broken Hill mine in Australia. These consist of zinc blende, with a certain amount of galena, rhodonite, garnet

and a quartz gangue. The material is crushed to pass through a 20-mesh sieve. The products were: (1) Magnetic heads containing all the rhodonite and garnet, and a small portion of the zinc blende. (2) Almost entirely zinc blende, but carrying 7.7% lead. (3) Quartz gangue, carrying the rest of the galena and a little blende. It is probable that with finer crushing the second product could be made to go considerably lower in lead, the lead being probably present as galena included in grains of blende. The machine has also been made use of for extracting the magnetic constituents from a corundum ore from Hastings county, in separating the various constituents of some rock from the Villeneuve mica mine, and in the concentration of certain black sands from placer workings. The machine seems to be adapted to the following work: (1) The separation of certain zinc minerals from the other injurious constituents of an ore, as at Franklin. (2) The enrichment of red and brown hematite ores. (3) The concentration of a silver-lead ore with a limonite gangue. (4) The concentration of manganese ore. (5) The separation of a mixture of apatite and rutile. (6) The removal of a rutile and garnet from a monazite sand. (7) To obtain pure garnet from garnetiferous rocks and schists. (8) Garnetiferous copper ore from Mexico. (9) Corundum ores from which garnet and other deleterious ferruginous minerals were to be removed. (10) Ores containing siderite, as in cryolite from Greenland.

### Progress of the Simplon Tunnel and Temperature Observations.

Work on the Simplon tunnel up to Sept. 30, 1901, has progressed, in the north or Brieg heading, 18,804 feet; in the south or Isella heading, 14,422 feet—a total of 33,226 feet out of a finished length of tunnel of 64,718 feet. The total advance during the month of September was 1141 feet. The average daily advance was 19.6 feet for the north heading and 18.5 feet for the south heading, both using machine drills. The average number of men employed has been about the same as previously, 3277 being employed on the work during September, as against an average of 3236 during the year ending July 1, 1901. The geological aspects of the work have undergone some changes. Up to 15,200 feet the north heading was in crystalline, calcareous slate; at that point a more micaceous, slaty rock, containing an abundance of granitic particles, was encountered. A little further on the tunnel passed into a white marble, and still a little farther on a fine-grained white gneiss was reached, which soon passed over again into crystalline slate rock. The south end of the tunnel has from the beginning advanced mainly through an extremely hard antigorio gneiss, whose resisting qualities greatly retarded progress. At about the 14,200-foot point this rock gave place to crystalline limestone, which was not expected for some time. After some 200 feet of marble, this rock in turn gradually disappeared and was replaced by calcareous, slaty and schistose formations.

Temperature observations have been regularly made, the temperature of both rock and air being taken. The maximum observed temperatures have been 92.2° F. in the north end and 88.7° F. in the south end. The water flowing in has sometimes had a temperature of about 91° F. The following table gives some observed averages of rock temperatures (corresponding figures for air are not given, as these would vary with the amount of ventilation):

| —North Heading—               |                        | —South Heading—               |                        |
|-------------------------------|------------------------|-------------------------------|------------------------|
| Distance from portal in feet. | Temperature Deg. Fahr. | Distance from portal in feet. | Temperature Deg. Fahr. |
| 1,640                         | 54.3                   | 1,640                         | 56.2                   |
| 3,280                         | 57.5                   | 3,280                         | 61.2                   |
| 6,560                         | 63.6                   | 6,560                         | 69.7                   |
| 9,840                         | 70.3                   | 9,860                         | 74.7                   |
| 12,920                        | 76.3                   | 11,150                        | 86.9                   |
| 15,090                        | 86.3                   | 11,810                        | 87.6                   |
| 16,490                        | 89.1                   |                               |                        |

Water has caused no trouble until recently. The north side has at no time yielded much water; at the end of September the flow from the portal was less than thirty gallons per second. The south heading struck water in some quantity at different points, mainly in the seamy layers on either side of the nearly dry antigorio gneiss. On Sept. 30 the flow from the south portal was only about seventy-five gallons per second; but on the morning of Oct. 1 the drills in the main heading tapped a stream of water that drove the men from the heading and compelled stoppage of work in the main tunnel. Work was then pushed in the side heading, though even here such quantities of water were encountered as to render machine drilling impossible. The total water flowing from the south portal on Oct. 1 was about 135 gallons per second, but in the three weeks following this amount increased to about 200 gallons (1000 miner's inches) with no apparent decrease in pressure at the face. In the main tunnel a shaft has been carried up to the roof at a point 65 feet back of the abandoned face, and a top heading is being driven forward from here so as to give the water larger outlet area and thereby reduce its pressure, if possible.

A very advantageous feature attendant upon the water flow has been the quite noticeable decrease in

\* From a paper read before the Applied Sciences Society of McGill University, Toronto, Canada, by Prof. E. Andrews.

rock temperatures produced by it; the high temperatures, shown by the table above, had rendered the conditions for work much more unfavorable. The water itself when it first broke through, on Oct. 1, had a temperature of 65° F., and this has now decreased to 62° F. The normal amount of ventilation required has during the past summer been about 39,000 cubic feet of free air per minute, delivered into the north end, and 66,000 cubic feet per minute into the south end.

#### Dam of Montgomery, Ala., Power Plant.

In the construction of this dam we find a piece of masonry which certainly seems to fulfill the conditions for which it was intended. The illustration shows section of dam as built.

The first object to be secured in building a dam is to provide sufficient weight to resist the forces of the

water impounded; second, to so construct the dam as to prevent leaks or seepage. The dam was built of a very hard and durable granite, mostly quarried from the bed of the river, and the stones used were of the largest possible dimensions, some requiring two steam derricks to place them in position and weighing from nine to ten tons. The up-stream and down-stream faces of the dam were laid very carefully with cement mortar beds and joints, the up-stream face being laid with Portland cement. In the central portion of the dam very large rough stones were fitted together and all spaces filled with smaller stones, then packed with spalls, so as to form as nearly as possible a solid mass of rock without mortar. After building up this material for 5 or 6 feet, grouting boxes were placed upon the wall and the spaces between the spalls were entirely filled with liquid cement, thereby insuring all horizontal and vertical joints being entirely filled and cementing the entire dam into one solid mass. By using this method of construction, the weight of the structure has been increased about 10% over what it would be if laid up with mortar joints, and the cost of construction has also been decreased by using less cement. All liability is avoided of leaks from imperfectly fitted mortar joints, which certainly would have resulted from the use of rough rubble stone laid up in mortar.

To furnish a perfectly smooth surface for the water to pass over and to obviate the shaping of the face stones to a batter, a layer of Portland cement concrete averaging 2 feet in thickness extends from the upper side or back of the dam at the crest over the crest in a curved surface and down to the foot of the down-stream side or face of the dam.

The concrete forms were held in place by means of iron rods built into the masonry while building the dam. The batter of the down-stream face of the stonework under the concrete was formed by stepping back as the wall was built, and was left as rough as convenient to form a better surface for the adhesion of the concrete.—Engineering News.

#### Copper Imports and Exports.

Imports of copper into the United States for the first ten months of the last three years, as reduced to pounds of refined copper, are:

|                     | 1901.        | 1900.        | 1899.       |
|---------------------|--------------|--------------|-------------|
| Ore and regulus..   | 85,594,850   | 24,374,014   | 12,233,488  |
| Pigs, ingots, etc.. | 62,429,073   | 60,737,200   | 54,215,193  |
| Total copper.....   | 148,023,923  | 85,111,214   | 66,448,681  |
| Value.....          | \$21,538,916 | \$12,585,341 | \$9,188,896 |

The imports of ore and regulus in tons and values for the ten months of the last three years have been as follows:

|             | 1901.        | 1900.       | 1899.       |
|-------------|--------------|-------------|-------------|
| Tons.....   | 77,308       | 36,523      | 19,916      |
| Values..... | \$11,555,305 | \$3,290,942 | \$1,651,521 |

A comparison of imports and exports of copper the past three years in relation to the excess of exports is as follows:

|                    | 1901.       | 1900.       | 1899.       |
|--------------------|-------------|-------------|-------------|
| Exports, lbs.....  | 175,002,250 | 311,093,440 | 209,345,920 |
| Imports, lbs.....  | 148,023,923 | 85,111,214  | 66,448,681  |
| Ex. exports, lbs.. | 26,978,317  | 225,982,226 | 142,897,239 |

The effort to hold up the price of copper in the face of the lessened demand from abroad has caused the United States to be the best market in the world for the metal, with the result that in only ten months, as shown above, the excess of exports shows a decrease of 199,000,000 pounds.

#### Federal Mining Law.

So many questions are being received at present concerning mining requirements, that the following extracts from U. S. Revised Statutes are published for general information:

Section 2325. A patent for any land claimed and located for valuable deposits may be obtained in the following manner: Any person, association or corporation authorized to locate a claim under this chapter, having claimed and located a piece of land for such purposes, who has, or have, complied with the terms of this chapter, may file in the proper land office an application for a patent, under oath, showing such compliance, together with a plat and field notes of the claim or claims in common, made by or under the direction of the United States Surveyor General, showing accurately the boundaries of the claim or claims, which shall be distinctly marked by monuments on the ground, and shall post a copy of such plat, together with a notice of such application for a patent, in a conspicuous place on the land embraced in such plat previous to the filing of the application for a patent, and shall file an affidavit of at least two persons that such notice has been duly posted, and shall file a copy of the notice in such land office, and shall thereupon be entitled to a patent for the land, in the following manner: The register of the land office, upon the filing of such application, plat, field notes, notices and affidavits, shall publish a notice that such application has been made, for the period of sixty days, in a newspaper to be by him designated as published nearest to such claim; and he shall also post such notice in his office for the same period. The claimant at the time of filing his application, or at any time thereafter, within sixty days of publication, shall file with the register a certificate of the United States Surveyor General that \$500 worth of labor has been expended on improvements made upon the claim by himself or grantors; that the plat is correct, with such further description by such reference to natural objects or permanent monuments as shall identify the claim, and furnish an accurate description, to be incorporated in the patent. At the expiration of the sixty days of publication the claimant shall file his affidavit, showing that the plat and notice have been posted in a conspicuous place on the claim during such period of publication. If no adverse claim shall have been filed with the register and receiver of the proper land office at the expiration of the sixty days of publication, it shall be assumed that the applicant is entitled to a patent, upon the payment to the proper officer of \$5 per acre, and that no adverse claim exists; and thereafter no objection from third parties to the issuance of a patent shall be heard, except it be shown that the applicant has failed to comply with the terms of this chapter.

Section 2327. The description of vein or lode claims, upon surveyed lands, shall designate the location of the claim with reference to the lines of the public surveys, but need not conform therewith; but where a patent shall be issued for a claim upon unsurveyed lands, the Surveyor General, in extending the surveys, shall adjust the same to the boundaries of such patented claim, according to the plat of description thereof, but so as in no case to interfere with or change the location of any such patented claim.

By Act of Congress of Jan. 22, 1890, sections 2324 and 2325 were amended by adding thereto the following words: "Provided, that where the claimant for a patent is not a resident of or within the land district wherein the vein, lode, ledge or deposit sought to be patented is located, the application for patent and the affidavits required to be made in this section by the claimant for such patent may be made by his, her or its authorized agent, where said agent is conversant with the facts sought to be established by said affidavits; and, provided, that this section shall apply to all applications now pending for patents to mineral lands."

Section 2324 of the Revised Statutes of the United States has been amended by adding thereto the following words: "Provided, that the period within which the work required to be done annually on all unpatented mineral claims shall commence on the first day of January succeeding the date of location of such claim, and this section shall apply to all claims located since the 10th of May, Anno Domini, eighteen hundred and seventy-two."

By Act of Congress Feb. 11, 1875, Section 2324 was amended so that where a person or company has or may run a tunnel for the purpose of developing a lode or lodes, owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on such lode or lodes, whether located prior to or since the passage of said Act, and such person or company shall not be required to perform work on the surface of said lode or lodes in order to hold the same as required by this Act.

Section 2323. Where a tunnel is run for the development of a vein or lode, or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within 3000 feet from the face of such tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface; and locations on the line of such tunnel or veins or

lodes, not appearing on the surface, made by other parties after the commencement of the tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid; but failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of such tunnel.

Section 2329. Claims usually called "placers," including all forms of deposit, excepting veins of quartz or other rock in place, shall be subject to entry and patent, under like circumstances and conditions, and under similar proceedings, as are provided for vein or lode claims; but where the lands have been previously surveyed by the United States, the entry in its exterior limits shall conform to the legal subdivisions of the public lands.

Section 2330. Legal subdivisions of forty acres may be subdivided into ten-acre tracts; and two or more persons, or associations of persons, having contiguous claims of any size, although such claims may be less than ten acres each, may make joint entry thereof; but no location of a placer claim, made after the 9th day of July, 1870, shall exceed 160 acres for any one person or association of persons, which location shall conform to the United States surveys; and nothing in this section contained shall defeat or impair any bona fide pre-emption or homestead claim upon agricultural lands, or authorize the sale, of the improvements of any bona fide settler to any purchaser.

Section 2331. Where placer claims are upon unsurveyed lands, and conform to legal subdivisions, no further survey or plat shall be required, and all placer mining claims located after the 10th of May, 1872, shall conform as near as practicable with the United States system of public land surveys, and the rectangular subdivisions of such surveys, and no such location shall include more than twenty acres for each individual claimant; but where placer claims cannot be conformed to legal subdivisions, survey and plat shall be made as on unsurveyed lands; and where by the segregation of mineral lands in any legal subdivision a quantity of agricultural land less than forty acres remains, such fractional portions of agricultural land may be entered by any party qualified by law, for homestead or pre-emption purposes.

Section 2333. Where the same person, association or corporation is in possession of a placer claim, and also a vein or lode included within the boundaries thereof, application shall be made for a patent for the placer claim, with the statement that it includes such vein or lode, and in such case a patent shall issue for a placer claim, subject to the provisions of this chapter, including such vein or lode, upon the payment of \$5 per acre for such vein or lode claim, and twenty-five feet of surface on each side thereof. The remainder of the placer claim, or any placer claim not embracing any vein or lode claim, shall be paid for at the rate of \$2.50 per acre, together with all costs of proceedings; and where a vein or lode, such as is described in Section 2330, is known to exist within the boundaries of a placer claim, an application for a patent for such placer claim which does not include an application for the vein or lode claim shall be construed as a conclusive declaration that the claimant of the placer claim has no right of possession of the vein or lode claim; but where the existence of a vein or lode in a placer claim is not known, a patent for the placer claim shall convey all valuable mineral and other deposits within the boundaries thereof.

Section 2332. Where such person or association, they and their grantors, have held and worked their claims for a period equal to the time prescribed by the statute of limitations for mining claims of the State or Territory where the same may be situated, evidence of such possession and working of the claims for such period shall be sufficient to establish a right to a patent thereto under this chapter, in the absence of any adverse claim; but nothing in this chapter shall be deemed to impair any lien which may have attached in any way whatever to any mining claim or property thereto attached prior to the issuance of a patent.

THE production of copper in Australia in 1899 was 8300 tons; in 1900 it was 23,000 tons. The high price of the past few years has increased mining and the construction of smelters. The Mt. Lyell copper field in Tasmania is an old one, but increased facilities for production are being provided. The North Mt. Lyell has two nests of smelters, consisting of eight furnaces, with a capacity to handle 1000 tons of ore per diem, approaching completion. Other smelters are being erected in the same district. Smelters have recently commenced operations at the Chillagoe mines upon ore yielding 8% copper. The Mt. Garnet Co. is said to be sending 1000 tons of 5% to 7% ore to its new smelter per week, which is to be greatly increased early next year. The Blayney smelter is also treating 500 tons of ore per week. West Australia for seven months of the present year has produced 5880 tons of copper, or at the rate of some 10,000 tons per year, compared with a total of 6180 tons in 1900. The Pillan Copper Co. of New Caledonia, of 200 tons daily capacity, and concentrators of 400 tons capacity, has also commenced operations, and the Girimbone mine has commenced sending ore to smelters.

### Modern Quarry Methods.

"Built of stone" has come to imply solidity, enduring merit, permanency. These qualities of resistance to time's decay suggest a material relatively slow, laborious and expensive to work. A stone bridge will outlast generations, but the reduction in cost of such structures has not kept pace with the rapid cheapening of its modern rivals in steel, terra cotta and clay products, owing to the quarrying of stone being still largely a matter of hand labor.

The direct acting channeler has cut the cost of

Wavy, Curly, Tough Sandstone, 32-Inch Ledge, Broken With Plymouth Power Wedge Holes.

channel cutting in the quarry from the former hand basis figure of 20 to 80 cents per square foot down to 1½ cents to 6 cents per square foot in corresponding material. The cost of drilling plug and blasting

square with the new system. The rate of work is very rapid. An Ingersoll-Sergeant drill, of size suitable for the hardness of rock, is handled by the regular runner and helper. The capacity varies, of course, with the rock and the required size and depth of hole. Usually holes 1½ inch square at the top and tapering to a wedge shape, 5 to 6 inches deep, are

where the lines are long and level and everything kept out of the way.

The holes are finished complete in one operation and are not even cleaned out unless stone has been dragged over them. The long, narrow lead gives plenty of driving depth without bottoming. The thin knife edges of the bit groove the hole sharp and deep

Breaks 2½ Feet Wide, 5½ Feet Deep; Broken From the Top With Plymouth Power Wedge Holes; Blocks 12 Feet Long.

sufficient for ledges up to 24 inches thick, 6 to 8 inches depth, breaking 5½-foot sheets in the quarry from which the illustrations are taken. Sheets 4 to 6 inches thick may be broken nicely with a smaller

on each side like a reamed hole, so the split or fracture leads true from one hole to the next without slivering or ragging.

The steps or offsets of the bit cut the hole wider at the top, so the draw on the wedge is on the point, low down in the hole, and as the wedge does not bear at all near the top there is no chipping, spalling or capping on the upper corners. Small common wedges are used and one-third to one-half the sledging usually required makes the break easier, thus aiding in one of the most laborious jobs in a quarry. As the hole is only 1½ inch square at the top, ¼ inch on each side of the split, there is not nearly so much waste of rock, and the surface is that of a natural break, not disfigured with plug or reamed holes, powder stains, etc., which must often be scabbled off in particular classes of work.

The Ingersoll-Sergeant Drill Co. of New York manufacture these quarry tools and further information can be obtained by inquiring of them.

### Practical Pointers.

The friction of water in pipes increases with the square of its velocity.

A gallon of fresh water weighs 8½ pounds, and contains 231 cubic inches.

Each nominal horse power of boilers will require about 1 cubic foot of water per hour.

A cubic foot of water weighs 62½ pounds, and contains 1728 cubic inches, or 7½ gallons.

A "miner's inch" of water is approximately equal to a supply of twelve gallons per minute.

The capacity of pipes increases with the square of their diameter, thus doubling the diameter increases the capacity four times.

In calculating horse power of tubular boilers, 15 square feet of heating surface is equivalent to one nominal horse power.

The mean pressure of the atmosphere is usually estimated at 14.7 pounds per square inch, so that with a perfect vacuum it will sustain a column of mercury 29.9 inches, or a column of water 33.9 feet in height.

To find the capacity of a cylinder in gallons, multiply the area in inches by the stroke in inches, which will give the total number of cubic inches, divide this amount by 231 (which is the cubical contents of a gallon in inches), and the quotient is the capacity in gallons.

To find the pressure in pounds per square inch of a gallon of water, multiply the height of the column in feet by .434. Approximately each foot elevation is called equal to one-half pound pressure per square inch.

To find the diameter of a pump cylinder to move a given quantity of water per minute at a piston travel of 100 feet per minute, divide the number of gallons by four, then extract the square root and the result will be the diameter of the pump cylinder in inches.

To find the horse power required to elevate water to a given height, multiply the total weight of the water in pounds by the height in feet and divide the product by 33,000. An allowance should be made of 25% for water friction; also about 25% for loss in steam pipe and cylinder.

The area of the steam cylinder multiplied by the steam pressure gives the total amount of pressure exerted. The area of the water piston, multiplied by the pressure of water per square inch, gives the resistance. A margin of from 30% to 50% must be added to move the piston at the required speed.

Side and Edge Views of Cutter and Wedge—Plymouth Power Wedge Hole Cutter.

holes has decreased in a like ratio through improvements gained in experience. The cost of drilling, pumping, hoisting and channeling of curb, step, sill and other finished surface dressing is being further reduced by the concentration of all power into a central high duty air compressor plant producing power at the least cost, distributing it over wide areas without perceptible loss and cutting out the many items of expense inseparable from the operation of numerous detached power stations. All these developments have been gradual and progressive, but not, in the present sense, revolutionary. Machinery now accomplishes the channeling and drilling, and compressed air is an important aid to quarrying operations, but stone still costs more to produce than it should.

The accompanying illustrations will show that the last quarry operation requiring skilled craftsmen has been reduced to a machine basis. The improved method shown is destined to widen markets for dimension stone by reducing its cost.

The Plymouth power wedge hole cutter has been improved by two seasons' experience and may be applied to any stone which will break with wedges, in which wedge holes or sheers can be cut by hand. It is believed that this will also prove successful in most limestones and perhaps in granite. Wider applications will be worked out by experience.

The illustrations are of a close-grained sandstone rock, extremely hard and tough. A break with hand-cut wedge hole is almost sure to roll or run off, but 5-foot 6-inch sheets are shown broken true and

Sectional View of Wedge Ready to Drive.

cutter, made of the worn bits—the lead and steps being shortened. The average rate all day long with competent drillers is thirty to forty-five holes per hour, though a lively crew with air or dry steam will often run a hole a minute, or 500 to 750 holes a day,

# Mining and Metallurgical Patents.

Patents Issued December 10, 1901.

Specially Prepared for the MINING AND SCIENTIFIC PRESS

ORE CONCENTRATOR.—No. 688,567; M. P. Willits, Indianapolis, Ind.

An endless belt, multiple jiggging frames thereunder, means for imparting to each side of respective frames a reciprocating motion independent of other side and of other frames, and mechanism for regulating extent of reciprocating motion of respective frames.

AMALGAMATOR.—No. 688,802; S. A. West, San Francisco, Cal.

A pocket in a box adapted to contain mercury, and white or bank sand in box at side of pocket traversed by pulp before reaching pocket, sand being adapted to receive water but to float gold-containing sand of pulp and pocket projecting above sand.

COMBINED ORE ROASTER AND SMELTER.—No. 688,651; P. Kirk, Kirkland, Wash.

An open smelting hearth and vertical roasting chambers rising therefrom at each end and having ore supporting devices, roasting chambers and smelting hearth being in open communication, two injectors for oil and steam arranged on inner sides of each roaster, an air heating chamber with steam blower arranged between injectors, and a pipe and damper for directing hot air blast into top of either roasting chamber.

DOOR FOR ORE ROASTING FURNACES.—No. 688,587; J. P. Bridgewater, Everett, Wash.

A calcining furnace having a slot in its side wall and a series of pins projecting from wall above slot, a series of plates supported on pins and having a vertical bodily movement thereon and normally closing slot, adjacent ends of plates being overlapped and lower forward edge of each plate being beveled upward.

AIR COMPRESSOR.—No. 688,520; E. Hill, South Norwalk, Conn.

A multiple stage air compressor having an interduct that is tapped for drawing air at low pressure, an auxiliary reservoir having a capacity for air equal to quantity of air that is withdrawn from interduct for low pressure use at each pulsation of pistons, and a connection from auxiliary reservoir to high pressure cylinder of pair that tapped interduct connects.

ORE SEPARATOR.—No. 688,279; A. A. Allen, Birmingham, Ala.

A vessel arranged to discharge by overflow a broad unbroken sheet of liquid, a receptacle arranged at a lower level to contain a body of approximately still water and to discharge by overflow at one side, a broad inclined chute extending from vessel to a point in receptacle below plane of discharge of latter and arranged to receive sheet discharged by vessel and deliver it unbroken in receptacle, and means for placing upon moving sheet discharged from vessel a thin layer of material to be separated.

AMALGAMATING MACHINE.—No. 688,439; G. C. Scott, Columbus, Ohio.

A casing, a shaft journaled therein and means for imparting a rotary motion to latter, a closed drum or body mounted on shaft, a plurality of cylindrical plates arranged one with other surrounding and connected with drum or body, a body of mercury contained in casing, latter having inlet and outlet openings.

HYDRAULIC DREDGING APPARATUS.—No. 688,338; E. Risley, Pleasantville, N. J.

A pipe having a flexible or yielding section and provided with counterbalanced lever supporting flexible section of pipe and operated by movement thereof, whereby a predetermined weight or amount is counterbalanced, and a dial-indicator actuated by lever, whereby indications above predetermined weight or amount are registered or made.

ROTARY PUMP OR MOTOR.—No. 688,616; A. Ferguson, One Thousand Springs, Idaho.

A casing comprising removably attached end plates, a shaft and an opposing piston adapted to coact therewith, a piston having a chambered body with hand holes in ends, peripheral piston blade seats and bolt holes extending into chambers, piston blades fitted to seats, and blade attaching bolts occupying bolt holes.

Saving Platinum, Iridosmium and Other Platinum Metals.

Platinum metals will not amalgamate with mercury without special treatment. To save them concentrating appliances must be used and these will also save most of the coated gold, which is usually found in black sand and will not amalgamate without treatment. Ordinary riffles in a gold-saving flume cannot be relied upon to save any considerable proportion of the platinum metals; by far the greatest value creeps over the riffle and is lost. A good concentrating surface is new Brussels or Moquette carpet. A better and more durable surface is a special grade of cocoa matting, sold at 60 cents per square yard in small quantities and 50 cents per square yard by the roll. It is made 27 inches, 36 inches and 54 inches wide; 27 inches is the most convenient width to use.

Make a box 26½ inches wide, 10 to 12 feet long, with 6 inch sides, and give it steep grade, say 24 inches in 12 feet. Screen out the gravel, using a straight flat tom iron with holes about ½ inch to ¾ inch in diameter; if practicable use clean water and just enough to run the sands nicely on the box or table. The flow of both water and sand can be regulated and controlled by strips above the matting at the head of the box to prevent too great a depth of water or sand. To clean the matting, which should be done every few days according to the richness of material, first let a little clean water run over the matting to take away the dirt; then take it up carefully and wash it in a shallow tank, flapping it to and fro to clean it of the concentrate and dirt. A good deal of value will be found on the floor of the box or table, under the matting. Brush these concentrates up with a stiff scrubbing brush, using a little clean water to carry away the dirt, then put the concentrates into the washing tank.

These concentrates in the tank can be cleaned by allowing them to run slowly over a wide sawed board of ordinary roughness. Use only enough clean water to carry out the dirt. The metals will catch on the board and can be brushed up into a vessel having a straight edge like an ordinary dustpan. The grade of this concentrating board should be about 10 or 12 inches in 12 feet. If the board be feathered in sawing, turn the feather downward and not upward against the stream. Care must be used in this operation not to run too much water, otherwise the metals may be carried away before they have a chance to get down and catch on the board surface. A little practice will show how to regulate the water and material. The concentrates obtained will contain the coated gold, platinum and platinum metals. Put them into a pan with a very strong solution of cyanide of potassium and enough mercury to amalgamate the gold. Stir thoroughly for ten or fifteen minutes and the gold will generally amalgamate. Pour off the cyanide solution and use it next time. The platinum metals will remain with the sand in the pan. To clean them of sand use a rough board in the same manner as before, keeping this board for this purpose. Use a very slow trickling stream, allowing it to drip into the bucket or pan of concentrates, just fast enough to run them out and onto the board—the bucket being tipped for this purpose. Watch this operation carefully and do not run away any metals. They will be readily recognized by the description herein given. Platinum metals are all tin white when clean, but the grains or scales are often too fine to catch the eye, and collect with a heavy fine sand and lie in streaks of brown, brown-red or lead color, which creep along the board and are evidently

heavy. Save these concentrates. If you desire to clean them entirely the sand can be dissolved by dilute nitric acid and washed away. Nitric acid does not affect the platinum metals. If the metals are not perfectly clean the factory will take the sand out, if there is not too much, and payment will be made for only the platinum and platinum metals.

The directions herein given are for a small mine. The plant must be enlarged according to circumstances, using the same principles. It is better to increase the number of tables than to enlarge them. If the local conditions should not permit to use as long a table as 12 feet, use a shorter one, but do not be afraid of giving it a good grade. In general do not crowd the tables. Use a steep grade with not too much water. Any of the surfaces named will catch the precious metals, if they can be brought down to it. The plant must be so arranged as to cause the materials and water to run with an even spread, giving the tables grade enough to carry off the sands, which are all more or less rounded, and to allow the heavier metals, usually flattened, to catch on the matting. When once caught they are practically saved, unless the matting is allowed to run dry. In this case, when water is again turned on, many of the fine scales will rise up and go off.

#### The Weber Co.'s Plant.

The Weber Gas & Gasoline Engine Co. of Kansas City, Mo., has been closely identified with the development of the gasoline engine as applied to mining equipments, hoists and pumping outfits, but has not, however, confined its efforts exclusively to these lines. The company has been engaged in engine building since 1869. At that time they occupied what would to-day be considered a comparatively small factory, although at that time it was a large institution, covering 2250 square feet. This shop was devoted to steam engine building and specialties in that line. Since 1884, however, the company has devoted its attention exclusively to the gasoline engine. At that time its factory occupied 5500 square feet, double the capacity of the old steam factory. Numerous additions were made until, in 1895, the ground floor covered 38,000 square feet. The company, however, soon had a repetition of its experience, and before long it found itself as cramped for space as at any time in its history. Accordingly, it was determined to build a new factory, and a site was selected at Eleventh and Twelfth streets and Winchester and Centropolis avenues, Kansas City, comprising an entire city block, and plans were drawn for a single-story factory of stone and steel throughout, making it entirely fireproof. This factory covers 300,000 square feet of floor space. It is divided into five main departments, devoted to gasoline engines and hoists, water works equipments, including pumping outfits, electric lighting engines, marine engines and automobile engines. Each department is equipped with electric cranes, by means of which heavy castings are moved about quickly and handled much more conveniently than could be otherwise. The power for operating these cranes is supplied by an electric plant driven by gasoline engines. In fact, gasoline engines are used throughout the factory, separate plants being installed for the several departments. The company is thus enabled to present a practical demonstration of one of the most important advantages to be derived from the use of this class of motors. Gasoline engines are placed at convenient points and supply the power for operating machinery and tools in the different departments. The records of the company show that this is a very economical arrangement. The company has its own electric lighting plant; this, too, is driven by gas engines, as is also the pumping plant which supplies water for the factory and for fire protection. At the present time the company is turning out daily an average of

ten finished engines of 20 H. P. capacity for various purposes, chiefly for mining equipments, pumping outfits and electric lighting plants.

#### Practical Pointers for Prospectors.

The prospector should observe the character of all loose rocks found in ravines or gulches, especially in eddies, which are of frequent occurrence in mountain districts. In searching the sands washed down by the river it is well to bear in mind that if the bed of the river which flows through a level or open country yields fine gold dust it will yield larger or coarser gold near the mountain, as the finer and lighter particles will float farther away.

Commonly, in a canyon or gulch where gold is found, an accumulation of boulders or gravel may be noticed high up on the sides of the range, and more or less parallel to the bed of the creek. Portions of such deposits should be carefully examined by washing in a pan, as the gold-bearing matter, whether carried there in past ages by running water or glaciers, may contain gold in rich layers, called the rim rock, which is always a riddle for the deposit of gold. Should there be several distinct deposits, the lower stratum on the bedrock would be the richest. It is advisable to remember that when gold is found in placers or hillsides the chances are that gold veins traverse the neighboring elevations of land. Such elevations may prove profitable to work, but this is not necessarily the case. Almost all the rich metal-bearing gold veins are found chiefly in the rocks of an older date than those of the coal measures, although some are found in a more recent formation. The Comstock lode was probably formed by hot alkaline waters as late as the Tertiary period. Without entering into a discussion as to the formation or origin of quartz veins, it may be said that the same law applying to veins in one district also applies to another as to their compass bearing, being parallel, although some distance may separate one lode from another. In some mining districts the second series of veins run at right angles to the first and principal. Such lodes are either of a different nature of mineral to that of the first, or, if the same, are very poor in quality. It is well, also, to remember that a true mineral vein is not likely to exist alone; but many more, either richer or poorer, may be found to form a mineral belt. For this reason the prospector should not set his affections upon one vein alone until he has examined the whole district to his entire satisfaction. In searching for veins, the prospector should study the general geological formation of the country, the cutting landslides, the cliffs, the sides of valleys, the sections of banks exposed to view by the action of water, river beds and dry channels, and if he fails to find rich samples of float rock he should travel up as long as he can find similar rock. When no more is found, he should then start up the hillside or mountain to discover the parent rock from which they came. Frequently at the base of the hill or mountain there is a deposit in the soil, washed down from more elevated ground. High up on the hill may be found the float rock in the form of boulders, or detached portions of the vein, which would not be far from the ore in place. By taking notice, however, of the various undulations and drift, the prospector may come across outcrop on the steep side of the gully or backbone of ridges; and, failing in this, he may travel toward the summits of any range of hills to find the vein.

Fluor spar is favorable for lead or copper, calc spar for lead and silver, but other valuable minerals may be looked for in gulches and ravines, such as stream tin, antimonial silver, metallic copper, platinum grains, telluride of gold, but for a gold-bearing vein there is none better than the one which has an iron cap. The iron oxide is really the result of the decomposition of iron pyrites, and the pyrites would

be found deeper down after finding the vein. The prospector may dig a trench at right angles, if possible, to the lode, in order to examine its character, the nature of the ore and the gangue, and to find the boundary wall, viz., the upper or hanging wall, and the lower or foot wall, as well as to note the direction or strike of the lode. He must sink a prospecting shaft a few feet deeper than the bottom of the trench to determine the exact body of the ore, as the lode may be distorted from its original shape near the surface. But when the direction of the lode is once ascertained, other pits lower down or higher up the hill should be made so as to test the continuity of the vein. Should the vein prove continuous, and the assays turn out well, development may begin.

At the same time no person should be led away by the hope that the deeper the vein the richer the ore. While it is a fact that lead and copper veins do improve by depth, and many gold veins have also, yet many do deteriorate in value as they go down. But it is a recognized fact that veins vary in quality and nature, according to the strata through which they pass, and there are chances that the vein may pinch out, or end in a pocket, or become changed in character and value when least expected, and it is well to err on the safe side and never take ore to an incompetent assayer to be tested. Even experienced assayers are often troubled to get the proper dressing in assaying sulphurets, arsenical or zinc ores. While the capitalist may risk his money in the chances he may take, the prospector's time and labor are worth too much to admit of his expending endless labor in obtaining experience in development work or on uncertain and unreliable assays.

If the lode carries gold or silver or other valuable metal, that fact is not enough to depend upon in estimating its worth. Often the gold is in very fine powder, invisible to the eye, or perhaps coated with a rusty film or silica, which would prevent amalgamation, and, in consequence, though the assay may be favorable, the extraction of the gold from the ore by amalgamation is not satisfactory, as the mercury may sicken or flour. Again, the ore body may be rich enough, but much depends upon the nature of the other constituents. Antimony or arsenic may render it valueless. Before digging commences several samples of the rock should be taken from the lode and examined by a competent and reliable assayer, and the facts ascertained as to the value and quality of the ore, the best method of treating, etc. Unfortunately, this is not convenient in an out-of-the-way place. To assay correctly means a course of training. For this reason no one should undertake the business unless he has practiced under the instructions of a competent assayer. Still, there is no reason why an inexperienced person should not attempt to qualitatively test minerals by some simple methods. To be compelled to go to a chemist, geologist or mineralogist for every little matter of inquiry is inconvenient and troublesome, as there are many unreliable so-called authorities met. Because some miner pronounces such a mineral to be unlike something he has seen in Cornwall, or California, or some other place, the prospector need not be too ready to accept such an opinion, for a miner may be an expert in certain matters, like running a drift, timbering a tunnel, etc., but still may have erroneous notions about such minerals as gray copper ore, silver glance, fine or coarse grain galena, etc. The most experienced mineralogist cannot for a certainty tell at first sight how much gold or silver may be in a particular rock. These metals are found sometimes in the most unlikely formations, and it is common to find a handsome, good looking specimen which will disappoint everybody and carry nothing of value at all. Many of the silicates and carbonates and chlorides are unmetallic to look at, yet have been found very rich. For a long time the chloride of silver deposits in Colorado were passed over without being noticed, as also was the case with the carbonate of lead in Leadville, which, after discovery, in five years converted Leadville into a city of 30,000 inhabitants.

After the prospector has discovered his vein of ore he must consider, before he thinks his fortune made, how far distant are fuel and water for successful operation. He must not grudge a little money in having a dozen or more of his samples assayed and obtaining the advice of a proper assayer. He must remember that a low-grade ore in one place is worth more than a rich one in another, and much more depends upon the character of the ore, whether it must be treated or not. Nearly all the great mines have been found in the manner described. All mountain regions where uplifts and foldings of strata and metamorphism have taken place are favorable to the metal-bearing veins. We have mining experts by the score every year ransacking our camps. Experts pursue their inquiries systematically. When visiting a mine they select samples of the ore from all parts of the mine, every few feet the whole length of the tunnel or shaft. These samples are assayed, then the whole number averaged. In this way they determine the value of all the ore in sight and fix the value of the mine as an investment, and if the price is not satisfactory the matter is dropped.

REPRESENTATIVE WOOD of California has introduced a bill since Congress convened to establish a Department of Mines and Mining.

The Weber Co.'s Plant, Kansas City, Mo.

# MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

## ALASKA.

### JUNEAU.

A trust deed from the Alaska G. M. Co. of Juneau to the North American Trust Co. of New York for \$100,000 has been filed in Juneau. The Alaska G. M. Co.'s property includes eight claims between Sumdum and Windham.

### KETCHIKAN.

The Hilda M. Co. of Seattle, Wash., with C. F. Barlow as president, C. H. Gilbreath vice-president and general manager and B. F. Bringolf secretary, has bought the Hilda copper claims on the north side of Kasaan bay, near Kasaan, on Prince of Wales island.

The Ketchikan G. Co. has been incorporated in Seattle, Wash., by W. S. Grinsfelder and M. D. Lahy of Seattle, J. W. Stedman and J. B. Beagles, Ketchikan, and S. I. Silverman of Spokane, Wash., to develop a gold mine at Sea Level P. O. The 30-stamp mill now being installed on the Sea Level mine at Sea Level will be completed within sixty days.

The Clark Syndicate development work on copper properties on Tolstoi bay is reported to be showing up well.

## ARIZONA.

### COCHISE COUNTY.

The Golden Rule Copper Co. of New York, which is developing the Cuprite mines, near Vall, Mr. Lane Supt., has made a new contract with the owners of the mine, extending the bond for two years. A 14-foot ledge of sulphide ores has been struck.

### GILA COUNTY.

R. M. Foree of Denver, president of the Arizona-Colorado Copper Belt & G. M. Co., has started preliminary work on the company's property near Globe. It is the intention of the company to sink a 200-foot shaft.

### GRAHAM COUNTY.

Stevens Bros. of Los Angeles, Cal., have sold to A. F. Albert and associates of Bridgeport, Conn., fifteen claims near Metcalf.

The output of the Arizona Copper Co. for November is stated to have been 1335 tons Bessemer copper 99% fine, being an increase over the product of former months due to the new smelting plant recently completed. The output in the future, it is claimed, will range from 1300 to 1500 tons per month.

The Copper Belle M. Co., G. M. Ruff manager, is 18 miles from San Carlos. There are two shafts, one 80 feet the other 60 feet, with ore down to bottom of each. A 225-foot tunnel is being run to tap this vein 400 feet down. The company, it is reported, will put up a smelter as soon as the tunnel has reached the vein.

### MOHAVE COUNTY.

The Leonora M. Co. at Hardyville is grading for a 25-stamp mill. The ore yielded, it is said, about \$35 per ton in the 2-stamp mill.

A half interest in the Homestake group in the Gold Road district, near Kingman, has been sold to R. J. Holmes of Phoenix for \$15,000. The ore veins are said to be large and well defined, ranging in width from 8 to 50 feet, and outcroppings for a distance of about 8000 feet. The formation is quartzite and porphyry.

### YAVAPAI COUNTY.

(Special Correspondence).—The Mayer Placer M. Co., managed by W. J. Lester, is operating a dredger on the Big Bug, near the old Commercial smelter. It is of the Marion type, and is said to handle 1500 yards per day. The water supply, amounting to 10 miners' inches constant flow, is pumped from the bed of the stream. Gold values in the gravel are said to be good. The stratum of material is about 20 feet deep.

The Argyle M. Co., a Scotch syndicate, is developing a group of claims on a north and south ledge of ore, in the vicinity of Huron. Thus far the work consists of a 225-foot shaft on the vein, with a 300-foot tunnel on the same vein, this tunnel cutting into the shaft at the latter's 100-foot level. There is also some drifting southward at the 126 and 200 foot levels, showing the vein to run from 1 foot to 5 feet wide, the ore being an iron pyrite carrying gold and silver, with a small per cent of copper. The property is under the management of Geo. H. Gillespie.

Huron, Dec. 11.

(Special Correspondence).—The Blue Bell, 4 miles southeast of Mayer, now has an aggregate of 3500 feet of development work, the most of which is on the center one of the three parallel ledges covered by the company's locations. This includes 820 feet of drifting on the 300-foot

level, showing 25 feet width of copper-iron sulphide ores, carrying gold and silver, the vein being between walls of siliceous slate. The main shaft is being enlarged to 3-compartment and a double-drum geared hoist and a 10-drill Sullivan air compressor, with dynamo for light, are being put in. Manager E. A. Haggott states that the mine is sufficiently opened up to readily produce 200 tons of ore per day.

Parties interested in the Blue Bell mine have organized the Del Rio Smelting Co. of Arizona, and are making plans to erect a 200-ton smelting plant at Del Rio, on the S. F., P. & P. railroad, 4 miles north of Jerome Junction. This location is near the source of the Verde river, where there is an abundance of water, and the site is considered favorable. A tract of 320 acres of land has been acquired there. The plant will comprise copper furnaces and converters, with Nesmith hot blast and auxiliary blowers. The Blue Bell mine is to be the main source of ore supply, though a considerable tonnage of other ores will be purchased.

Mayer, Dec. 10.

(Special Correspondence).—The Val Verde Copper Co., whose smelting plant is at Val Verde, on the Agua Fria river, have recently installed a circular copper furnace, 48 inches diameter, of the Colorado Iron Works make, with Bretherton attachment for heating the blast. Their other furnace, put in when the plant was erected, is of the rectangular type, 42x120 inches diameter, constructed for lead smelting. The plant includes a Connells-ville blower, having sufficient capacity for both furnaces, and crushers and rolls for the sampling department and a briquetting machine for the fines, flue dust, etc. There are two boilers of 50 H. P. each, a 90 H. P. engine, with air compressor for pumping water from the river. The plant is to be started this month with the copper furnace only, the supply of ores comprising copper sulphides, oxides and some carbonates. J. L. Davis is Supt.

In the same locality, the Standard S. & R. Co. are erecting a concentrating plant, which is being equipped with crushers, conveyors, rolls, elevators, screens, Bartlett and Wilkey tables and slimer. The equipment is being furnished by the Colorado Iron Works, S. McKay being in charge of the construction. A spur of the P. & E. R. R. extends to both smelter and mill.

Val Verde, Dec. 11.

(Special Correspondence).—The Copper Coble M. Co., G. W. Middleton manager, is developing a property in the Bradshaw mountains, 16 miles southeast of Mayer. The locations of the group comprise 50 patented claims covering the strike of a mineral belt about 8 miles in length, the work thereon showing a ledge 8 to 30 feet wide, carrying chalcopryite ores, which Mr. Middleton states run about 8% copper, 5 oz. silver and \$2 50 to \$3 gold. The development consists of shaft and tunnel, which at present has reached a depth of 350 feet. A deeper tunnel is being run that will cut 800 feet below the surface. A force of 35 to 40 men is being employed. A compressor plant is to be put in for air drills, as well as other equipment. It is believed the Prescott & Eastern railway, a branch of the Santa Fe, P. & P. road, will extend from Mayer to this section of the Bradshaws next season.

The Saratoga G. M. Co. will now operate the Moody & Place mine, adjoining the Crowned King mine, Ed. Foltz Supt.

The Union G. M. Co. is operating the Luke mine, in the same locality. This is an old property having rich silver ore. W. J. Rainey is president of the company and C. J. Kimball mine Supt.

Crown King, Dec. 12.

(Special Correspondence).—It is announced by Senator Clark's representatives in Jerome that a 200-ton smelting plant will be erected within the next few months on Equator hill, at the Iron King mine. This property, which is about 5 miles southeast of Jerome, is well developed, showing a large tonnage of iron-copper sulphide ores. Adjoining the Iron King, on the same hill, is the Copper Chief, belonging to Connecticut parties, which is also pretty well opened up, but not operating at present. On the latter group the oxidized ores go down to 300 feet depth, below which is a copper sulphide ore of the same character as that found in the Iron King.

E. D. Treadwell and associates own and control extensive holdings between the Iron King and the town of Jerome, whereon there is a good deal of development in progress. One of the Treadwell groups is the Brookshire, which has a 200-foot shaft, a 700-foot tunnel, 400 feet of drifting on the 100-foot and 500 feet on the 200 level. This work shows a vein running east and west, the ores being a copper pyrite running about 15% copper, 15% iron and 1 oz. gold. The country rock here is diorite and slate. Another group

contains the Cliff mine, having an 800-foot tunnel which is being driven ahead to cut the ore body under a quartzite dike that outcrops at the surface.

In the same locality is the Decatur property, with a 280-foot shaft, from which a level is being run southward expecting to cut an ore body at the contact of slate and porphyry. This belongs to the Decatur M. Co., W. S. Owen, Supt.

The Black Hills group is being developed at a higher point on the range through several incline shafts and tunnels.

The Venture Hill Copper Co. have six claims in this locality, on a line between the United Verde and Copper King, and it is claimed their development shows the ore body below the slate.

Jerome, Dec. 14.

## CALIFORNIA.

The receipts of quicksilver at San Francisco for the year 1901 and the two previous years to date compare as follows:

|                    | For Nov. | Jan. 1 to Nov. 30. |
|--------------------|----------|--------------------|
| 1899, flasks ..... | 2,372    | 21,739             |
| 1900 .....         | 1,654    | 18,646             |
| 1901 .....         | 1,374    | 18,172             |

During the month of November the exports by sea were to:

|                       | Flasks. | Value.   |
|-----------------------|---------|----------|
| Mexico .....          | 250     | \$12,025 |
| Central America ..... | 100     | 4,500    |
| Total .....           | 350     | \$16,525 |
| In 1900 .....         | 435     | 19,640   |

The shipments from January 1st to the 1st of December were as follows:

|                        | Flasks. | Value.    |
|------------------------|---------|-----------|
| Mexico .....           | 3,436   | \$157,053 |
| Central America .....  | 1,008   | 45,393    |
| South America .....    | 20      | 916       |
| Korea .....            | 12      | 543       |
| Japan .....            | 24      | 1,116     |
| British Columbia ..... | 32      | 1,477     |
| Siberia .....          | 2       | 97        |
| New York .....         | 70      | 3,500     |
| Total .....            | 4,604   | \$210,095 |
| In 1900 .....          | 6,588   | 309,261   |

While the deliveries are about the same as last year, the exports show a decrease of 1984 flasks.

## AMADOR COUNTY.

The monthly report of the Del Monte M. & M. Co. at Jackson says: During November the new crosscut tunnel heading was advanced 75 feet and the mouth of the tunnel securely timbered. The east drift on the old tunnel level was advanced 30 feet, striking 3 feet of ledge matter, well mineralized and showing good values. It has been decided to work on the east drift, make a raise, and crosscut the foot wall to prospect the country beyond. The directors have authorized the immediate purchase of a compressor and drills for the work on the crosscut tunnel, that a contract be let for cutting 100 cords of wood for milling purposes, and that arrangements be made for increasing the force of men on January 1.

The Buena Vista C. M. Co. at Buena Vista has completed the necessary mine buildings and is preparing for the machinery and hoist. The company has lately discovered that the surface rock carries good values in gold and silver, and ore from the old dumps assays from \$27 to \$38 a ton.

F. A. Orr says that a rich strike has been made north of Plymouth, on the Wyona quartz mine, owned by Dr. Boyson, who uncovered a 20-inch vein that prospects as high as \$40 per ton.

B. W. Pitts and H. F. Burtwreth have made a rich strike in the Mountain Queen mine at Pine Grove, near Jackson. The mine is opened by a two-compartment shaft.

## BUTTE COUNTY.

Present operations at the Spring Valley hydraulic mine at Cherokee are limited to two monitors, which are piping on some low banks. Supt. Hill states that 30 men are employed at present and it is proposed to work on a more extensive scale next spring.

## CAVALERAS COUNTY.

M. A. Kiser has discovered a rich quartz ledge on the summit of French hill at Mokelumne Hill. The formation is porphyry. The gold is extremely fine. This prospect is within a few hundred yards of the old French hill placer diggings, which in early days were noted as among the richest in the State.

J. H. Mitchell, Supt. of the Santa Rita mine, at Mokelumne Hill, says he will start work on the property at once.

Thirty men are at present employed by the Fannie Marie M. & M. Co. at Glencoe. At the 300-foot level a 4-foot ledge has been cut and drifting on it toward the pay shoot is being done.

## DEL NORTE COUNTY.

S. White, of Kirby, Or., is opening up a quartz ledge in the Shelley creek district.

## EL DORADO COUNTY.

The Upton mine, situated about 7 miles northeast of Plymouth, has been bought by the Western Pennsylvania M. Co., which is preparing to resume work on the property. S. C. Wheeler has contracted to remove the 10-stamp mill from Quartz mountain and install it on the Upton claim. It is expected that the rock will go from \$10 to \$15 per ton.

McNaughten & Staples have bonded the Minnehaha mine, near Georgetown, and will start up the mill. Mr. McNaughten has bonded the Fred Shank mine, also near Georgetown, and will commence work there shortly. A tunnel will be run to the ledge, which runs, it is said, \$6 per ton. The mill will be built on the creek.

## INYO COUNTY.

Ledy Bros. are working on the No Sabe mine, near Independence, owned by them and A. Vanfleet, and have a 20 to 24-inch ledge which samples an average of \$20 gold, with silver and lead in addition.

## NEVADA COUNTY.

A good ledge is reported struck in the Bullion mine, at Grass Valley. The pay shoot was struck below the 1100-foot level. The vein varies from 2 to 4 feet in thickness, and it is believed will warrant the erection of 10 new stamps in the spring, thus making a 20-stamp mill for the Bullion. A new electric hoist is contemplated and heavier pumps will replace those now in use. Mr. Mainhart is Supt.

Work has been commenced at the L. ve Oak mine at Spenceville. W. Reynolds and E. B. Potter are running a drift on a contract.

C. L. Miller is opening up the Armstrong quartz mine at Sweetland.

Operations, it is stated, are to be resumed at the Lupine drift mine, near Washington. A company meeting, held in Nevada City, decided to prosecute development work immediately.

The Grass Valley Con. mine has installed electric machinery, keeping the steam machinery in place in the event of a shutdown to the electric power. The shaft has been timbered 150 feet. An air compressor installation is under consideration. Supt. Coffin says the deadwork has practically been completed, and expects to take out pay rock soon.

## MONO COUNTY.

A. B. Lemmon, of Bodie, says that a mill run of 3000 pounds of ore from the Almono mine yielded \$323, and that a mill will probably be erected on the property.

## PLACER COUNTY.

The Rising Sun quartz mine, 1 mile west of Colfax, is being developed. A tunnel is being driven from Bear river to tap the ledge at the 500-foot level of the old shaft.

It is reported that two companies will build dredgers on the North Fork of the American river in this coming spring. The tailings form a continuous mass up to 30 feet in depth and 400 feet in width for over 30 miles.

## RIVERSIDE COUNTY.

The Tresposes M. Co. has been incorporated at Riverside, with capital \$100,000, by T. Doak, G. N. Reynolds, G. Bratt, T. C. Doak and J. M. Drake, who are the directors.

## SAN BERNARDINO COUNTY.

The Bagdad M. & M. Co., operating a Bagdad, of which E. H. Stagg is manager has had milled 1000 tons of ore at the Barstow mill, which it is claimed yielded \$17,000. The 50-stamp mill at Barstow and the cyaniding plant will now be removed to the mines 8 miles south of Ludlow. The company's head office is located at Rochester, N. Y.

## SHASTA COUNTY.

H. M. Le Baron of Valley Ford, Sonoma county, has bought from Mrs. E. Hobbs the Volcano and Saint George mines near Stillwater, and from G. H. Schiller the Copper Giant and Copper King quartz mines adjoining.

F. Hall, formerly manager of the Sweepstake mine at Weaverville, has bonded at \$80,000 for eighteen months the Arps group of copper claims between Bully Hill and Copper City in the Pittsburg mining district. The Arps group is owned by R. M. Saeltzer, A. Jaegel and J. A. Kahny of Redding and W. Arps of Copper City.

W. T. St. Auburn says that he will reopen the Niagara mine at French Gulch next spring. During the winter months men will be kept at work about the mine repairing the mill.

## SIERRA COUNTY.

(Special Correspondence).—Power drills have recently been placed in the old Claybank tunnel here. This tunnel was started nearly a score of years ago to cut the Gibsonsville-La Porte channel. The tunnel is now more than a mile in length. Recently very hard rock was encountered in the face, which led to the installation of air drills. The compressor is placed at

the foot of the air shaft in the tunnel, and driven by water brought down the shaft under a head of 250 feet. It is expected that the channel will be encountered within 800 feet. The property is now under bond to A. N. Spratt and J. H. Thomas of Oakland. F. N. Fletcher of Berkeley is superintendent.  
La Porte, Dec. 18.

#### SISKIYOU COUNTY.

The McKeene mine, near Etna, has been started up after an overhauling of the cyanide plant. A 40-ton vat has been added to it. The management expects to soon have at least 75 men at work.

Several new mines at Oro Fino have started up and it is expected that a hundred men will be employed within another month. There is talk of a dredging plant for this place.

The Hathaway Bros., who own the Hathaway group of mines on Sugar creek, near Callahans, say that if a custom smelter is not erected in that district by spring they will put up one for their own use. A thousand feet or more tunneling and other development work has been done at their mine, and at the present depth copper values seem to predominate.

R. Winters is in Yreka preparing, it is reported, for the early renewal of dredger operations at Yreka. He succeeds Supt. Abbott in charge.

The Pine Grove placer mine, located about 2 miles above Oak Bar, is being operated by Detroit capital, with Newkirk & Whitney as local managers. A hydraulic lift is to be used and it is expected to start up about the 20th.

#### SONOMA COUNTY.

The discovery of a gold-bearing ledge at Bloomfield is reported. Assays are said to run from \$8 to \$18 per ton. The discovery was made where county workmen were blasting rock for road repairs. One rancher, Johnson by name, formerly a miner, has opened the ledge up by a tunnel and is arranging to set up a stamp mill on the property.

On the lands of the Henshaw estate indications of gold have been found, and on the mountain ranch of Cannon Bros., adjacent, a well-defined ledge has been traced. It is 33 inches in width, with a diabase foot wall and a slate hanging wall. A test of the outcroppings indicate gold, silver and cinnabar, the gold predominating, of the approximate value of \$12 per ton. Cannon Bros. will commence work on the ledge within a few days.

#### TRINITY COUNTY.

At the Bob's Farm mine, in Rattlesnake district, the new 2-stamp mill has been started up. The rock is estimated to run about \$28 a ton and the concentrates go \$195 to the ton. Six men are employed at the mine and mill. The property is owned by Montgomery & Byers of Weaverville.

Montgomery & Stevenson have discovered a pay ledge on their claim 8 feet in width between walls. The ore goes about \$40 to the ton.

On the Grizzly group, J. Schwartz, the owner, is running a tunnel to tap the pay shoot at a greater depth.

The gold quartz mine near Minersville, being developed under a bond by the Altona Quicksilver M. Co., shows a vein 4 feet wide, with the ore now being put on the dump rich in free gold. J. Porter is Supt.

At the Sweepstake mine the work of fitting up for the season's run is nearly completed. The reservoir has been built, and nearly all the pipe from it to the mine is in place. All the heavy iron for the completion of the Oregon Mountain siphon has arrived, and if the weather holds good for ten days the siphon will be completed. The ditch to East Weaver will be completed in another week, if the weather is favorable. As soon as the main siphon is completed water can be put on the mine.

#### TUOLUMNE COUNTY.

At the Mazeppa mine, below Stent, the shaft is down between 700 and 800 feet and sinking is being continued.

Mrs. G. W. Hall, of Quartz, has bonded at \$12,000 for one year to J. McFarland the Belcher quartz mining claim, near Stent.

#### YUBA COUNTY.

The old Jefferson mine, at Browns Valley, claimed to have been a large producer in early days, is being reopened. Since 1872 until five years ago the property has been closed down. It is claimed a company has been organized to expend \$50,000 in developing the mine.

#### COLORADO.

##### CLEAR CREEK COUNTY.

The Newhouse tunnel at Idaho Springs, Mr. Hanchett manager, has received its new electric locomotive and is now using it to haul all of the cars. A new dynamo has been installed at the compressor house and the track wired. The trains hauled consist of sixteen cars of three tons capacity each.

Owing to the demand for additional power at the mines working in the tunnel, it is understood that another compressor will be added.

The Mixsell mill at Idaho Springs has been bought by the Bonieta Co., backed by F. H. Clark, and the capacity is to be increased and tables added for concentrating.

A cyanide plant will probably be added to the Gold Standard mill on Chicago creek at Idaho Springs. The mill is being equipped for amalgamating and concentrating, and the cyanide will be used in the treatment of the slimes.

Dr. Shaller of Idaho Springs, who has bought the Mattie mill, is planning to increase its capacity by the addition of more tables.

The Dover Co. of Pittsburg, Pa., which bought the Donaldson mill at Idaho Springs, will, it is said by J. R. Alexander of the company, completely rebuild the plant to handle ores from the Dover and Brighton mines, also owned by that company. The mill has a capacity for treating eighty tons of ore daily.

The Western Mines Dev. Co. of Arizona has commenced the development of the Anglo-Saxon Extension mine, at Georgetown. The company has its head office in Phoenix, with an Eastern office in Minneapolis, Minn. The work is now being prosecuted under the immediate supervision of D. W. Shepard, manager and superintendent for the company.

#### GILPIN COUNTY.

The Ohio claim, at Russell, has been started up by J. F. Milligan, who has a 5 H. P. gasoline engine and erected a temporary building, 14x30 feet. Sinking is being carried on, and some milling ores are being taken out.

#### GUNNISON COUNTY.

At the Augusta mine, near Gunnison, the compressor plant has been installed and work with air drills started. The tunnel is expected to reach the Augusta vein in about 3000 feet from its entrance, at a depth below the old workings of the mine of 1500 feet. The company proposes to remodel the old mill as early as possible in the spring, when they will put in concentrators.

The Patriot M. & M. Co. has been incorporated by W. M. Phillips, J. R. Schermerhorn, Jr., and J. C. Butler, capital \$500,000, to operate mines at Crystal which have had considerable development done. The ore, it is claimed, shows a value in silver, lead and gold of from \$5 to \$160 per ton, and a concentrating mill plant is to be erected. Mr. J. C. Butler, of Denver, is treasurer and general manager, and L. F. Butler, of Denver, is secretary.

#### OURAY COUNTY.

The Yankee Girl and thirteen adjoining claims, near Ouray, have been sold to M. Stephens, as trustee, by G. Crawford and wife, of New York. The construction of a drain tunnel 2 miles in length is projected.

#### SAN JUAN COUNTY.

The Silver Lake people have completed surveys and estimates for an electric power plant from water power. The pressure pipe line is over 29,000 feet long and ends near Needleton, giving a fall of over 500 feet. It is proposed to use a pipe 54 inches in diameter and to develop between 4000 and 5000 H. P. It is understood that Engineer L. R. Hope has advised the construction of the power plant at once.

The Kendrick smelter people have bought the Mehia group of claims, near Silverton, from M. M. Craig. A recent sampling of the vein shows \$20 a ton ore in gold and silver, the proposition being a milling one. Men have been put on by the new owners to do development work during the winter.

#### SAN MIGUEL COUNTY.

The Ophir Con. M. Co. at Ophir, W. S. Buckley manager, has its 20-stamp mill reducing seventy-five tons of ore per day, producing fifteen tons of concentrates. Shipments are thirty-five to forty cars a month, from which smelter returns give values of from \$350 to \$500 per car. In addition four cars of crude ore are shipped monthly which yield \$400 per car. The working force is thirty-four men. The monthly expense account of the property is as follows: Electric power, \$600; mine and mill supplies, \$500; pay roll, \$3000. The credit balance now is claimed to be \$9000 per month, and with the 30-stamp addition to the mill equipment, on which work will soon be started, a much larger profit is expected.

The work of reconstruction is going on at the Bullion tunnel of the Smuggler mine at Telluride, and it is thought probable that by the first of the year a partial resumption of operations can be made.

#### TELLER COUNTY.

L. H. R. Von Ruecau, of Cripple Creek, says that his plans for a transportation and drainage tunnel penetrating the Cripple Creek district at a depth of 3000 feet

have been indorsed by the English company which has had them under consideration, and £1,000,000 of expenditure had been agreed upon. The projected tunnel runs under Battle Mountain, cutting the Coin at 2700 feet, the Stratton Independence at 2800 feet, and the Portland at 3000 feet.

In the Newell tunnel, at Cripple Creek, the company is now cutting a station in the winze 300 feet below the tunnel level. It is the intention to install a hoister in the tunnel that will be operated by compressed air.

#### IDAHO.

##### CUSTER COUNTY.

A rich gold and silver strike has been made in the Anna mine, owned by the Lucky Boy G. M. Co. The ore body discovered is about 4 feet wide and it is claimed runs about \$25 a ton.

##### KOOTENAI COUNTY.

Work is to be started on the Mexico, a silver property near Sandpoint, in the Pend d'Oreille country. J. W. Ferguson is manager. The company is planning to drive a crosscut tunnel to open three lodes on the property.

##### MONTANA.

##### FERGUS COUNTY.

The Abbey Cyanide G. M. & M. Co. has been incorporated at Spokane, Wash., to operate claims at Kendall, by J. R. Cook and J. H. Wilmot of Spokane, Wash., and J. Logan Leavel of Bossburg, who, with F. S. Aceley of Kendall, and E. Johnson of Portland, Or., who are the trustees.

In five clean-ups at the cyanide plant on the Barnes-King mine near North Moccasin since its start up, over \$35,000 has been obtained. The ore in the present workings is said to be becoming richer as the work progresses. E. W. King states that when the present mill is running to its full capacity a weekly clean-up of \$7000 is expected.

##### GRANITE COUNTY.

A rich strike of quartz is reported at the Bell Flower mine, near Philipsburg. The strike is on the 300-foot level, and consists of 5 feet of ore, much of it carrying native silver. The mine is owned by C. D. McLure and others, with F. D. Brown as manager.

##### LEWIS AND CLARKE COUNTY.

A strike of rich ore has been made in the Howard mine, near Helena. An average assay of the ore is claimed to show \$55.65 in gold per ton. C. A. Sheldon, who has a bond on the mine, had suspended work in the main shaft until a new boiler is installed. The strike is in a vein of ore found in the tunnel.

##### MADISON COUNTY.

The Fourth of July group, near Pony, E. McConnell, manager, is being prepared for extensive development, and plans are being made to erect a 60-stamp mill on the property as soon as weather will permit.

##### SWEET GRASS COUNTY.

The mill for the Standard M. Co., at Contact, has been shipped, but Supt. Murdock will store it until spring, on account of the weather making installation costly.

The mine of the Milwaukee & Natural Bridge M. Co., at Contact, is showing ore bodies that have widened out. Manager McNulty will increase the stamps by 10 or 15 as soon as the weather will permit hauling them to the mine.

##### NEVADA.

##### ELKO COUNTY.

The new mill for the mines of the King Solomon M. Co. at Charleston is under construction. W. C. Alexander is manager. About 3000 feet of development work has been done on the mines, showing, it is claimed, ore averaging 20 feet between the walls, and assaying an average of \$10 gold and from twenty to forty ounces silver. The mill will be of fifty tons capacity, arranged to be increased to 200 tons. A sawmill is being erected on the ground.

##### HUMBOLDT COUNTY.

The Sheba G. & S. M. Co. has been incorporated in Salt Lake City, Utah, capital \$500,000; G. W. Barth is president and W. H. Child secretary and treasurer. The company owns the Silver Coin, Consolation, Gold Ring, Silver Peak, Roosevelt, East Sheba and West Sheba claims and other properties in the Star mining district.

##### LINCOLN COUNTY.

The Quartette M. Co. are doing development work on the mines pending the completion of the railroad construction. On the 500 level of one of the claims it is claimed the ledge is 40 feet wide, averaging \$70 free milling ore. The company have added to their mill fifteen stamps, making thirty-five in all, and are erecting additional cyanide tanks.

G. Simmons and E. Scherniker have sold the Toltec Gem M. Co. of New Jer-

sey seventeen turquoise mining claims in Crescent mining district, west of the town of Searchlight. Tiffany & Co., people of New York, are said to be interested in the company, and it is understood that work will commence on the mines and that machinery for putting the stones into marketable shape will be erected at once close to the claims.

#### NYE COUNTY.

(Special Correspondence).—The total amount of returns from Tonopah ore shipments up to December 10th is \$1,000,000, averaging \$187 per ton. Total valuation of 30,000 tons of ore on the dumps, including shipping and milling grades, will average \$125 per ton, \$3,750,000. The total output since company started, ten and one-half months, is \$4,750,000. There will be a 20-stamp mill in operation by May 1st which will work at least seventy tons per day, and ore now out and in sight is sufficient to keep it running every day in the year. There are several other claims besides the Gold Hill group and the Clifford group, which are 6 to 15 miles from town, that already show up large bodies of good grade ore, and certainly sufficient to demand another good sized mill. The water question for the camp will be settled within ninety days. It is expected that Tonopah will have connection with the railroad at Sodaville or Candelaria some time next season. Today more people are going into Tonopah than are leaving there, notwithstanding it is 7° below zero. The new company is now in possession and say they will offer work to all who wish to remain after January 1st, on expiration of leases.  
Tonopah, Dec. 18.

J. L. Joseph of Sonora, Cal., and C. Jackson of San Francisco, Cal., and associates have incorporated the Tonopah Con. M. Co. under Arizona laws, capital \$500,000, to operate the McNamara ledge at Tonopah, on which work will commence at once.

The Tonopah mines have been taken over by the Tonopah M. Co. of Nevada, the final payment of \$186,000 having been made on December 1. The new company are now receiving machinery for hoisting and the contemplated deep shaft will soon be under way.

#### WASHOE COUNTY.

H. T. Benson and W. E. Livesly of Denver, Colo., have bought the Jumper mine at Olinghouse canyon for \$6000, and have begun development work on the mine. The old owners, Abbey, Day and Jackson, are to have 10% royalty on all ore taken out until the purchase price is fully paid.

#### NEW MEXICO.

##### OTERO COUNTY.

The American C. M. & S. Co. has been incorporated, with R. H. Morbes and W. B. Grace of El Paso, Texas, and C. H. Stevens of Santa Rosa as incorporators. The capital is \$400,000, the head office El Paso, and the New Mexico office at Tularosa.

##### SANTA FE COUNTY.

The smelter of the Santa Fe G. & C. Co., at San Pedro, has been closed for the winter, the men being transferred to the mines in which development work and stoping is to be done upon a more considerable scale. The smelter, it is stated, will resume as soon as the Santa Fe Central R. R. from San Pedro to the coal fields is completed, which is anticipated by May 1, 1902.

R. B. Thomas, Supt. of the smelter at Cerrillos, says the smelter will be blown in on January 15, 1902. Shipments of ore from the company's Hardscrabble mines at Magdalena, Socorro county, for the smelter have begun. Machinery has been ordered for a new concentrator, which is to be erected near the smelter.

##### OREGON.

##### GRANT COUNTY.

The Magnolia mine, near Granite, has been bonded to L. Y. Keady, of Portland, at \$100,000, by J. Coyle, of Granite, Jones Bros., of Sumpter, and P. A. Conde, of Baker City. It has a new 10-stamp mill on it. It is stated that a large force will be put to work on the mine at once.

At the South Cougar mine, at Granite, a long tunnel has been run in and a blind ledge struck which carries high-grade ore. This tunnel is being continued forward toward the main ledge.

##### JACKSON COUNTY.

The Braden quartz mines, near Gold Hill, which have been closed down, will resume operations soon, it is reported. Ray Bros. of New York are the owners and managers of the Braden properties.

##### JOSEPHINE COUNTY.

G. W. Johnson of Portland has bonded the Legal Tender mine in the South Myrtle Creek district, near Grant's Pass, and is developing the property.

At the Cass copper mine, near Waldo, recently bonded by R. B. Whiteside of

Duluth, Minn., at \$100,000, an 8-foot ledge carrying copper values of 15% to 60% is reported to have been struck 200 feet in on the upper tunnel. A large force of men is employed at the mine.

A large quartz ledge, carrying values in both free gold and sulphurets, has been discovered in the Dry Diggings district, 5 miles east of Grant's Pass, by H. C. Perkins and A. J. Pike. The ledge is exposed where cut across by Rogue river and in the bedrocks of the Dry Diggings hydraulic mines. Assays intended to be of average rock gave \$2.50 free gold and \$3.10 sulphurets per ton. The ledge is easily accessible for large work, lying in such a position that the rock could be quarried out in quantity.

The Dry Diggings hydraulic mines, near Grant's Pass, have been sold by H. A. Corliss to C. H. and A. H. Ament of Chicago for \$25,000. These placers have been worked for the past thirty-five years. The new owners propose to improve, repair and add to the general equipment of the mine. The widening and deepening of the ditches that bring the water supply has already begun.

The Pearl M. Co. of Elk creek, near Grant's Pass, is preparing to run its quartz mill.

At the South Myrtle gold quartz mines, near Grant's Pass, a new strike of 5 1/2 feet ore of high grade is reported in the Continental claim.

G. W. Johnson of Portland has started work on the Oatman & Robinson claims near Grant's Pass.

#### SOUTH DAKOTA.

##### LAWRENCE COUNTY.

H. Wattson and associates have incorporated the Jupiter G. M. Co., capital \$2,000,000, to develop the Dead Broke group of mines near Deadwood. The property consists of ten claims, which show ore that, it is claimed, will average about \$6 a ton. This ore, it is said, can be mined and milled for \$1.50 a ton. The company has ordered a 200-ton cyanide mill. The ore is a conglomerate made up of gravel, cemented together by peroxide of iron. The body is 30 feet thick where it outcrops.

The Homestake M. Co. has bought the stock of the Father de Smet M. Co. and taken possession of that company's property. The new De Smet mill and hoisting plant will commence at once the work of developing the mine below the 200-foot level.

#### UTAH.

##### JUAB COUNTY.

The Uncle Sam Co. of Tintic is considering the erection of a concentration mill.

##### SALT LAKE COUNTY.

The Rogers concentration mill at Bingham has been bought by E. A. Wall of Salt Lake City. The intention of the buyer, it is understood, is to make additions to the machinery and to remodel the plant.

The Highland Girl M. Co. has been incorporated in Salt Lake City, capital \$10,000, with A. Shaw, president, and C. M. Nielsen, secretary. The company owns the Superior and Imperial claims at Big Cottonwood.

##### SUMMIT COUNTY.

The Comstock M. Co., at Park City, is to equip its mine with a concentration plant. The milling ores at the Comstock are said to be entirely free from zinc and show an average of 16 ounces silver, 14% lead and \$4 gold per ton. To raise the grade to a commercial proposition, the company has planned a mill of at least 100 tons daily capacity, arranged to be increased as the ore bodies justify it. Manager Dusseldorf says reports from the mine are very encouraging.

##### WEBER COUNTY.

The Equity G. M. & M. Co. has been incorporated at Ogden, capital \$125,000, with W. C. McLaughlin, president, and J. B. Milner, secretary. The company owns the Peacock, Admiral Dewey, Flying Dutchman, Retriever Nos. 1, 2 and 3, Antem, Iron, Venus, Jupiter, Star Fraction, Antem Nos. 1 and 2, and Peacock No. 2, in the Weber mining district.

The Lost Lode Co., capital \$20,000, has been incorporated in Ogden with J. W. Conlisk, president, and G. F. Busch, secretary. The company owns the Lost Lode claims Nos. 1, 2, 3 and 4, in Birch Creek district.

#### WASHINGTON.

##### CHELAN COUNTY.

The King Solomon group of mines, near Cle-Elum, has been sold by E. Whitson, F. Parker and K. Dunlap, for \$50,000, to A. W. Frater of Seattle, acting for himself and Cleveland and Buffalo people. The property consists of four claims, from which much ore has been taken out already. The assays run from \$11 to \$60 to the ton in gold and about 5% copper.

##### SPOKANE COUNTY.

The Rustler M. & M. Co., capital \$250,-

000, has been incorporated by D. P. Bowlers, W. D. Wrighter and W. W. Thornton of Spokane.

#### WYOMING.

##### ALBANY COUNTY.

G. C. Clark of Cheyenne and associates have relocated the Abandon mine in the Jelm district, 30 miles southwest of Laramie, and sunk a shaft 20 feet from the abandoned workings. In this, at a depth of 50 feet, ore of great richness has been found. It is reported that machinery will at once be put in to develop the property.

##### CARBON COUNTY.

The ore of the New Rambler mine in Grand Encampment district is claimed to carry platinum. Assays on ore, it is reported, give 1.5 to 6.8 ounces of platinum to the ton. An assay on matte from the Grand Encampment smelter is said to give 67% copper and 4.64 ounces platinum to the ton. The discovery, if confirmed, is unique.

#### FOREIGN.

##### BRITISH COLUMBIA.

The annual meeting of the Black Cock (Ymir) Gold Mines, Ltd., has been held. A. J. McMillan of Rossland was re-elected chairman and W. Tomlinson secretary. The company propose to resume work on the mine at Ymir.

The report of Managing Director R. J. Frecheville on the Le Roi mine, at Rossland, shows that the gross value of the ore in sight is \$5,687,000, and that it can be estimated to give a net profit of \$1,221,000. The tonnage in reserve is estimated at 484,000 tons. On the basis of 20,000 tons a month, the normal rate of shipment, the ore in sight will keep the mine running for two years. Mr. Frecheville says that on the lowest level of the mine there is an ore body 24 feet wide, averaging \$15 a ton. The average value of all the ore in the mine is \$11.75 a ton, and he reports that the total cost of treating it in future should be not more than \$9 a ton.

The Neepawa group, near Slokan, has been bonded for 18 months to English people by A. McGillivray and E. Shannon, New Denver, and associates. The bonders have commenced work on the property. W. H. Sanford of New Denver is in charge.

The Rockland C. Co., recently incorporated at Grand Forks, capital \$2,000,000, has elected J. P. Graves president and G. W. Wooster secretary and treasurer. The mine, which is on Slokan lake, will be developed next spring.

The War Eagle mine at Rossland is being unwatered. The intention is to start regular underground work as soon as the mine is clear. No ore will be shipped, however, until the improvements at the Trail smelter are completed.

J. Marshall, of Lillooet, states that the Anderson lake group, near Lillooet, in which he is a large shareholder, has been bonded to San Francisco, Cal., people at \$60,000 for one month. The present owners have a 10-stamp mill in operation, and have two tunnels opening the mine.

#### MEXICO.

The Sonora M. & M. Co. at Sonora has sent a quantity of ore for experimental treatment to Los Angeles. Con. O'Keefe, president of the company, is with the ore being tested and expects to order machinery on the result of the test. The ore shipped for the test was an average of the developed mines, an assay of which gives \$15 per ton. Forty-five men are employed taking out ore and on development work.

The Mexican Anthracite Coal & Mining Co. has been organized to work anthracite coal fields reported to be in the San Marcial valley, Sonora, 30 miles from Hermosillo and 20 miles from tidewater at Guaymas. The anthracite is 85% carbon. A shaft 300 feet deep has been sunk and a concession from the Mexican Government requires that 150 men shall be steadily employed at the mines before the end of 1901. A railroad 32 miles long will be built between the mines and Hermosillo and Guaymas. It is proposed to ship the coal to San Francisco.

#### KLONDIKE.

Hanaum & Cowan have sold the Graftor group of mines at White Horse to the Moore Investment Co. of Seattle, Wash., for, it is reported, \$30,000. Development work on the Graftor mines has been started and several carloads of ore are to be taken out and shipped to Seattle for a mill test.

A big mining rush has taken place to Mayo creek, in the Stewart River district. The rush is said to have been started by prospectors discovering placers along Mayo creek which appeared to have been worked about two years. It is said that several Swedes had been working on the creek secretly, not recording their discovery, fearing a rush that would get the claims away from them. The stamperders are said to have located the entire creek.

#### Personal.

COL. H. B. MAXSON of Reno, Nev., is in San Francisco, Cal., for medical treatment.

F. ROBINSON has been appointed foreman of the Red Cloud mine at Leadville, Colo.

N. B. WHITE of the Hartford M. Co. of Custer City, Idaho, is in Salt Lake City, Utah.

E. R. STAFFORD is now superintendent Horse Shoe Copper M. Co., Safford, Arizona.

LEO VON ROSENBERG is in San Francisco, Cal., for a few days, en route to Mexico.

K. KLING is Supt. Seattle Co-operative M. Co., at its placer mine near Jacksonville, Or.

A. B. COOK of Auburn, Cal., assumes management of the Crystal M. Co., Crystal, Colo.

CHESTER W. BROWN, manager Inca M. Co., Peru, S. A., is visiting Los Angeles, Cal.

F. M. ISH has returned to Cripple Creek, Colo., after several months absence in Nevada.

FRANK HALL, formerly manager of the Sweepstakes M. Co. at Weaverville, Cal., is in Mexico.

CHARLES B. RICHARDSON of Newsome, Idaho, will sojourn for some months in Oakland, Cal.

C. P. HARRINGTON succeeds T. C. Schwarz as manager Iron-Silver M. Co., Leadville, Colo.

W. H. HENDER has been appointed superintendent of the Arizona C. & S. Co., at Globe, Arizona.

H. C. WOODROW of the Texas, Shasta county, Cal., mine, has returned there from San Francisco.

D. W. SHEPARD has been appointed manager of the Western Mines Dev. Co., at Georgetown, Colo.

J. E. WILSON, M. E., of Los Angeles, Cal., is at Nogales, Arizona, examining mines near that place.

S. G. WESTON, manager of the Baltimore mine, near Elko, Nev., is sojourning in Salt Lake City, Utah.

VICTOR N. CLEMENT has returned to Salt Lake City, Utah, from a month's professional trip to Mexico.

W. H. THOMAS, consulting engineer for the British Columbia Copper Co. of Greenwood, B. C., is in New York.

T. E. SCHWARZ, manager of the Iron-Silver M. Co., at Leadville, Colo., has resigned on account of ill health.

J. D. THOMPSON, manager of the Bonanza mine at Quitova, Sonora, Mexico, is sojourning at Pasadena, Cal.

J. T. LEATHAM of Grass Valley, Cal., has been appointed superintendent of a mining property near Casa Grande, Ariz.

MANAGER CARSON expects to employ 200 men at Pony, Mont., when the Jeanette G. M. Co.'s 100-stamp mill is finished.

P. MIXSELL, who has returned to Idaho Springs, Colo., from California, says that he will return there in the spring to put up a stamp mill.

WM. T. ST. AUBURN, former Supt. of the Niagara mine at French Gulch, Cal., has returned from New York and is now in Redding, Cal.

H. A. KELLER, late of Kennet, Cal., will make his headquarters at 120 Sutter street, San Francisco, Cal., as heretofore, after Jan. 1, 1902.

MR. DAVIS, the inventor of the Davis Calyx drill, will personally superintend the operation of one on the Brunswick lode, Virginia, Nev.

A. M. CANDEL of Denver, Colo., is now busily engaged in compiling the catalogue for the Mine & Smelter Supply Co. referred to on this page.

E. McDONALD, formerly with the Montana Ore Pur. Co. at Butte, Mont., has been appointed manager of the Fourth of July mines at Pony, Mont.

L. C. TRENT, now manager Mt. Lyle C. M. Co., Kelley Basin, Tasmania, writes that the new plant he is now putting in will be one of the largest in the world.

D. B. HUNTLEY, manager the De Lamar Co., De Lamar, Idaho, has resigned to assume charge of mining operations in Rhodesia, South Africa, whence he leaves Jan. 1, 1902.

A. S. BIGELOW, who has been Supt. of a large mine in Siberia for several years, is at his former home, Columbia Hill, Nevada county, Cal. He may return to Siberia again.

F. L. SIZER has relinquished the operation of the Rosario mine, Guadalupe-y-Calvo, Mexico, and will resume the practice of consulting mining engineer, at Butte, Montana.

PRESIDENT E. C. VOORHEES of the California State Mining Association has

returned to Amador county, Cal., from San Francisco. While in the latter city he appointed the members of the several standing committees of the Association for the ensuing year.

A. M. RANDOL, for many years with the North Star Mines Co. at Grass Valley, Cal., has an appointment as head book-keeper at the Cananea Con. mines at La Cananea, Sonora, Mexico.

J. W. WESTFALL, of Trout Lake, B. C., superintendent of the Old Gold Q. & P. M. Co. and of the Primrose G. M. Co., was reported in Rossland, B. C., on the 12th inst., en route to San Francisco, Cal.

E. V. ORFORD, assistant manager of the De Lamar mines at De Lamar, Idaho, has been appointed manager, vice D. B. Huntley, resigned. Thos. Davey, who made so good a record in the tunnel work there, continues as mine Supt.

FIRST LIEUT. ROBT. P. JOHNSON AND LIEUT.-COL. DAVID P. HEAP have been nominated by President Roosevelt as members of the California Debris Commission. He has also nominated Col. Geo. S. Gillespie to be chief of engineers, U. S. A.

#### Commercial Paragraphs.

THE Mine & Smelter Supply Co., with offices at Denver, Colo., Salt Lake City, Utah, El Paso, Texas, and City of Mexico, write that they are now compiling a 700 page catalogue of mining machinery and supplies that is to be issued in the early spring. They say: "This book is to be one of the best and completest catalogues ever published in its line. It will touch on every branch of machinery and tools of importance to mining and machinery men. The book is being laid out along original lines that will make it a ready reference book of great value. Aside from its completeness as to material the book is to be a fine edition typographically. None but the best of illustrations will be used and the paper will be of a very high grade. The circulation will be very large, the book going to all prominent mining and machinery men in the Western States and Territories, as well as in foreign countries."

#### Catalogues Received.

The Sullivan Machinery Co. of Chicago, Ill., have issued Catalogue No. 45 on Sullivan-Corliss engines. It gives in comprehensive form data and specifications for these engines, and like the other catalogues issued by this company will be a useful book of information to machinery users. The Sullivan Machinery Co. will mail it on application. Address 135 Adams street, Chicago, Ill.

BAKER & HAMILTON of San Francisco, Cal., have issued a trade catalogue, the fifteenth annual, descriptive of the Peerless boiler and engine. The large number of sizes and types adapted to special uses which this firm manufacture are exhaustively described and illustrated in this catalogue, which will be mailed on application to them.

#### New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING DEC. 10, 1901.

688,456.—STREET RAILWAY SWITCH—W. J. Bell, Los Angeles, Cal.  
 688,289.—FIRE ESCAPE—H. H. Boyen, Bakersfield, Cal.  
 688,587.—FURNACE DOOR—J. P. Bridgewater, Everett, Wash.  
 688,295.—BOILER FEEDER—C. Cummings, Oakland, Cal.  
 688,622.—CAN HEADING MACHINE—E. E. Forry, S. F.  
 688,727.—CAR TIPPLE—Geske & Miller, Seattle, Wash.  
 688,776.—CARBURETER—C. V. Greenamyer, Los Angeles, Cal.  
 688,636.—MAGAZINE GUN—G. W. Gruver, Priest Valley, Cal.  
 688,415.—MORTISING MACHINE—W. L. Holman, S. F.  
 688,522.—CANE TRANSPORTATION—A. Horner, Pasadilla, H. I.  
 688,536.—CAR COUPLING—W. H. Keen, Acampo, Cal.  
 688,651.—ORE ROASTER—P. Kirk, Kirkland, Wash.  
 688,785.—JOINT LOCK—R. H. Knight, Pasadena, Cal.  
 688,474.—DRIVING GEAR—H. W. Lupton, Los Gatos, Cal.  
 688,660.—GOPHER GUN—O. L. Maxfield, Hollister, Cal.  
 688,747.—HASP LOCK—J. A. McMillen, S. F.  
 688,748.—VEHICLE—R. A. Morton, San Jose, Cal.  
 688,795.—VEHICLE BRAKE—B. W. Scott, San Jose, Cal.  
 688,708.—NUT LOCK—J. M. Sigafus, Perris, Cal.  
 688,559.—MUSIC LEAF TURNER—M. R. Stapp, Aberdeen, Wash.  
 688,802.—AMALGAMATOR—S. A. West, S. F.  
 688,566.—ROTARY ENGINE—S. M. Williams, S. F.  
 688,454.—CABLE TENSION DEVICE—A. L. Wilson, Seattle, Wash.

ASSESSMENT NOTICES.

**YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 17th day of December, 1901, an assessment (No. 5) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 124, 11th floor, Crocker Building, corner of Post and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**EDWARD H. STEARNS, Secretary.**  
Office—Room 124, Crocker Building, San Francisco, California.

**GARIBOLDI MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given that, at a meeting of the Board of Directors, held on the 14th day of December, 1901, an assessment (No. 1) of one and one-half (1½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 18, 550 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 11th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**R. L. OHENEY, Secretary.**  
Office—Room 18, 550 California street, San Francisco, California.

**NATIONAL CONS. MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of November, 1901, an assessment (No. 15) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 773 Mission street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of December, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 23d day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**GEO. W. FLEISSNER, Secretary.**  
Office—773 Mission street, San Francisco, California.

**ORLEANS CONSOLIDATED MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of November, 1901, an assessment (No. 1) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 324 Pine street, Room 10, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of December, 1901, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on THURSDAY, the 30th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**GEO. P. THURSTON, Secretary.**  
Office—324 Pine street, Room 10, San Francisco, California.

**INYO MARBLE COMPANY OF CALIFORNIA.**—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of November, 1901, an assessment (No. 35) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, 10th floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**CHARLES E. ANDERSON, Secretary.**  
Office—Room 31, 10th floor, Mills Building, San Francisco, California.

**MARINA MARISCANO GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of December, 1901, an assessment (No. 26) of four cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**CHAS. BOVONE, Secretary.**  
Office—217 Sacramento street, San Francisco, California.

**DUDLEY MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Bodie, Mono County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of December, 1901, an assessment (No. 13) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 4th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.  
**J. STADTFELD JR., Secretary.**  
Office—Room 56, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

**LARKIN MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 11) levied on the 7th day of November, 1901, the several amounts set opposite the names of the respective shareholders, as follows:

| Name.               | No. Cert. | Shares. | Am't. |
|---------------------|-----------|---------|-------|
| Jno. W. Hinton..... | 423       | 2 00    | 40 00 |
| Jno. W. Hinton..... | 424       | 1 00    | 20 00 |

## Gold Dredging Machinery

And COMPLETE EQUIPMENT for Placer Mines OUR SPECIALTY.

—WE BUILD—

### GOLD DREDGES Complete in Running Order

to handle 2500 cubic yards per day at a cost of 3 cents per cubic yard.

We excavate 50 feet below water, 20 feet above water and handle boulders up to one ton weight.

SEND FOR DREDGING CATALOGUE NO. 17.

—WE ALSO BUILD—

### ALL KINDS OF

Mining, Milling, Concentrating,  
Pumping, Air Compressing,  
Hydraulic, Water Wheel,  
and Hoisting Machinery.

Evans Hydraulic Gravel Elevators.

—We publish sixteen catalogues. Write for one in the line you are interested in.—

All sizes of Steel Water Pipe for City and Town Supply, Placer, Hydraulic and Quartz Mining. Cut, punched and rolled to be riveted at destination or made up complete.

We make a specialty of all kinds of Heavy Sheet Iron and Steel Work. Plans and Estimates furnished.

## "Dusedau's"

A SYSTEM UNEQUALED FOR ECONOMY AND SIMPLICITY.

## "PATENT STEEL" ROPE.

For Conveying of Ore, Fuel, Merchandise, Etc.

Cost of Maintenance 50% less.

Will do 20% more work at a less cost of Operating.

Attaches Mechanically. Detaches Automatically.

ESTIMATES, CIRCULARS AND FULL PARTICULARS ON APPLICATION.

Address "ROPEWAY DEPT.,"

**BRODERICK & BASCOM ROPE CO.,**  
ST. LOUIS, MO., U. S. A.

Western Office: W. DUSED AU, 503 Mining Exchange Bldg., Denver, Colo.  
NEW YORK OFFICE AND WAREHOUSE, NO. 33 SOUTH ST.

## TRAMWAY

"DUSED AU'S" FAMOUS ROCKING SADDLE. ENORMOUS SAVING IN ROPE.

## The New BARTLETT Concentrator.

Solid Iron Tops for Coarse Work. Solid Rubber Tops for Fine Work.

Will take the place of the entire system of jigs and slimers, doing the work much better, at less cost.

Works all ores, from 3-mesh down, without sizing.

Especially designed for separating zinc from lead.

Runs with less water, takes less room, less attention, and has fewer wearing parts than any other concentrator. All parts interchangeable.

Fully patented. Absolute protection guaranteed to customers.

SEND FOR OUR CATALOGUE NO. 7. CONTAINS VALUABLE TABLES AND DATA ON CONCENTRATION.

MANUFACTURER OF

## Mining Machinery

Above cut represents our 40 inch by 15 inch Special High Grade Crushing Rolls of which we built 36 sets for the new 5,000-Ton Concentrating Mill of the Anaconda Copper Mining Co.

These rolls are designed especially for heavy duty, they are very strong in every detail and provided particularly with very strong steel shafts and extra large bearings, the springs and tension rods are designed for the heavy pressure necessary to satisfactorily crush very hard ores.

The contract for these 36 sets of rolls was awarded to us in competition with most patterns in the market, after a thorough investigation by the experts of the Anaconda Copper Mining Co.

Our assortment of patterns for crushing rolls is very large, of all styles and standard sizes, for coarse and fine, wet and dry crushing. We have special patterns for sectional rolls to be carried on mules.

We furnish all shells for our rolls of Midvale "Perfected" Rolled Steel unless otherwise ordered.

DEWEY, STRONG & CO., San Francisco, Cal., and Washington, D. C.

We are prepared to transact business with our clients direct from either our San Francisco or our Washington office. We have representatives in every country in the world having patent laws. The information accumulated through long and careful practice before the Patent Office and the frequent examinations of patents already granted, for the purpose of determining the patentability of inventions submitted to us, enables us to advise inventors, often saving them the expense of applying for a patent upon inventions which are not new. All worthy inventions patented through us are described in the *Mining and Scientific Press*. Guide to inventors sent on application. Address

DEWEY, STRONG & CO., 330 Market St., San Francisco, Cal., or 918 F St., Washington, D. C.

# THE GRIFFIN

## THREE ROLLER

# ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

**Bradley Pulverizer Co.,** Boston, Mass.

## PEERLESS Horizontal Center-Crank Engine.

Our horizontal center-crank is a strong, simple, plain engine.

The lower slides, the journal boxes, the center of the cylinder, the cross-head and the crank shaft bearings are in a direct line, thus relieving the studs which hold the upper slides from all strain, and bring the thrust of the crank bearings directly on the engine bed and not on the studs. The cylinder, ways and cross-head are of the modern locomotive pattern. The piston has self-adjusting packing rings. The cylinder heads are overhanging and polished, and, in connection with the iron jacket, present a surface always bright, and one that can be easily kept clean. The connecting rods and eccentric rod have adjusting brass boxes.

We justly claim for this Engine large wearing surfaces, durability, great rigidity and strength, extreme simplicity and few parts.

All our engines are run and tested under actual working pressure before shipping, and are known to be in perfect working order.

TRIMMINGS include governor, governor pulley and belt, glass oilers, cylinder lubricator, throttle valve and cylinder cocks.

Send for Catalog and Prices.

## EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeanesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeanesville Pumps.

We claim that in Jeanesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

STURTEVANT MILL CO., 113 Clayton St., Boston, Mass.

**Don't Take Chances**

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings. And our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

**CYANIDE WORK**

and claim to have introduced the use of Cyanide to this Western country by the

**MACARTHUR-FORREST PATENT METHODS.**

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

## Corrugated Pneumatic Hose.

Made absolutely seamless in the fabric as well  
as in the cover. So constructed as to form,  
practically, a compact body. No splitting  
of the tube and opening of the plies, much  
lighter and more pliable, and will stand shorter  
bends without kinking than hose made in the  
ordinary way; will withstand a greater air pres-  
sure than any hose double its weight offered on  
the market. We guarantee this hose to outwear any other style or make of hose for  
the conducting of air under pressure, whether for drills, hoists or pneumatic tools,  
and we are satisfied, beyond any doubt, that for this work it is by far the most desir-  
able and economical hose manufactured.

Plain; Wound with Flat or Round Wire; or Covered with Woven Marline  
Jacket. Sizes 3-8, 1-2, 3-4 and 1 Inch.

## About the Mine.

P & B Paint is the most lasting, serviceable preservative paint that can be used about a mine, in the reduction works, smelter and cyanide works, etc.

P & B Paint resists the action of chlorine gas and acids on metal and wooden vats better than asphaltum, pitch, white lead, black varnish or any other material.

Corrosive action is effectually prevented and all wooden and metal surfaces thoroughly protected by P & B Paint. It comes ready to apply—requires no mixing, stirring or heating—is without odor and dries a brilliant black.

Send for booklet—address Dept. A.

## The Projected Zinc Mining Combination.

For several months some of the same business interests that had a part in the organization of the Amalgamated Copper Co. and the American Smelting & Refining Co. have been reported as being at work to effect an organization of the zinc producing industry on similar lines. Profits have been high, just as they have in all other metal producing industries, additional capital has been attracted, new mines have been opened, the zinc ores of the silver-lead mines of the Rocky mountain region have become commercially marketable, and the invention of improvements in ore dressing and zinc metallurgy have been numerous and largely successful in reducing costs.

At present all these natural effects of high profits have produced their natural effects in an increase of production, which, if not exceeding consumption, is about to, and which is certainly tending to reduce sale prices and lower profits. A combination of part of the producers to maintain profits, it would seem, would be simply setting another cause at work to reduce them. The effects of the combination theory applied practically to copper and lead production should certainly be educational to those interested in zinc production. Combinations to control and limit the exploitation of minerals, the deposits of which cannot be fully monopolized, must in the end fail of their purpose. In such combinations each separate interest joining is taken in at a valuation which is intended to be more or less a capitalization of anticipated profits. To get the profits, prices must be kept up, and the best possible incentive to competition provided.

Zinc producers will do well to keep free from an industrial combination. If overproduction reduces prices, the natural effect will be to limit production by making some of the mines unprofitable and thus cause them to close down. The better mines then have the market to which they are legitimately entitled. The loss to them on their product will be much less in competition with each other than if joined with poorer propositions in a combination.

There is the beginning of what will likely become a very large and profitable zinc mining industry in Colorado and Utah. Those interested in its success

Brookshire Mine, Near Jerome, Arizona. (See page 283.)

will find it promoted most effectively by each striving for an individual success. A combination on the lines projected is more likely to divide losses than profits. On the other hand, a combination of the miners by which they reduce to metal the ores they produce would be commercially advantageous to the miners.

THE tremendous increase during the nineteenth century in the use of metals and minerals stored beneath the surface of the earth has been something prodigious, and has raised the work of the miner to the dignity of a profession equal in value and importance to any other department of human effort. Tin and quicksilver production are on the decrease, and platinum is not produced in quantity sufficient to meet the demand. California has almost a monopoly of the domestic quicksilver supply, and the southern portion of that State is as famous for its tin deposits as the northern portion is for platinum.

## A Review of Mining in 1901.

It is quite the fashion, and indeed almost a mental habit, to measure any industrial progress by its statistics, and conclusions are ordinarily based on comparisons of totals and averages. Quite surely these statistical numbers tell part of the history of an industry, but it may well be questioned if they can tell it all. Going behind the returns will frequently disclose the returns as meaning something different.

The year 1901 in mining is one of the years in which the figures we call statistics do not truly measure progress in the industry. They measure some kind of progress, it is true, but in some directions not the kind that one likes to record of a great primal industry of civilization. It is the present end that counts, for this temporary end is the stepping off ground to the future.

Statistics, when fully gathered and tabulated, will undoubtedly show that the production of mines in the United States in 1901 has been greater in quantity and larger in aggregate sale value than any preceding year. Yet in three important metals the effect of this greater production and larger sale value leaves their future production under commercial limitations due to an already established lower sale price level. The average sale value this year of these metals, copper, silver and lead, has certainly been commercially satisfactory, but the sale value in December, the last month of the year, can not be so regarded when the anticipated business of 1902 is being considered.

Broadly, progress in mining in 1901 is divisible for consideration into progress in the technology of the art, and progress in the commercial exploitation of it. In the former there has been a steady and highly satisfactory advance. With the year's successes in solving some of the problems brought to it from the preceding years' experiences, the workers have a right to be self-congratulatory. In the commercial exploitation of the industry the net results cannot be regarded as satisfactory. Speculative conditions have been created which have induced wasteful investments. The sum total of the capital invested in the exploitation of copper and lead-silver mining has been increased out of proportion to the profit income that this mining will pay for some years to come. Based on artificially high prices, the latest of these investments must adjust themselves to prices, which have some relation to the cost of production.

Gold mining in 1901 has been a steady commercial business. Operators, having practically no concern as to sale prices, have been engaged in effecting economies which, increasing the efficiency of labor, lower the cost of production. The average cost of producing gold is certainly lower at the end of 1901 than it was at the beginning. In part this is apt to be overlooked, as reductions in the cost of production simultaneously bring within commercial reach gold-

bearing deposits that before costs were reduced were unutilizable. Mining has been improved and cheapened by a more general use of vertical shafts in lode mines, by the more general use of power drills, and by the much extended use of electric power transmissions. In placer mining the employment of dredgers has become more general, and the costs of operation have also been reduced by the use of electric power. The average production of units of gold-bearing rock to the unit of day's labor of the miner has been increased more than his wages. In milling and reduction the cyanide process has been much more widely applied. In South Dakota and Montana, particularly, this process, as installed in 1901, will result in a large increase in production and profits during 1902 and afterwards. Lesser economies and reductions in cost have been effected by the use of conveying machinery and in improvements in the detail of concentration methods. Both gold mining and milling are becoming more exclusively mechanical, more efficient to the end desired, and cost less on the average than at the beginning of 1901.

There have been no sensational discoveries of new placer gold fields during 1901. Some discoveries have been made that may become sensational in 1902. The same statement is to be made of lode gold mines. There are as yet no new gold fields though some notable discoveries that may become gold fields in 1902. There has been a marked widening of the limits of old gold producing districts everywhere and some notable examples of successful re-exploitation of supposedly worked out mines.

Copper mining started in the year 1901 on what was generally supposed to be a permanent foundation of a high profit in the industry. The first half of the year was passed without any condition developing to disturb this supposition. The enormous profits of 1899 and 1900 continued to be made. The capital of investors who waited for this proof of permanence of conditions before investing commenced to flow into the industry. It was not until the middle of the year that decreased exports from the United States commenced to attract attention. Later this was followed by reports that enormous stocks of copper were being accumulated as a result of the effort to maintain the price. Evidence that could not be controverted showed that copper was being imported into the United States, being worth more here than abroad. Marked efforts to restrict production followed. Finally in December the inevitable was permitted to happen. Copper mining stocks shrunk enormously in sale value on the exchanges. The largest copper mines in the country were shut down to restrict production. The market price of copper secretly cut under for months past, was openly cut from 17 cents a pound to 13 cents, and there is no reason to anticipate that it will not go lower. The net results to the industry are, first, a timidity, instilled by experience into capital, which will shut off investment and development of new mines for some time to come. Second, a reduction in market price of the metal that wipes out the entire earning power of enormous sums invested in copper mining, in Michigan particularly, in the Western mining States to a less degree. This reduction to the older producing companies means less: they have had abnormal profits and can even under the changed conditions earn normal profits. And third, most serious of all, thousands of miners have been deprived of their occupation. On these men the temporary collapse of the industry they have been dependent on means serious loss and hardship. Forced out of copper mining they are forced as competitive laborers into other branches of mining and thus spread an evil that they are not responsible for beginning.

Silver and lead mining are so closely connected that they are to be considered together. Practically the same of affairs exist in this industry as in copper mining. Abnormally high market prices for lead had made the business attractive to capital for two years past. At the beginning of the year the stability of the enlarged industry was firmly believed in. As with copper the first half of 1901 went by with nothing developed to suggest more than a warning to anticipate the future. The last six months have duplicated the story of copper in the same period. December has witnessed as with copper the open recognition of the real conditions. It has witnessed precisely the same commercial and industrial

effects. The separation of the mining portion of the industry from the ore reduction portion and the concentration of the latter has resulted in an enormous curtailment of lead-silver production in the United States, accompanied with lower prices for what is produced. It is notable that the price of lead in the ore has been reduced a third more than the market price of the metal to consumers. The smelting and reduction company is continuing its business by treating foreign ores, which it can buy still cheaper than the American, and can export, with recovery of duty paid on import, thus preventing their production coming into competition with the accumulated stocks of the United States production they now hold. Meanwhile the same serious effect on the working miners exists. It is reported that in Colorado between 6000 and 7000 miners have been thrown out of employment indefinitely in the production of lead-silver ores.

The conditions of the three industries of copper, lead and silver mining are clearly to be attributed to what is called by the men who are responsible, the industrial reorganization of these businesses. The methods employed have been those of speculation rather than legitimate industry. They first created artificial profit and then capitalized them into paper which they have since exchanged for the coin of the public. The business of reorganization has been a commercial success to them. The industry they reorganized has been brought temporarily to the verge of commercial failure.

The feature in the situation in which there is hope is in the improvement made during the year in the technical practice of the mining and reduction of these ores. Costs have been materially reduced. The average unit of ore costs less to mine and reduce at the end of 1901 than at the beginning. With copper, lower prices will bring very much wider uses. In a little while these new uses, added to the old, will absorb the production of all the mines, old and new alike. Profit may not be so large per pound of copper, but more pounds will be consumed. With lead and silver not so much in this direction is to be expected; the lowered prices are not likely to create new consuming markets. The open road here lies with the mine owners building and operating their own reduction plants. If they owned such plants now there would not be 10,000 idle lead-silver miners, while the cause of the injury continued its business uninterrupted and maintained its profits by reducing foreign-mined ores.

In the mining of the minor metals the operations of the year have been satisfactory to all concerned. These industries have been fortunate in being comparatively insignificant. They have not been large enough to stand reorganization yet.

The mining of 1901 has its lessons to 1902 which its statistical figures of totals and averages would fail to disclose. Chief of these is the obvious deduction from the failure of reorganization, call it consolidation or anything else, to permanently benefit the mining industry. Next in importance is the practical demonstration being made that the miners of the metals can increase the profit margin of their industry by becoming manufacturers of metal as well.

THERE is always money for mining investments, but many would-be investors fancy that nothing but a developed mine should have money put into it. The real miner knows that this is often a mistake. The men who have made the most money out of mines in this country have not done so by buying developed mines at full value loaded with commissions. The great fortunes of Haggin, Tevis, Mackay, Walker, Hayward, Hearst, Clark, Stratton, Cruse, Daly and a hundred others were made by developing prospects into mines. That is the way big money is made in mining; that way lies the profit.

DATA of mine costs are always interesting to practical miners, furnishing valuable information. While usually getting out the ore, transportation, treatment and "general expenses" are among the solely detailed items, the information is not complete. Costs of timbering, pumping, drifting and dead work are of rarer publication, and the latter, when given, is generally charged to "development," though a more rational system of mine accounts would suggest charging dead work to capital account, inasmuch as it represents just so much cost of the mine.

## Concentrates.

CELLULOID can be softened and moulded by pressure under heated oil.

A 60 H. P. ENGINE will use about seventy gallons of gasoline per ten hours.

THE simple solution of any substance in water is always accompanied by a cooling of the water.

IT takes 7½ pounds coal, 15 pounds of dry wood or two quarts of fuel oil to evaporate one cubic foot of water.

A MINOR can legally acquire an interest in a mining location as a locator, but under the law can not dispose of such interest.

AN electrical furnace cannot be used for melting metals at a low temperature. Its heat is so intense that the metals would be burned.

A GOOD WELDING COMPOUND is composed of bicarbonate of iron, 4 ounces; crystallized ammonia, 3 ounces; pulverized borax, 1½ pounds.

A COLUMN of water 43 feet in height will exert a pressure of 18½ pounds per square inch. The rule for any height is to multiply the height in feet by 0.434.

WROUGHT iron pipe 4 inches diameter on the inside has about 1 square foot of inside surface to each foot of length, and will weigh about 10½ pounds per foot.

THERE is a constant relation between the circumference of a circle and the side of a square of the same area. The former multiplied by 0.282 always equals the latter.

SAN FRANCISCO BAY consumes about 200,000 tons pig iron annually, nearly all American, half coming from the East by rail and half by Cape Horn. It is worth in San Francisco \$21 per ton.

A FEW drops of coal oil applied to the hands up to the wrists, and on the ears, neck and chin, will do more to avoid the numbing effect of cold in those parts than all the clothes one can put on.

ONE TON of tin scraps and clippings will yield about 55 pounds of tin, which is secured by treating the scrap by an electrical or chemical process. The Vulcan Metal Refining Co., Sewaren, N. J., so treats tin scrap.

So far as "Concentrates" knows, the only copper converters in present operation on the Pacific coast are at Bully Hill, Shasta county, Cal. The Mountain Copper Co.'s, at Keswick, Cal., are in course of construction.

AFTER a long stop, or when ores containing much free iron is being milled, spots resembling grease will form in the plates, in which case a weak solution of cyanide, or, preferably, a little caustic soda, may be used with good effect.

NO originality is claimed for any of these paragraphs. They are for the most part attempts to answer questions weekly received from "all over," and are made as concise as possible in essaying to accurately give the desired information.

MINE tunnels in hard rock have been driven as much as 100 feet a month by hand. From 60 feet to 80 feet are ordinary rates of advance. Using power drill, as high as 300 feet advance has been made, and from 230 feet to 260 feet records of progress are ordinary practice.

SODIUM NITRATE is a grayish white substance, soluble in water, and when ignited burns vividly with a deep yellow flame. It consists, when pure, of 36% soda and 64% nitric acid. It is in demand commercially in the manufacture of gunpowder, dynamite and nitric acid.

THE duration of sunlight at Dawson, Yukon Territory, Dec. 21st, is three hours and thirty-five minutes. At 12 noon that day the sun is five times its own diameter above the horizon there. At midnight, June 21st, it is five times its own diameter below the horizon there—Nor. Lat. 64° 4'.

NO plate or bars of either steel or iron should be worked at a black or blue heat (say about 500°). The material will stand far more strain either red hot or cold, while at an intermediate point great risks will be run, and possibly strains produced which will result in rupture later on.

UNDER U. S. MINING LAW the possession of the surface of a mining claim is the possession of all veins having their apex within its surface boundaries, although in their course downward such veins may pass beyond the vertical side lines of the location and beneath the surface line of an adjoining claim.

WHEN A BATTERY of cells is used as a source of electric energy, the constant element in the circuit is the E. M. F., while the current depends upon a variety of external conditions. The case is reversed on using an influence machine driven at a constant speed, for then the mean current is the constant element, while the E. M. F. is a dependent variable.

A PAY LEAD in a placer mine is a portion of an old stream channel. If the pay disappears sharply it is a good idea to examine the country ahead on both sides of the lead. The chances are that the continuation of the pay lead is in a high bar or bench. This may be entirely unsuspected, but it is advisable to examine the ground thoroughly regardless of opinions.

A SOLID has no latent heat. When liquefied by heat this heat becomes latent. What is sometimes styled the latent heat of a solid is the quantity of heat required to

melt it. This is not given to the solid except at the temperature at which it melts. When a solid is heated to its melting point its temperature stops rising and all the heat which enters it is spent in changing the condition of the solid to the liquid.

IN estimating the quantity of water a large riveted sheet iron or steel pipe will deliver in a given time, allowance must be made for the projecting rivet heads reducing the area of the cross section of the flow. The amount to be deducted from the pipe diameter to compensate is two and a half times the depth of the projecting heads for low velocities and three times the depth for velocities over 5 feet per second.

PLACER GOLD, sufficiently coarse to be known as fine scale gold, is rarely found more than 5 or 6 miles from its source. Fine flour gold and thin flat scales are carried further. If a placer deposit carrying coarse gold is found to extend unbroken for more than 5 or 6 miles it may be safely assumed that the erosion that has made the placers has cut two or more lode sources, or that the country rocks are themselves gold bearing.

THE U. S. CIRCUIT COURT decided in the Colorado case of Nelson vs. the Champagne M. & M. Co. and V. Z. Reid, that no assessment work need be done on mining claims after the owner has received the certificate of the Receiver of the District U. S. Land Office. The Court also ruled that the ownership of the mine dated from the issuance of the Receiver's certificate, and that at that time the Government control of the property passed absolutely to the claimant.

STAMPS suit the Lake Superior copper ores, which are amygdaloids, carrying the copper in small particles chemically pure. And when the rock is crushed they merely separate the pure metallic copper from the gangue which contains it. The Butte, Montana, ores are sulphides, the copper being chemically united with sulphur and other elements, and crushers substituted for stamps give more satisfactory results, the stamps in this latter case making too much slime.

"J. H. T" SHOULD not attach too much importance to the rulings of some California Superior Courts, which are erratic. Recently an Alameda county judge held that a certain tract of land "could not be considered mining land, because the mining thereon had been done at a loss." Were this rule to hold, the area of mineral land would be materially ensmallled. The California Supreme Court can, however, usually be depended upon to correct the vagaries of the lower courts.

THE exterior lines of a mining location are not in themselves property, but are mere boundaries or instruments of description. They do not give a right to all that is embraced within them, but instead so much thereof as is public land and subject to disposition by the United States. Mining improvements may be placed upon adjoining public or private lands and need not be upon the land actually claimed. This is equally true of location lines so long as private proprietors do not complain.

A SHELL BOILER is one composed principally of plates arranged in the form of a cylinder and riveted together, and provided with suitable heads riveted to the plates into which the ends of the tubes or flues, as the case may be, are secured. A flue boiler is one composed of plates arranged in cylindrical form and riveted together, having suitable heads riveted to the plates into which the ends of from one to six flues are secured. The tubular embodies the same construction as the flue boiler, except that a larger number of tubes are substituted for the flues.

A TRIAL COURT in California made a rule that where the assessment work on a mining claim was commenced on the 31st day of December and continued until the \$100 expenditure was completed, work not being required on Sunday, the assessment work so made counted for the year in which it was commenced, and protected the claim from forfeiture. The decision of a trial court is not final. The same question can be litigated in another action and the reverse decision made. It is better to be safe, and have the work done before the year expires at midnight on December 31st.

WHEN boilers are to be left idle for a long time they should be thoroughly cleaned, as soot collects and holds moisture, so that corrosion goes on underneath the apparently harmless covering until the plates are ruined. A coat of good paint suitable for ironwork will assist greatly in preserving the boilers out of use, and as the expense of it is small, it does not pay to neglect it, for good second-hand boilers are frequently wanted by men who do not care to invest in new ones; but when corrosion is allowed to eat into the tubes and plates they will soon be fit for the scrap heap only, and are not especially valuable even there.

AT PEUBLO, COLORADO, the Guggenheims, and later, the A. S. & R. Co., made a practical success of oil fuel in lead blast furnaces. So also has the Selby Smelting & Lead Co., at Selby, Cal. Coke makes an excellent blast furnace fuel when hard, porous, low in ash and free from dust. The percentage of coke used depends on the ore, the flux and the blast pressure. The richer the ore in lead, and the more fusible the gangue and flux, the less fuel needed. A strong blast, causing better combustion, makes less coke necessary. The average quantity of coal is from 10% to 15% of the charge, for matte smelting from 15% to 18%. The higher the altitude the more fuel required. Charcoal well made from hard wood does

well in small furnaces. Three parts of coke and one of charcoal make a good fuel for lead smelting. A mixture of coke and non-caking coal works fairly well where no copper or arsenic is present in the ore. Wood is nearly always unsatisfactory.

THE creeping of a belt is due to stretching. For every foot of belt that goes on the driver less than a foot goes off and goes on to the follower. If the diameters of the pulleys were equal the driver would make a greater number of revolutions in unit time than the follower would. If there is much stretch in the belt there is a loss of speed. This loss amounts to from 1% to 3%, depending on the belt's elasticity. Since the tension on the belt is kept as low as possible to prevent too much friction on the pulley bearings, the belt that has the least amount of elasticity at low tensions is the one which is the most valuable in this respect.

IN the Rlecan process for the recovery of gold from sulphide and telluride ores in Western Australia iron tanks are employed, these being 11 feet deep, 12 feet long and 8 feet wide, and lined with removable copper sheets. There are two such tanks which are capable, jointly, of treating sixty tons of material per day. The operation consists in agitating the prepared products in the tanks with a dilute solution of cyanide, and conducting through the vat a current of electricity, which deposits the coarse and fine gold as an amalgam to be converted into marketable form. The advantages of the process are stated to be that the gold is recovered in one operation, no after process being necessary.

THERE are two kinds of fans in use in ventilating plants—the centrifugal fan, or blower, and the propeller or disk fan. The former consists of a wheel with several vases mounted on a horizontal shaft and in a carved casing of wood, brick or iron, the air entering through an opening in the center and forced to the outlet by the centrifugal action due to the rapid revolution of the fan wheel. The disk fan is mounted in an opening in a wall, or in the end of a pipe, and drives air by means of its screw action. The centrifugal fan is considered more positive in action especially under pressure, though its delivery is sensitive to variation in such pressure. Air is a good deal like a rope: it is easier to pull it than to push it.

A STEEP grade to the undercurrents of a placer mine is preferable to a very flat grade. The latter is pretty certain to cause a "sanding" up of the riffles, so that the fine gold which the riffles should stop never comes in contact with them. The undercurrent with a flat grade also requires a relatively large volume of water to keep the sand moving, which interferes with the settling of the fine gold. A very steep grade will not sand, and so shallow a depth of water is required to keep the material moving that the gold comes in contact with the riffles, and, checked in down-stream motion, has an opportunity to sink into the dead water and quicksand beneath the thin flowing stream.

TO KEEP a boiler free of incrustations, caustic soda or potash lye is used with good effect. Dissolve one-quarter pound of the soda or lye for each horse power of the boiler in a barrel or tub of water and connect it with the suction of the feed water pump. Use the boiler for a day with the soda in. Then blow out from the boiler after the fires are drawn or banked, or when the engine stops, to the level of the lower gauge cock, or bottom of water gauge, and pump up with fresh water to high water mark. Use the boiler next day as usual, and at night, after fires are drawn and walls cooled below the temperature of possible injury to the boiler, blow out all the water and clean out the boiler. This may be repeated, according to the condition of the boiler, once or twice a month.

THE ownership in a mining claim of undivided interests by two people does not make them partners. They are co-owners. Partnership is a matter of agreement. Co-owners, by an agreement, can form a mining partnership. If A, as a co-owner, bonds his half interest in a mining claim without consideration that is entirely his affair. The action of A does not bind B, who owns the other undivided half interest. If B bonds his half interest for a consideration, irrespective of the nature of the consideration, whether money or its equivalent in assessment work, the whole of it belongs to B, and he is not compelled to divide it with A. If the consideration was fifteen days' work, estimated to be half the amount required, it all inures to B's benefit, and A must perform the other half. The other half must be performed, too, otherwise the location becomes forfeit.

SOME TIME AGO the Commissioner of the General Land Office ruled that thereafter when mining claims conflicted there could be no compromise between the claimants. The practice of the courts has been, in cases where claims have been in conflict, to permit the contesting parties to agree upon a division of the territory in conflict, each taking such portion as may be just and equitable under the conditions prevailing. The Commissioner ruled that if a contestant has a right to a portion of the ground he has a right to the whole of it, and has no right to compromise the case pending a decision of the land office. This ruling would prevent two or more contesting claimants from uniting their interests and uniting both their claims. Such a law would act as a hardship in some instances, but upon the whole would work a benefit, as it would put at rest the question of first ownership in full, and save the possibility of much litigation. So far as "Concentrates" knows the matter has never received final determination.

## Some Yavapai, Ariz., Mines.\*

[STAFF CORRESPONDENCE.]

**GROOM CREEK DISTRICT.**—The Monte Cristo, managed by H. Blauvelt, will have its new 5-stamp concentrating mill in operation by the last of December. In the mine considerable development has been done since last spring and they have quite a tonnage of shipping and milling ore on the dump and in sight in the mine. The shaft, equipped with steam hoist, is 200 feet deep, with two levels opened. The vein courses north and south and is an iron-lead streak, ranging from 6 inches to 28 inches wide, the values being silver, gold and lead. A peculiarity of the ore is the presence of considerable wire silver. The rock carrying this is sorted on a canvas and sacked. Foreman W. H. Mackay estimates that one-tenth of the output is shipping ore, which will average \$60 per ton; the mill ore will run about \$40, and four tons of this will be concentrated to one ton.

The Empire Extension, in charge of James O'Connell, is under development. It is equipped with a steam hoist.

The Home Run group, owned by the Niles M. Co. of Niles, Ohio, has been developing since last spring, the main shaft being now 400 feet deep, with three levels opened. The vein crosscuts the syenite and porphyry formation, coursing north and south, and is about 18 inches wide at the surface and 3 to 4 feet at the 300 level. The ore carries galena and pyrite, with gold and silver values. There is considerable oxidized ore near the surface, and Manager D. Monahan states that while generally a concentrating ore, a large percentage of the values can be saved by amalgamation. The erection of a mill on the property next year is being considered. The shipping ore on the dump is said to run \$80 to \$150 per ton, the mill ore not less than \$20. The Home Run shaft supplies water enough for steam making and milling.

South of the Home Run is the Gold Basis group, in charge of M. H. Dodge, one of the owners, and Supt. Van H. Brooks. The group comprises four claims, opened by 1000 feet of work, with a 5-stamp concentrating mill on the ground. The main shaft is 110 feet deep, with a steam hoist, and there are three tunnels aggregating 500 feet. The claims cover two parallel veins. Some of the work discloses a 12-inch pay streak. This company is made up of Cleveland, Ohio, people.

The Empire is a well developed property, owned by a company of which Dr. W. A. Hendryx is president and manager. The shaft, now at 400 feet depth, is to be sunk 100 feet deeper. The north and south vein is opened up on the 85, 200 and 400-foot levels. The ores are oxidized from the surface to about 300 feet depth, the works getting into the sulphides at the 400-foot level. The vein walls are about 17 feet apart on the 400 level, within which is a 6-foot ledge of ore next to the hanging wall. The gangue rock is a rotten porphyry with quartz, the walls being syenite. The principal values are gold, which in the oxidized ore is quite free milling. The mill (an illustration of which appears on the front page) runs about forty tons daily. It is equipped specially for amalgamating. The material passes from the stamps over plates, thence to storage tanks, draining from the latter into circular agitating tanks with plated bottoms, currents of electricity being passed through the pulp to precipitate the gold. F. E. Mansfield is Supt. and E. Laube millman.

Near the summit, between Groom creek and Lynx creek, are two adjoining properties—the Midnight Test and the Dutchman—both bonded to G. Wood and associates of Prescott. The first is owned by Maj. Pickrell, the second by C. W. Sauer and F. Fierthaler. Both have steam hoists and are considerably developed. The Midnight Test shaft is 375 feet deep and that of the Dutchman 210 feet. Mr. Wood is erecting a small stamp mill on the first named.

**BIG BUG DISTRICT.**—The Poland M. Co., of which C. J. Stone is manager, having a group of thirty-two claims extending from Big Bug gulch across the mountains to Lynx creek, is continuing development and erecting a concentrating mill. The base of operations is on the Big Bug side, some 3 miles above the town of Providence. The feature of their underground work is the Poland-Lynx creek crosscut tunnel, which starts in about 50 feet above the mill on the Big Bug side, and cuts the main vein about 650 feet below the apex. When finished it will be double tracked its entire length of 8000 feet. It is claimed this tunnel will cut twelve well-known fissures. Its greatest depth below the surface will be about 1200 feet. The work is proceeding with air drills and the heading is now in 830 feet. The group has now 7500 feet of tunnel work and drifting. The fissures strike north and south and dip west at about 75°. The tunnel referred to cuts the main vein at 800 feet from the entrance and drifting on it has been commenced. They are also sinking a shaft at a point on the south drift to develop the ore body at greater depth. The old Poland tunnel, 230 feet above this main crosscut, is in on the vein 2100 feet. The new mill, which will soon be completed, has twenty stamps, with steel

anvil blocks and concentrating tables. The ores are considered suited to concentration.

The Big Bug branch of the Prescott & Eastern Railroad is being built from Huron station, via Providence, to the Poland group, and will doubtless be operating within the next thirty to sixty days.

Up the gulch, above the Poland, a number of claims are being developed by J. Gray and others, whose work shows an iron-lead ore in syenite country rock. At Providence it is reported that Supt. E. A. Powers of the Red Rock is soon expected back from the East to start up the mine.

The Annie mine and mill are now in control of J. Gillespie, who states that he will sink the shaft from 385 feet, its present depth, to 700 feet.

The tunnel on the Oriental group, now in 2000 feet, is being advanced and will soon be completed. A 400-foot drift was recently run on the vein to connect with an upraise of 300 feet from the tunnel level.

T. W. Boggs has a 200-foot shaft on his Butternut group, with a considerable amount of drifting in ore, which averages about 4½ feet wide. The vein matter comprise oxidized and sulphide copper ores. Shipments made this year are said to have run 12% to 14% copper. Mr. Boggs states that he has shipped forty cars of ore since the property was opened.

**MCCABE AND CHAPARRAL DISTRICTS.**—The McCabe mine now belongs to the Model Gold M. Co., F. Jager president and E. Caster of Chicago secretary. P. A. Johns, general manager, states that at present an overhauling and remodeling of the mill and cleaning up of the mine is being done preparatory to further development of the property. The shaft is 700 feet deep, with several levels opened. The ores are iron and copper sulphide, carrying gold, silver and copper values. The erection of a new mill is understood to be under consideration.

The McCabe Extension, adjoining the McCabe proper, has recently been started, having now a shaft house, steam hoist and good office and boarding house. A shaft has been sunk 200 feet, from which crosscuts have been run to the ledge at the 100 and 200-foot stations. The intention is to sink to 300 feet and open the ore body also at that depth. R. Ling of Prescott is manager, J. H. Farrell being foreman in charge.

The Gladstone mine, adjoining the McCabe on the same lode, is owned by the Idaho M. & D. Co., of which Col. D. N. Hood is president and C. W. French manager. Good buildings, a steam hoist good for 800 feet depth, dynamo for electric drills and other equipment have been provided within the last six months, and a two-compartment incline shaft sunk 260 feet. An electric drill is operating on the 100-foot level in drifting and another at the bottom of the shaft for sinking. From the old shaft to the east of the new some 2000 feet of work has been done. The ores are iron and copper sulphides, the chief values being gold and silver. Some shipments have been made. It is said the erection of a reduction plant is being contemplated.

The Rebel and Kicker group, still farther west on the McCabe lode, belong to the Pride of Arizona Copper Co., J. P. Darling manager. The Rebel shaft is 750 feet deep, with a good deal of drifting on the 400, 500 and 600-foot levels; and a station is being cut at the 700. This work shows the vein to be 3 to 4 feet wide, carrying a vein of ore which runs 10% to 13% lead, 4% to 10% copper, \$10 to \$20 gold and seven ounces to eight ounces silver to the ton. The Kicker shaft, 300 feet deep, with 500 feet of drifting, shows much the same conditions.

The Silver Belt mine, east of McCabe, near the Agua Fria river, is also under Mr. Darling's management. This property was located in 1870, patented in 1885, and was at that time a considerable shipper of galena ore. The old workings went to the depth of 250 feet. Under present management new machinery has been put in and the shaft sunk to 350 feet depth, where a station has been cut, showing ores there to be an iron, zinc and lead sulphide, but low grade and capable of concentration. A concentrating mill is being erected at Val Verde, on the Agua Fria, to concentrate the ores from the Silver Belt, Rebel and Kicker. The mill equipment includes crushers, rolls, screens and tables; and an effort will be made to make a separation of the zinc from the iron.

The Iron Queen, 2 miles south of the Silver Belt, is being developed by E. D. Treadwell. A shaft sinks 165 feet on the vein, which has a north and south trend. The old Boggs mine, worked years ago, is on the same ledge, but farther north. The work here shows copper sulphides and sand carbonates in a ledge 14 feet wide. N. Waldenmeyer is in charge.

The Dividend 5-stamp mill operates steadily, working nine tons of ore run daily. The ores have an iron and lead base, with gold and lead values. It is claimed 50% of the gold is saved on the plates. Values in the finer slimes are saved on the Bartlett tables. The Dividend mine is opened and worked through two shafts—the Ticonderoga, 200 feet deep, with 400 feet of drifting; and the Dividend, 300 feet deep, with 800 feet of development. A force of fifteen to twenty men are employed.

**JEROME DISTRICT.**—Near Jerome the Brookshire copper mine is being extensively developed by E. D. Treadwell and others. On the front page is an illustration of the mine buildings and shaft equipment.

The development work has disclosed in a 700-foot tunnel and in drifts from a 200-foot shaft an east and west vein carrying, it is claimed, 15% of copper and \$10 a ton in gold. The same people are developing several other ledges in the same district, notably the Cliff mine, on which there is an 800-foot tunnel.

McCabe, Ariz., Dec. 7.

WASCOTT.

### The Wynn Process.

**TO THE EDITOR:**—The general opinion of the late Professor Wynn's process seems to be that he was claiming to make gold. This is a mistake. Professor Wynn never claimed he could make gold. His process he claimed to be a chemical discovery that does not interfere in any way with doctrine of the chemical elements. He quoted himself: "I am not making gold, but saving it."

According to his theory, there are great quantities of very fine flour gold in a number of leads. This gold is so fine that it can be detected only with the aid of strong microscopes. When ores of this kind are assayed, the minute particles melt and fume off before the coarser gold melts, and are thus lost for the assayer. Now, Mr. Wynn claimed he had discovered a way by which he was able to save all that fine, microscopic gold. That this seems reasonable cannot be denied. Gold, like any other substance, must evaporate when heated enough. If it did not, why do the smelters deduct their percentage of losses? If it went in the slag, why don't they recover it? The percentage in the slag is, I am afraid, too small. The principal part of it is fumed off with the heat, settling where it happened after it got cooled.

The only way to save it is to gather it, and the only way to gather it is to use substances that will not absorb it. Looking at this, there is a great possibility of success for the Wynn process.

Telluride, Colo., Dec. 19.

H. H. McLEAN.

[The writer has made the very common error of assuming the conclusion that it is intended to demonstrate as the premise of known fact from which the demonstration starts. The fact that is disputed is the presence of the gold under conditions that would not be appreciable to chemical and physical tests. Gold does not volatilize simply because finely divided. Having high conductivity of heat, the entire mass of rock and metal to which heat is applied must arrive at the volatilization temperature at the same time, and coarse and fine gold particles alike must pass the intermediate stage of fluidity together before reaching that of volatilization. None of the commercial metallurgical processes are so refined that they determine absolutely the quantity of gold in a mass of ore, nor can they get it all out. As a rule, very little is lost in slags and less is lost by volatilization. The probability is that none of the latter goes as vapor of gold, but is carried away in the vapor of chemical combinations formed at high temperature in the furnace. These, cooling, disassociate, but leave the gold so fine that it is mechanically carried with the furnace gases for a sensible period of time while it is gravitating downward through them. Volatilization, however, does not occur in wet methods of chemical analysis, and here fineness of the gold does facilitate its certain and rapid detection. Allotropic forms of the elements show different physical qualities rather than chemical. They never conceal the elemental identity to the methods of analytic chemistry. Finally, the spectroscopic method of analysis would reveal qualitatively the minutest traces of gold in any other substance simply through the use made of the phenomenon of volatilization. It could not be missed by this spectroscopic method, even though it was inappreciable to the highest powers of the microscope. The simple fact is that there was no gold where the late Professor claimed there was. The belief that there might be can not stand for a moment, when the error of accepting the truth of the conclusion as the premise for the reasoning to it is eliminated.—ED.]

THE report of George F. Roberts, Director of the Mint, upon the operations of the mint during the year ended June 30, 1901, states the total coinage of the mints as 176,999,132 pieces, of the value of \$136,340,781. Of this \$99,065,715 was in gold, \$24,298,850 was in silver dollars, \$10,966,648 was in fractional silver and \$2,009,568 was in minor coins. There were also coined at the Philadelphia mint 225,000 gold pieces of the value of \$349,014 for the government of Costa Rica.

THE article on page 274 of the issue of the 21st inst., "Saving Platinum, Iridosmium, and Other Platinum Metals," was written by Mr. W. P. Butler, San Francisco, resident manager The Waratah Minerals Co., Ltd., of Philadelphia, Pa., buyers of those metals.

## New Method of Quicksilver Extraction.

Written for the MINING AND SCIENTIFIC PRESS by  
J. H. JORY.

The pre-eminence of California as a quicksilver producer, and as a territory having the largest deposits of that metal, is well known, but there are some facts in connection with recent conditions of quicksilver mining and their relation to existing methods of extraction on which comment may be of interest.

In looking over the reports of the production of our mines the first thing that strikes the attention is the greater cost of production in recent years, as compared with former periods, through the lesser percentage of metal obtained from the ores operated on. At the New Almaden mine, where the work has been on the largest scale and carried on by the most scientific methods, in the years from 1850 to 1854 the percentage of metal obtained from the ore averaged rather more than 30%. In the five years from 1890 to 1895 the ratio had fallen to less than 1½%.

During the first five years mentioned 15,550 tons of ore were worked, with an output of 120,016 flasks of quicksilver. In the latter five years 81,025 tons of ore were worked, with an output of only 48,409 flasks. As will be seen, though the amount of ore operated on in the latter five years was five times greater than during the first five, the quicksilver product had become two and a half times less.

Nowhere else in the world, perhaps, have there been found as large deposits of cinnabar of such pure quality as those worked in the first ten years of operation of the New Almaden mine, and it is not surprising that as the underground workings increased it was found necessary to operate on lower grades of ore. But the condition of things that exists now at New Almaden, where the average output of metal has fallen below 1% in weight of the ore treated, is the same that generally prevails in all the quicksilver mines of the State, although there are always a few bunches of ore to be found that carry higher percentages.

Another consideration which forces itself on the attention is the large number of quicksilver mines existing in the western part of the State, so few of which are producers of the metal, although it would seem that the mining of the ore would be less expensive in the new mines than in the older ones, where the works extend to a considerable depth below the surface. But this points to the fact that the first cost of the furnaces, condensers and other appurtenances of a large modern distillation plant for quicksilver extraction is greater than can be afforded by mining companies of small capital, and that the cost of extraction by this method on a large scale is so great as to leave no margin of profit to those operating on low-grade ores.

The methods of modern mining, where machinery takes the place of manual labor and thus cheapens the bringing of the ore to the surface, lessens the cost of mining where these are introduced, and in a lesser degree the same may be said of the improved furnaces and other apparatus used in distillation. But to effect such a reduction in cost of extraction of quicksilver as to make this enterprise generally profitable a radical change in the system is necessary.

That such a system is possible will be now shown. Mercury sulphide, also known as cinnabar, as generally found in our mines, and also two or three varieties more rarely found, is soluble in several cheap forms of chemical solutions, and it is on this fact that the new method rests. In this it follows the cyanide method of gold extraction, in that it involves crushing and leaching. The cost of the solvent for quicksilver, however, is very much less than the cost of the cyanide used in gold extraction. The efficiency of the method is also greater, as it is not interfered with by the antagonistic reactions common to the more complex ores in which gold is found.

The operation is briefly as follows: The crushed ore being placed in leaching tanks, and submitted to the action of the chemical solution, after a certain period it is found that all its mercury content has entered into solution. The solution is then drawn off and passed through what is known as the "electrolytic sluice," where the quicksilver is immediately deposited in a pure metallic form and flows into a tank prepared for the purpose, and the solution, exhausted of its metallic contents, is again used as a further solvent.

The cost of the plant for this method is very much less than for the distillation method of extraction. For the working of 100 tons of ore per day there are required six tanks of that capacity, a dynamo of sufficient power for the deposition of the quicksilver contained in the ore operated on, a pump for the solution, and an electrolytic sluice. This, after the crushing machinery common to both systems of extraction, constitutes almost all of the plant necessary. And the cost may be proportioned to a lesser amount of ore to be operated on by providing a plant of lesser capacity and of consequent less expense.

So, a mine having only an output of ten tons of ore per day may start with a cheap plant of small capacity of extraction and work at a profit until a larger output may warrant the erection of a larger plant.

At the works of the New Almaden mine, having all the modern improved methods, and apparatus of distillation, and operating on large quantities of ore, the cost of extraction after crushing amounts to about 75 cents per ton of ore. The loss of quicksilver during the operation amounts to from 7% to 10%. In the new method the cost of extraction would be less than 50 cents per ton of ore when work is done on a large scale and with power handling of the ore, and the cost need not rise as high as that of the New Almaden works, even when operated on as small a scale as ten tons of rock per day.

The most essential part of the new method of extraction, and that which makes possible a cheap and efficient means of working, is the electrolytic sluice. This is an apparatus having a large number of vertical electrodes so arranged that the solution passes between and is almost instantly deprived of its metallic contents. As the quicksilver immediately flows from the cathode plates on which it is deposited and passes into a tank, where it is protected from the solvent with which it may be in contact, the sluice may be kept constantly in use with but the slightest supervision. It is only required, after the solution has passed through the sluice, to run the quicksilver into flasks from a lower level to complete the entire operation.

The electrolytic sluice may be made with a capacity of 600 pounds of quicksilver per day with an expenditure of electric force amounting to about 6 H. P. There is no necessity, under the conditions employed, either of solution or of deposition, of any loss of metal; and this alone recommends the method as a means of extraction, for there is no doubt that, though the losses at New Almaden may sometimes run as high as 10%, the losses in works of less perfect construction run as high as even 25% or 50%. In such places, as is generally known, a slight exposure to the smoke from the furnaces, even in the open air, causes salivation, showing the large amounts of mercury carried away as fumes. It may be stated that it is the electrolytic method of gold extraction so extensively used in South Africa and Australia, and known as the Siemens-Halske process. The electrolytic sluice is constructed for the work to be accomplished, and in all its processes follows closely the well-known laws of electrolysis in producing a deposition strictly in proportion to the power expended; and, therefore, its powers of deposition may be exactly adjusted to the amount of metal in the flow operated on, or, when this is too large, the solution may be diluted to correspond to the highest extractive power of the density of current employed.

The advantages of the described new method of quicksilver extraction, in comparison with the distillation method, may be given as follows:

It involves a lesser cost of construction.

A saving of the large amounts of metal lost in distillation.

A lesser cost necessary in the operation of extraction plant.

The possibility of working lower grades of ore at a profit.

The possibility of applying water power or electric power to all the operations of the process.

And in the elimination of all danger to the health of the workmen and those residing in the neighborhood by the entire absence of mercuric fumes.

## Copper Mineral Formation in Smelters.

Prof. A. N. Winchell, of Butte, Mont., notes, on the formation of certain copper minerals in smelters, as follows: "Chalcopyrite has been reported more than once as an accidental product in metallurgical operations. Bornite, or peacock copper, on the other hand, has never been described as an accidental furnace product, nor as produced by sublimation. Both of these minerals are formed artificially at the smelter of the Butte & Boston Con. M. Co., at Butte. The minerals form slowly, attaining their maximum thickness of about 4 inches in the course of six months or a year, and render necessary the frequent replacement of the old rails by new ones. They form in the caliner along the rails in the bed of the furnace. In fact, they not only form from beneath the flanges of the rails, but also slowly replace the rails themselves. When the rails are removed only a thin upper surface layer of iron remains; all the rest has been changed into chalcopyrite and bornite, with the exception of that portion of the rails completely embedded in the brick bed of the furnace. There is no sharp line or demarcation between the remaining iron of the rail and the new minerals formed. Examination of these minerals shows that the one that is by far the more abundant is unquestionably chalcopyrite; the other is in all probability bornite. An analysis of the former mineral shows an excess of iron; otherwise the mineral has the composition of chalcopyrite. Both minerals have been formed by sublimation and not by fusion, since the temperature of the furnace never rises high enough to fuse the ores present."

## Form for a Report on a Quartz Mine.

Many inquiries are made of this journal for a form of report for quartz mining propositions. The inquiries do not refer to a form for an expert's opinion, but rather one which would enable the owner of such a proposition to prepare, without an expert's assistance, a statement of the essential facts relating to his property, in a concise, comprehensive form, as a basis for preliminary consideration by a capitalist and his expert advisers.

The following, it is believed, will be of assistance to the owners of such propositions. It could be printed in blank form, with spaces left for the statements and answers to questions. This is not essential, however. The claim owner can follow the sequence of the following and write out the information directly—that is, the answers to the questions can be written out in the order and grouping suggested without writing out the questions also.

The statement as written would begin with the introductory heading, "Report on Quartz Mining Locations:"

Named.....; Patented or unpatented?.....; In the..... Mining District, County of....., State or Territory of.....; Located by.....; Recorded in the office of the....., in town of....., on....., 18.., and recorded in book....., on page.....; Up to what date has assessment work been done?.....; How much more work is necessary before patent or grant can be had?.....

Size of properties is.....

Development work done on surface to show up vein consists of.....; Underground development consists of.....; Are all tunnels, shafts and underground workings in good order?.....; Wet or dry?.....; Are all the tunnels, shafts and underground workings in a condition suitable for inspection now?.....; If not, specify what is wrong.....; Give remedy.....; What time will it take to remedy?.....; What will it cost to put into suitable condition for thorough inspection?.....; Will owners place underground workings in condition suitable for inspection?.....; Between what dates can properties be properly inspected?.....

Machinery, improvements, buildings, etc., are.....; Description of main vein is.....; Dip of vein is..... degrees to the.....; Width on surface.....; Length proven on surface.....; Width of vein in lowest workings.....; Intermediate width at..... feet depth.....; Width of pay streak, if any.....; Walls—Foot wall free or frozen.....; Hanging wall free or frozen.....; Country rock, foot wall.....; Country rock, hanging wall.....; Do walls carry any value?.....; Ore soft or hard?.....; Composition of ore?.....; Value of ore per ton—Gold, \$.....; Silver, \$.....; Copper, per cent.....; Lead, per cent.....; Zinc, per cent.....; Is ore free milling?.....; What per cent is free milling?.....; Probable treatment required.....; Can concentrates be cyanided or otherwise treated at the mine?.....; By what process.....; Have there been any assays made from samples fairly taken across the vein from wall to wall?.....; If so, what values are shown?.....; If a concentrating proposition, what proportion does it concentrate to?.....; What is the value of a ton of such concentrates?.....; Average assay of pay streak, \$.....; Average assay of workable ore, \$.....; Individual assays show \$.....; What per cent of the ore value can be realized in bullion form?..... per cent; Have there been any mill tests?.....; Amount of ore milled,..... tons; What value per ton of ore do mill tests show? \$..... per ton; What amount of ore has been stoped out?..... tons; Value of ore in sight in present workings, \$.....; Amount of ore in sight in present workings?..... tons; Describe other veins carrying values.....; Topography of claims.....; Are the veins in the district, as a rule, uniformly mineralized, or do values lie mostly in shoots?.....; Are the veins described in this report uniformly mineralized, or does the pay ore exist in shoots?.....; Altitude.....; Tunnel or shaft proposition.....; Can tunnel be run in on vein matter?.....; If not, how many feet of crosscut necessary to get vein?.....; What depth will be gained per foot of tunnel?.....; Is there a mill site?.....; How far from mouth of mine?.....; Is water available for power?.....; How far is it from mill site?.....; What volume of water is available?.....; What head of water is available?.....; What horse power will it develop? Can additional water power be had within ten miles?.....; How many horse power?.....; Is timber suitable for mining purposes plentiful?.....; Cost of fuel at mine?.....; Is there a wagon road to mine?.....; If not, what would it cost to build one?.....; Nearest railroad station.....; Location of nearest smelter.....; Location of nearest custom mill, if any.....; Second hand machinery unused and for sale.....; Its condition.....; Time for inspection and sampling of properties.....; How much time can be had for working operations and for negotiating sale of properties?.....; Price, \$.....; Terms of payment.....; Property ever reported on?.....; By whom?.....; Where can we get copy of report; Are any adjoining properties for sale?.....; Give names.....; Names and addresses of owners.....; Draw map of properties and adjoining locations, if any.....; Give sketch of underground workings.....

It is a good idea to take a full line or more as needed for the answer to each separate inquiry. It facilitates reference and comprehensive consideration. If several claims are included, the name of each should be stated, and if the character of ore differ it is desirable to write a separate report for each. The maps and sketches are quite important. They should be made clear and complete, so as to assist the reader. It is business that pays to do this well. No information that is in any way pertinent should be reserved.

## Small Things in Mining.

Written for the MINING AND SCIENTIFIC PRESS by  
W. H. STORMS, E. M.

The economies of mining are made up of small things, which, comparatively insignificant in themselves, make up the great science and business of mining, whether the operation be great or small. Every careful manager is desirous of getting as great a return for the money expended as possible, either for supplies or labor. In labor particularly it is necessary to economize. In order to accomplish this, small details of labor must receive attention, and wherever possible mechanical devices should be introduced, which will not only lighten the labor of the men but will facilitate the work in hand, and consequently hasten and cheapen it by reducing the time required to perform any particular duty. In the shafts at the Baliol mine at Jackson, Cal., we have recently introduced devices which were calculated to expedite matters in shaft sinking, and it has been found that these devices act admirably.

Sinking is accomplished here with two machine drills, each on a separate bar placed near the ends of the shaft, which is in two compartments, the cutting being about 7x11 feet. The sinking crew consists of nine men, three on each of three shifts. This crew drills all the holes, blasts, mucks out, and also does the timbering, under direction of the foreman. Often the "cutting holes" are 7 or 8 feet deep, and few of the holes are less than 5 feet deep. In drilling such deep "down holes" it becomes necessary to frequently remove the sludge formed in drilling. To expeditiously remove the sludge is a problem. To accomplish this, usually a scraper or a "muck" stick is employed, until the hole is drilled deep enough, when the machine is shifted to a new position and another hole drilled, continuing until all the holes of the round have been completed, when the machines are taken down and all the holes are blown out by means of a pipe attached to the compressed air hose. This latter is the most satisfactory way of cleaning deep holes, leaving them, as the miners say, "as clean as a whistle," but it is found that the time required to remove the muck from the holes while drilling is so great, when the muck stick or iron scraper is employed, that we introduce a sort of "sand pump" which works expeditiously and with perfect satisfaction. This device consists of a piece 1-inch steam pipe in three lengths, 6, 8 and 10 feet, for the varying depth of hole. In one end is inserted a piece of  $\frac{3}{4}$ -inch pipe, 6 inches long. To secure this short piece of pipe in place, the end of the inch pipe is heated and the  $\frac{3}{4}$ -inch pipe driven in until its lower end has passed about 2 inches beyond the end of the inch pipe, when the outer pipe is shrunken on. This having been accomplished a marble, such as school boys use in play, is dropped into the upper end of the larger pipe, whence it falls and rests upon the ring formed by the smaller pipe that has been driven into the larger. Of course a marble must be chosen which will not pass through the smaller pipe. A steel pin is then driven through the larger pipe, holes having been previously bored for the purpose, about 2 inches above the top of the small pipe. The marble must have free play, being only a little over three-fourths of an inch in diameter, and is confined between the steel pin and the top of the  $\frac{3}{4}$ -inch pipe. When

FIG. 1.

as large as can be operated satisfactorily in the ordinary machine drill hole.

Another simple device employed in sinking in the Baliol shaft is the false track at the bottom of the shaft. I have seen a great many different kinds of false track, but this, I think, is superior to any other I have seen. It is an idea of J. D. Brown, fore-

man at the Baliol. This device consists of a pair of 20-foot "T" rails for each track. Our regular track consists of 30-pound steel rails, but we have found it expedient to lay temporarily 16-pound rails while sinking, these being spiked down in the usual manner for about 100 feet, the change to the heavy rails being made at some time when it will not seriously interfere with the work in the shaft—at the time of cutting a station or at any other convenient time. The 16-pound rails are about 20 feet in length usually, and are put in place to within a set or two of the bottom, a 10-foot section employed when necessary. To enable the skips to reach the bottom of the sink, however, the "sinking rails" or false track are put in place. These, as above explained, are 20 feet in length and are placed in a reversed position, that is, the ball of the rail is placed downward, the base overlapping the main rail and upon the outer side of it. The base of the rail being wider than the ball, keeps the gauge about right. The upper end of the base is forged down flat, and spread somewhat, so that it will not form too great an obstruction on the track, the skip passing smoothly or with little jar over the end of the rail. The web at this upper end is also "upset" somewhat, the ball and the base being drawn closer together in order to make the rail fit more snugly. The false rail may be placed in position when the bottom of the sink is but 2 feet below the end of the main rails on the last set of timbers (though ordinarily the timbers do not approach so closely to the bottom), and the work may be extended downward until it is 10 or 12 feet below the last set. If it is desired to go further, a rod with clamps at the end must be provided to prevent spreading of the rails. The "false rails" are securely clamped to the main rails by means of a device, the construction of which is shown in the accompanying sketch, Fig. 2. The clamps are made

FIG. 2.

secure by driving in a key or wedge, as shown. At first we tried a bolt provided with nuts, etc., but this required too much time for adjustment and was abandoned for the key, which answers the purpose admirably. We always have an extra set on hand in case of a part or all of a clamp being misplaced or lost. The rails are always removed before blasting and drawn upward several feet and securely clamped, so that when required they may be quickly replaced. The rails are lowered as sinking progresses.

When a round of holes has been completed the machines and all the paraphernalia employed in drilling are sent to the surface, when the machinist carefully examines each machine, making such repairs as may be required. It has been found that this plan is more expeditious than that of removing machines, tools, blocks and bars to a level above.

The timbers are protected by fenders of a tough pine 8x10 inches, which are bolted firmly to the main members of the set. The latter are of 10x10 Oregon pine. Two holes are bored near each end of the fenders, these corresponding to the holes bored in the main foot and hanging-wall plates for the passage of hanging bolts. As but one of these holes at either end in the bottom set is in use at a time for hanging the plates, the other is used for securing the fenders. For this purpose bolts are employed having a length equal to the thickness of the plate and the fender, with room for washer below and washer and nut above, making a total length of 20 $\frac{1}{2}$  inches, beside the solid head of the bolt. These bolts are inserted from below. Similar fenders are secured to the end plates in like manner, special holes being bored for the purpose in both end plates and end fender. The wall-plate fenders also have cup-shaped holes cut on their upper faces to accommodate the lower ends of the hanging bolts, with their washers and nuts, which are exposed below the lowest timbers of the main set. If this provision be not made the fender cannot be snugly fitted to the plates. In the Baliol shaft the hanging-wall plate only is protected in the manner described, it having been found that the foot-wall plate suffered little or no damage from blasting. The fender is provided with four transverse bolts and large washers distributed at equal distances, which are for the purpose of lessening the likelihood of splitting the fender by blasting. The set of fenders now in use have protected six sets of timbers and appear to be good for possibly as many more, before being too badly battered to be of further service. The

timber sets are also reinforced by tightly spragging between the last and next to last hanging-wall plates, opposite the center of each compartment. Similar sprags are placed at the ends of the shaft. All this may seem to some an unnecessary expense of time and material, but where ground is fairly hard and slab-like, necessitating carrying the timber sets close to the bottom of the shaft, it pays well to take these precautions, as we have learned by practical experience. As we fire the center cuts first and the ends later, we have had little or no trouble with broken timbers since taking these precautions. It is extremely doubtful, however, if this plan would be of much service where a full round is fired by electric battery.

Another small matter, but one worth mentioning, is the fact that after no end of trouble with machine-drill chuck bolts, we have found that bolts made from cold-rolled shafting endure longer than those made from any other material we have thus far tried. Sutter Creek, Amador Co., Cal., Dec. 15.

## Asbestos.

By JOSEPH HYDE PRATT.

Two distinct minerals are mined and put on the market as asbestos. They are very similar in their physical properties, but are distinct chemically. One is a silicate of calcium and magnesium and is a variety of the mineral amphibole. There are a number of the nonaluminous varieties of amphibole which pass into fibrous varieties, especially the tremolite and actinolite, and all these fibrous varieties are included under the name of asbestos. The other mineral that is called asbestos is a variety of serpentine, a hydrous magnesium silicate known as chrysotile. It was the former of these minerals that was originally used commercially, but as the chrysotile began to be used for the same purpose it was placed on the market under the same name. While these minerals are equal in their heat-resisting properties, the chrysotile is superior in strength and elasticity of fiber to any variety of amphibole asbestos. The former mineral is usually greenish-white, green, yellowish to brownish in color, and has a decidedly silky luster. The fibers are flexible, easily separating from each other and have a silky appearance. It is usually found in seams of varying width in serpentine rocks. The amphibole asbestos has been found in longer fibers than the former, and these are flexible and easily separated by the fingers. They do not have the silky luster of the chrysotile, but have more the appearance of flax. The color varies from white to greenish and woody-brown. One of the main chemical differences between the two is that the amphibole asbestos is an anhydrous mineral, while the serpentine or chrysotile variety is hydrous, containing from 12% to 14% of water. They can be readily distinguished by making a test for water.

The amphibole variety of asbestos is quite widely distributed, but there are not many localities known at present where it occurs in quantity, and then again, on account of the superior qualities of the chrysotile asbestos, there is not as large a demand for the other variety and thus there is but little stimulus given to prospecting for it.

The only two States in which mining has been carried on for asbestos during the past two years are California and Georgia. The latter has produced practically all of the asbestos mined in the United States during the past year. The asbestos deposits of Georgia are located at Sall Mountain, White county.

It is quite common to find the chrysotile asbestos or fibrous variety for serpentine in small amounts associated with the serpentine rocks in various localities throughout the United States. Until recently, however, there were no deposits found where the chrysotile occurred in commercial quantity. At Caspar, Wyo., deposits of this variety of commercial asbestos have lately been found and are being developed.—American Manufacturer.

## Platinum in Norway.

TO THE EDITOR:—I have found here in Norway a ledge of peridotite with serpentine, containing platinum, palladium, tridium and some gold. The ledge is from 4 to 11 feet wide, with quartzite on one side and gabbro on the other side, as well as outside the quartzite. The ledge is running northeast and southwest, almost vertical. We have had a number of assays made, all showing the above mentioned metals from very little, six to twelve grains, up to seven and eight ounces per ton. We also have found several pounds of terrestrial iron in scales. We send you by same mail a small piece of the lode and a few scales of the iron. H. CH. TYSEE.

Arendal, Norway, Nov. 30, 1901.

It has been stated that the total costs per pound of producing copper in 1900 from mines in the Lake Superior region were as follows:

|                      | Cents Per Pound. |
|----------------------|------------------|
| Calumet & Hecla..... | 10.54            |

## Some Principles Controlling the Deposition of Ores.\*

NUMBER II.—CONCLUDED.

By C. R. VAN HISE

Passing from the specific points concerning the circulation of underground water, I, of course, largely dissent from Prof. Kemp's general view upon this subject, and can only refer to the argument already given in my paper. If the evidence there presented, showing that the main source of the underground water depositing the ores is meteoric, and not derived from the igneous rocks, as held by Prof. Kemp, does not prove the point, it is useless further to discuss the matter here. In my treatise on Metamorphism I shall cover this part of the subject much more exhaustively. While I hold that the main source of the water depositing ores is meteoric, I recognize that another source of such water is the igneous rocks.

While I have never advocated a universal uniform underground circulation, as implied by Prof. Kemp, I have held, and still hold, that the amount of underground water and its circulation is much more general than he believes. This problem may be considered, first, from the point of view of the amount of underground water now present; and second, and more important, the amount of work which has been done by underground water.

Upon the first point, it is contended by Prof. Kemp that the amount of underground water in the belt of saturation is usually small; but in opposition to this view we have the general experience of mining men and of those who by wells seek underground water. While there are notable exceptions, it is in general a difficult and expensive process to lower artificially the level of groundwater which is generally found in both humid and arid regions, though at greater depth in the latter. In the lead and zinc districts of Missouri, this operation, called by the miners "beating the water," is usually attempted only by a number of companies, acting jointly, and constitutes the most formidable part of mining work.

In Wisconsin, it is a grave hindrance to mining below water level. The lowering of the groundwater by, say, 50 feet, is an exceedingly difficult task, involving enormous expense in pumping. The subsequent holding of the water at a given level is much easier, as Prof. Kemp has noted. But my conclusions from these facts are that, in the belt of saturation, the openings are large and the quantity of water is great, but the circulation is, in most cases, not too rapid to be controlled by pumps of moderate capacity—although, in some cases, to hold the water at a given level involves the handling of vast quantities of underground water.

In this connection Prof. Kemp remarks that the circulation at smaller depths than 1500 or 2000 feet has no bearing on the question of ore deposition. While a few ore deposits have been profitably worked to a greater depth than this, it is well known that probably not more than 90% of the metallic wealth of the earth yet mined has come from above the 2000-foot level; and therefore there is no warrant for the statement that the circulation above this level is not of vital importance in the production of ore deposits.

In this matter of depth, Prof. Kemp asserts of the general circulation of underground water, that "something like 2000 feet appears to be its limit;" but the only evidence which he presents upon this point is that in some cases this is the fact. The local instances cited are not proof of such a law. On the other hand, the evidence which I have presented to the contrary is reinforced by the arguments of Prof. Vogt, which, combining the facts of observed depth of denudation of veins with the likeness of their deeper parts to those parts nearer the surface plainly produced by underground waters, clearly lead to the conclusion that, in many cases, the underground circulation must have been efficient to a depth several times greater than 2000 feet.

On the second point, the work of underground water, Prof. Kemp declares that veins are the exceptional, not the general, work of this agency. He says that while veins occur locally in mining districts, there is a "general absence of veins." If Prof. Kemp means mineral veins, this is of course true; but if he means literally what he says (and it is only with this meaning that any argument can be made as to the circulation of underground water), I wholly dissent from the conclusion. In my field work throughout the United States and considerable areas of Canada I have yet to find a district in which a series of rocks has been in the belt of saturation for a long time geologically in which there are not extensive metasomatic changes in the rocks, and many veins.

While I have never advocated a universal, uniform, vigorous underground circulation, as implied by Prof. Kemp, I have held and still hold that, almost universally, in those places where ore deposits occur, a vigorous circulation was going on during the time the ores were deposited; and at the only places of which I know where ore deposits are now forming, such a circulation is going on. The fact that some areas in which ore deposits are now worked do not

now show a vigorous circulation has no bearing upon the question of the deposition of these ores by underground water. The very process of vigorous circulation by underground water results in the cementation of the openings, as I have fully explained. In so far as the innumerable openings are filled, and during the process here and there ore deposits are formed, just to that extent the openings are closed. When the openings have been filled to such an extent that they become subcapillary, circulation practically ceases for the time. But subsequent earth-movements or igneous intrusions may again produce openings in the rocks, and thus a new circulation may be set up. Of course it is well known that in the deep copper deposits of the Lake Superior region, and at various other localities, as at Przibram, there is not now a vigorous underground circulation. I cannot believe that Prof. Kemp therefore dissents from the conclusions of Pumpelly, Irving and others, that in the Lake Superior region the deposits of copper in the openings of the conglomerates and amygdaloids, extending to a depth of 5000 feet, or more, are the cementation result of circulating underground waters. Posepny realized full well that when the ore deposits were formed at Przibram, there was a vigorous circulation of underground waters at a depth below 1100 meters. With regard to the formation of the deep deposits of Lake Superior, Przibram, and many other localities in all parts of the world, cited by Posepny, in some of which there is now but a feeble circulation, I am but a follower of Sandberger and Posepny and nearly all the eminent geologists who have written upon ore deposits, in the belief that these ores were put in place by underground waters. In whatever respects I may differ from Sandberger or Posepny, there is absolute identity in our fundamental contention that the great majority of the metallic ores, to the greatest depth penetrated by man, were deposited in the places where they now exist by circulating underground waters.

The localization of ore deposits, of which Prof. Kemp speaks, I have shown to be due to the fact that each case of the formation of a deposit "requires the fortunate combination of many favorable factors working harmoniously together, the absence of any one of which may prevent the concentration of the ore deposit." Only here and there have existed the remarkable combination of circumstances necessary to form an ore deposit, and thus once in a million times, or once in ten million times, a vein formed carries a sufficient amount of the valuable metals to be an ore.

Therefore, notwithstanding the contrary belief of Prof. Kemp, I again assert that the deposition of the great majority of ore deposits—namely, those produced by underground water—is a special case of the general work of underground water, which can only be adequately explained by a profound knowledge of the facts and principles controlling the circulation and work of underground water, and a detailed knowledge of the special modifications necessary to explain the localization and relation of the ores.

### A Mine Tunnel Door Device.

TO THE EDITOR:—Your editorial of November 30, regarding the recent fire in the Smuggler mine, with its loss of twenty-four lives, and urging that means be employed to prevent similar accidents in other mines, suggests a simple and inexpensive device by which a draft into the tunnel can be automatically closed in case of fire at the portal. In tunnel work it often happens that the buildings at the mouth or portal are deserted, while all hands are inside at work; it is at such times that fires are most likely to occur, either from the forge or from a match carelessly dropped among the chips made in framing timbers; hence it is exceedingly desirable that the method employed to prevent smoke and gases from entering the tunnel be automatic.

Let a strong door be placed in the tunnel, not less than 50 feet from the mouth, closely fitted to the tunnel timbers, so as to shut off all draft when closed. To the inside face of the door attach a strong cord, running through a pulley, with a weight at the end sufficient to close the door and hold it tightly in place. To the outside face of the door also attach a cord or small hemp rope, running it through a small pulley so placed as to allow pulling the door wide open by means of the cord. Open the door and carry the line of rope out through the tunnel, around the sides of the blacksmith shop or other buildings, and back into the tunnel, passing the rope loosely through rings or pulleys placed a few feet apart to hold the rope in place. The end of the rope taken back into the tunnel can be fastened to the timbers, but pulled taut so as to hold the door open. In the event of a fire occurring at the mouth of the tunnel, the small hemp cord is sure to be burned very quickly at some point if it has been carried entirely around the inside walls of the buildings; and no matter where burned it releases the door, which is instantly closed by the weight, effectually closing all draft into the tunnel. The loop of the cord may be indefinitely extended through various rooms or parts of rooms provided it be without knots and suspended so as to run loosely through the rings when parted.

F. N. FLETCHER.

## The Gasoline Power Engine.

By E. W. ROBERTS, M. E.

I note in the November issue of *The Automobile* a request for a rule for calculating the power of gas engines. A very simple rule for the purpose, and one which the writer has tested many times, is expressed in the following equation:

$$H = \frac{D^2 \times L \times R}{18,000} \text{ for a four-cycle engine;}$$

Wherein D=the diameter of the cylinder in inches;  
L=the length of the stroke in inches;  
R=the revolutions per minute of the crankshaft;  
H=the delivered or brake horse power of the engine;

For a two-cycle engine the formula becomes:

$$H = \frac{D^2 \times L \times R}{13,500}$$

Stated in words the rule is as follows:

Multiply together the square of the cylinder diameter, the length of the stroke and the speed in revolutions per minute; and divide this product by 18,000 to obtain the horse power of a four-cycle engine, and by 13,500 to obtain the horse power of a two-cycle engine.

The equation has the same numerator for gas engines of all kinds, and working on any sort of fuel. The denominator will vary according to the conditions under which the engine is working and with the fuel. The denominators are, however, those which fit the average engine of its respective class working with gasoline as a fuel.

These formulas will give the horse power within 15% for engines ranging from 4 to 50 H. P. and working with the usual mean effective pressures of from sixty to seventy pounds per square inch. The writer was talking to a builder of gasoline automobile engines last summer and he was informed that his standard engine would give any result between 5 and 6 brake H. P. when tested, although the engines were, so far as could be seen, identical in every respect, proving that a rule to give exact results must be flexible indeed.

It is always a good plan to select an engine with an ample margin of power. A gasoline engine is peculiar in that it cannot be overloaded like a steam engine. If by any chance an excessive load is put upon it, the engine slows down and very soon stops. This is because there is no means of increasing the mean effective pressure in a gas engine cylinder after it has reached the point where it is working with a full charge.

One of the most deceptive things to the non-technical man is the manner in which the manufacturer uses the term horse power. Quite a few builders are listing their engines as giving so much indicated horse power. This is often taken to mean that the engine has that amount of effective horse power available for driving the vehicle. A gasoline engine may give 5 indicated H. P. and yet but 3 H. P. out of the five would be available for driving the automobile to which it was applied. While this ratio is an extreme and indicates a mechanical ratio of only 60%, such a low efficiency as this is occasionally found in small gasoline engines. This shows that the purchaser of a gasoline engine would do well to insist upon a guarantee of a certain brake horse power at a specified speed of the engine. He should not be even satisfied with a guarantee that the engine will give the specified horse power. An engine that will give 5 H. P. at 500 revolutions per minute will give very nearly if not quite 10 H. P. at 1000 revolutions per minute.

A point which is quite often lost sight of by the gas engine designer, and one which the purchaser would do well to remember, is that obstructed inlet or exhaust passages cause a falling off in power. The loss of power is more apparent with an obstructed inlet passage than with an obstructed exhaust passage when considering the ratio of power lost to the amount of the obstruction. These passages should be designed not only in proportion to the diameter of the cylinder, but to the speed of the engine as well. There is no particular objection to an oversized passage, and it is therefore the best plan to design these passages with reference to the maximum speed at which the engine is to run for any considerable length of time.

The rule that is generally observed by the most experienced designers is to limit the speed of the gases in the inlet passages to 100 feet per second and in the exhaust passages to 85 feet per second. It is assumed for convenience that the speed in the exhaust passages is produced by the action of the piston with the gas at atmospheric pressure. Virtually, however, the pressure at the moment of exhaust is from thirty to thirty-five pounds per square inch, and it is for this reason that the lower limit is taken for the speed of the exhaust gases.

As an example, to illustrate the application of the above rule, say, take the case of an engine with a 6-inch stroke running at a speed of 600 revolutions per minute. In a complete revolution the piston travels 1 foot, and it is therefore running at a speed of 600 feet per minute, or 10 feet per second. Therefore, in order that the speed of the gases in the inlet passages should not exceed 100 feet per second, the

\*Abstract of paper read before the American Institute of Mining Engineers, Mexican Meeting.

area of the passage should not be smaller than one-tenth that of the piston. Should the speed of the engine be increased to 1200 revolutions per minute the piston speed would be 20 feet per second and the area of the inlet should be not less than one-fifth that of the piston.

These ratios should be retained even in the valve itself whenever it is practicable to do so, and in valves operated by the suction of the piston they should be even larger. The lift of the valves, as indicated by the distance *L* in the cut should be at

least one-quarter the diameter of the valve in order that the opening may be equal to the full area of the valve.

It is unfortunate but too true that the points considered in this discussion are often overlooked by the average designer. They are brought out in time by hard experience, and the writer wishes to impress their importance upon the mind of the buyer, in order that he may judge intelligently upon these important features in construction and in rating.

#### Tests of California Fuel Oils.

By HOWARD STILLMAN.

The Southern Pacific R. R. Co. has used fuel oil in locomotive service for several years, and is extending its use in proportion to the supply of this class of fuel.

As compared with coal, the following results have been obtained in evaporative tests made with both fuels in locomotive service. The engines with which the tests were made were of the same size and make and in similar service:

| Service, Passenger.                                      | —Fuel—                                     |             |
|----------------------------------------------------------|--------------------------------------------|-------------|
|                                                          | Summerland & Los Angeles Petroleum. (bit.) | Comax Coal. |
| Miles run                                                | 224                                        | 224         |
| Mean number of cars in train                             | 3.71                                       | 3.71        |
| Weight of cars in train, tons                            | 113.01                                     | 110.40      |
| Actual running time, hours                               | 7.55                                       | 7.63        |
| Average steam pressure gauge, lbs.                       | 133                                        | 130         |
| Temperature of feed water, deg. F.                       | 660                                        | 660         |

| Evaporation from and at 212° F.                          | 10.96                                      | 7.41        |
| Pounds fuel to evaporate 1 lb. water from and at 212° F. | .09124                                     | .1349       |
| Equivalent of fuel for equal evap., lb.                  | 1.00                                       | 1.48        |
| Ditto, by measure                                        | *168.9                                     | †1          |
| Gallons water evap. per gallon oil                       | 8.75                                       | ...         |
| Miles run per ton                                        | 74.14                                      | 55.72       |
| Fuel burned per hour                                     | *100                                       | †537        |
| Total ton mileage                                        | 25,314                                     | 24,730      |
| Ton miles per gallon oil                                 | 33.53                                      | ...         |
| Ton miles per lb. fuel                                   | 4.191                                      | 3,074       |
| *Gallons. †Ton.                                          |                                            |             |

The above items are from record of fuel tests made with careful attention to weights and measures.

Proximate analyses of the Comax coal are as follows:

|                      | Per Cent. |
|----------------------|-----------|
| Moisture             | 1.90      |
| Volatile combustible | 27.08     |
| Fixed carbon         | 55.38     |
| Ash                  | 12.50     |
| Sulphur              | 3.14      |

Total.....100.00

The fuel oil used in the test was a California product from the locality named, and ranging in gravity close to 16° Baume, its flash point being about 240° F., fire point at 290° F. In practice it is taken at the weight of eight pounds per gallon.

The California oil varies somewhat in gravity, but the fuel oils obtained from the Kern, Los Angeles, Summerland, McKittrick and other fields are represented in the results above shown. They are all dark brown or black heavy asphalt oils, being more or less oxidized petroleum, very thick and viscid at temperatures below 60°, and can only be handled by use of steam-heating coils in the tank or around the pipes.

The grades of California petroleum are many, and should not all be confounded with the fuel oil referred to. There is a wide range in quality for refining purposes, but by the term fuel oil we mean that it is supposed to be of use for little else than fuel, and this article deals more particularly with such oils.

As to the relative cost of either coal or oil fuel, the relative values are based on the figures from the above test for equal calorific effect from and at 212° F.; that is to say, 168.9 gallons of oil equal one ton of coal, to which ratio local prices may be applied. As to the effect on flues, fire boxes, etc., there is rather more trouble with oil from leaky

flues, seams, etc., than with coal fuel. This is due, not to the fuel, but to more rapid temperature changes in the firebox during service, with its subsequent expansions and contractions.

This applies particularly to the use of oil fuel in locomotives, because the service is so irregular in shutting off steam, stopping, starting, etc.

We have used oil fuel in stationary service many years, and it was used as fuel for a long time on the ferry steamers on San Francisco Bay, with excellent results, but was abandoned on account of possibility from accident on crowded boats and the timidity of the public. I had occasion, as a part of my duty, to make occasional inspection of the oil-burning boilers of the steamers Solano, Oakland and Piedmont. I have never seen an instance of damage to firebox plates from use of oil fuel. Stationary boilers, being regularly fired, and not forced in evaporation as locomotive boilers are, do not suffer from the rapid expansions and contractions referred to.

#### Motor-Driven Machine Tools.

The accompanying illustrations represent Bullock motor applications to machine tools. They show the adaptability of electric driving for different classes of machine work. Fig. 1 is of a grindstone, the ma-

FIG. 1.

FIG. 3.

chine being made by the Brown & Sharpe Manufacturing Co., and now in operation at the League Island Navy Yard, near Philadelphia. Figs. 2 and 3 show large sized lathes in the works of the Fore River Engine Co. at Quincy, Mass. These lathes

were made by the Fitchburg Machine Co., and one of them is 110 feet long over all. Bullock motors are mounted on the head and tail stocks, the speed control being obtained by the Bullock multiple-voltage system, giving six speeds in either direction without the use of resistance in the field or armature circuits. The Fore River Engine Co. operates 120 motors of the Bullock Electric Manufacturing Co.'s make.

#### Notes on a Mining Trip in Idaho.

Written for the MINING AND SCIENTIFIC PRESS.

The writer spent the months of August and September traveling through southern and central Idaho, looking over the developed mineral resources of those sections of the State. Custer county, which is about the geographical center of Idaho, was visited by way of Ketchum, the nearest present railroad point. This place is the terminal of a branch road which leaves the main Oregon Short Line at Shoshone and runs north up Wood river about 80 miles. Ketchum is an old smelter town, considerable quantities of lead-silver ores having been smelted here in the '80's. An English company owns the smelters and are doing a little prospecting work.

At Ketchum I took a guide and a team and traveled northward up Wood river, crossing the Sawtooth range, the divide between the Salmon and Snake rivers at about 9000 feet elevation. Near the divide I passed through the deserted mining camp of Galena. This camp was built up on rich bunches of lead carbonates and silver ores. Between the Sawtooth range and Salmon river lies Stanley Basin, a sheep grazing and cattle range country. I saw numbers of hot sulphur springs here. Eighty miles north of Ketchum, and about a mile apart, lies the half abandoned towns of Bonanza and Chester. Chester once supported several thousand people; now it contains only a few hundred. Bonanza is even smaller. Bonanza lies at the foot of Mt. Peters, the main peak of the district.

Lying on the south side of Mt. Peters, 6 miles by trail and -16 by road from Bonanza, are six silver claims. These were opened in 1877 by an incline shaft about 500 feet deep and several tunnels, and \$330,000 value of ores were shipped to the Omaha smelters from here. The ore was rich in silver—about \$2 in silver to \$1 in gold. The vein strikes north and south and dips 55° to the east.

Careful sampling shows that the main ore shoot is but 30 feet long—a mere chimney. The surface of the claim is covered with boulders of blocky diabase, which completely hides all croppings and makes surface prospecting difficult. The main vein is in a contact between felsite porphyry and diabase. There are indications of the existence of other parallel veins on this mountain top. Indeed, some of my samples of the surface were very encouraging.

North of and adjoining this group, lie a group of claims now being developed by a Boston company. This company have spent considerable money developing their property and are building roads, a saw mill, bunk house, office and a 10-stamp mill. It is said they have a vein 3 feet to 6 feet wide, with three shoots from 30 feet to 50 feet long. The ore averages \$27. The reported price paid for these claims was \$100,000—\$5000 down.

The Chas. Dickens claim, lying between the towns, is interesting for the fact that it produced \$500,000 in gold from a surface pocket. It was then sold to an English company, who, after spending considerable, failed to find the continuation of the ore shoot. All workings are now closed.

Above the town of Custer, on Mt. Custer, is situated the famous General Custer mine. Between '80 and '87 the mine produced \$5,000,000 to \$6,000,000. The ore body of the mine was exposed by either a land or glacial slide, which carried away the hanging wall of the vein. The ore thus laid bare was simply quarried out and shipped by wire rope tram to the mill. No work has been done here since '91.

The Lucky Boy group, adjoining the Custer mine, is being worked now. This has produced about \$3,000,000. It is opened by an incline shaft 630 feet deep, with eight levels. The vein varies from 18 inches to 15 feet wide, averaging 6 feet to 7 feet. Three ore shoots exist 120 feet to 250 feet long, and are continuous from top to bottom. A normal fault with a 15-foot throw occurs between two of the shoots. The quartz is of the hard, white, glassy variety, showing occasionally ribboned struc-

First, passing through solution from a series of zinc anodes to a corresponding series of metallic cathodes, a current of electricity, next introducing into solution alkaline hydrate, next introducing into solution, so treated, a soluble alkali-metal sulphide, and finally separating from solution resulting zinc sulphide precipitate.

## MINING SUMMARY.

Specially compiled and reported for the  
MINING AND SCIENTIFIC PRESS.

### ARIZONA.

(Special Correspondence).—The proposed new railroad line, being projected from Phoenix to Benson, will go via Tempe, Mesa, crossing the Gila river not far from Florence, passing near the rich mineralized section around Copper Buttes, Ray and Kelvin, thence up the San Pedro via Mammoth to Benson, connecting at the latter place with the Arizona & South-eastern, which will soon be operating its through line from Benson to El Paso, via Bisbee, Douglas and Deming, with a branch from Douglas to the copper mines at Nacosaria, Mexico. The Phoenix-Benson line, now being surveyed, is supposed to be a Santa Fe project. It will open up a section of known mineral north and give a direct route to the El Paso smelters over a competing line. The Clifton-Lordsburg line will also connect with the Benson-El Paso line.  
Phoenix, Dec. 23.

### GILA COUNTY.

C. H. Cutting, manager of the Troy C. Co. and Supt. of the Manhattan C. Co. at Troy, states that work is being continued by about 100 men on both properties, with ore bodies opened in the Copper Queen mine of the Manhattan and on the Alice of the Troy. The Troy Co. has ordered two 40 H. P. boilers, a steam hoist to replace the gasoline hoist (which will be transferred to the Sisson shaft on the Manhattan), a compressor and machine drills, together with a pumping plant. The erection of a smelter will be considered early in the coming year. Surface improvements in the shape of roads, ultimately to become tramroads, connecting the Manhattan and Troy properties with the proposed smelter site, are being made.

### GRAHAM COUNTY.

The Shannon Copper Co.'s statement for the year ending October 31 shows that during the year the company paid \$1,003,850 for mines and \$240,074 85 for mine development and smelter construction. During the year 5129 lineal feet of development work was done. The mine is opened to a depth of 1100 feet by tunnels. At the present time the company propose to work the ores above the Boulder-Shannon level, which is 360 feet below the apex of the mountain. From the mouth of the tunnel the ore will be trammed 600 feet to the head of the incline, where it is dropped 1400 feet to the railroad and hauled 8 miles to the smelter on the San Francisco river at Clifton. Here the company owns two 250-ton water jacket furnaces, which are now being installed and will be put in operation shortly after January 1, 1902. Plans are being made for a 500-ton concentrator and a converter plant.

### MOHAVE COUNTY.

M. Redman, H. Lovin and H. L. Harris of Kingman claim that they have made a very rich discovery of gold ore in the Secret Pass country, in the Blue Ridge mountains. The vein, they say, is 20 feet wide and carries from \$10 to \$30 in values wherever opened.

### MARICOPA COUNTY.

(Special Correspondence).—The Lime Creek Copper Co., J. D. Marlar manager, has a 30-ton copper smelter at Alhambra, near Phoenix, which is to be started up the first of the year. They have also a 10-ton furnace at their mine, 15 miles east of Cave Creek, where considerable development work has been done. The ores consist of oxide, carbonate and sulphide of copper; a new shaft is being sunk to tap the ore 150 feet below present 300-foot level. A larger plant is contemplated.  
Phoenix, Dec. 19.

### PINAL COUNTY.

(Special Correspondence).—Parties in control of the Silver Queen mine, north-east of Florence, are sacking and shipping considerable of the copper ore on the dump left there when the property was worked mainly for silver. It is said much of it runs 25% copper.

The Arizona Copper Mountain Co. are developing a group of fifteen claims at Copper Buttes, 20 miles northeast of Florence, driving tunnels and shafts. A 300-foot tunnel crosscuts a vein of oxidized ore that is claimed to run 15% copper, with good values in gold and silver.  
Kelvin, Dec. 19.

### YAVAPAI COUNTY.

(Special Correspondence).—The Ardath, in Santo Domingo gulch, 9 miles east of Wickenburg, has a ledge running through a slate-porphry country rock, said to be 500 feet wide. Within the ledge are shoots and seams of lime-spar, carrying free gold. The property has a 5-stamp mill. An ef-

fort is being made to open the property and develop water.

Wickenburg, Dec. 19.

(Special Correspondence).—The Mountside M. Co. of Clinton, Iowa, are developing the property which they have acquired on Rich Hill, at Stanton. Their holdings cover a portion of this hill, and the ore bodies will be opened through a system of tunnels. Three of these have been started, the lower one proposing to cut 2200 feet below the apex of a well known vein, following the strike of the latter. George B. Upton, the company's manager, states that a gasoline power plant will be put in to generate electricity, the latter to run electric drills for the tunnel work. The ores here are a sulphide and steel galena, carrying gold. A 5-stamp mill on the property will soon start up.  
Stanton, Dec. 18.

### YUMA COUNTY.

(Special Correspondence).—The Valensuella Copper Co. of Denver, Colo., have bought and are developing a group of five claims in the Polomas range, in the Quartzite mining district, which is about 100 miles northerly from Yuma, 7 miles east of the Colorado river. The location is near the Valensuella wash, which drains into the Colorado river. The claims take in 7500 feet of a ledge which lies between a granite hanging wall and a lime foot wall. The ore body runs from 5 to 8 feet wide, the vein matter comprising copper oxides and carbonates, which are said to have sampled 24% copper and 34 in gold and silver at the surface, and 9% copper, 34 gold and 32 silver at 25 feet depth. The latter also assayed 12% iron and 15% lime.

Two incline shafts, 3000 feet apart, each following the dip of the vein, have been started. Between the two is a short crosscut tunnel which cuts into the ore body. The company expects to sink the two shafts to 200 feet depth and connect them by levels at the 100-foot and 200-foot stations.

The directors of this company are Richard Darling, F. W. Deidesheimer, G. C. Manley, C. W. Grassel and L. F. Bradshaw.

Quartzite, formerly Tyson's Wells, is a small supply point and is the name of the postoffice.

Quartzite, Dec. 20.

### CALIFORNIA.

#### CALAVERAS COUNTY.

A surveying party, under E. C. Moore of Santa Clara, chief engineer, have completed a survey for a ditch from the main fork of the Stanislaus river, near Schoettgen's range, via Murphys to Angels Camp. A. B. Thompson and G. Batten of Angels are the promoters of the enterprise. The ditch will be built to supply water for mining and electrical purposes. It will be 26 miles in length. The water will be taken across the Stanislaus river in a pipe line, 3000 feet down one hillside and up the other. It is estimated that 3,000,000 feet of lumber will be required for flumes, and the company intend to put up their own sawmill to provide it.

The people who have bonded the bed of the Calaveras river at Jenny Lind and the lands adjoining are beginning operations. Mr. Carnduff, representing them, has the prospecting plant on the ground and has begun work. The ground is to be prospected by numerous borings, which, if they develop the supposed value of the ground, will be followed by extensive dredging operations.

J. E. Doolittle, who has bonded the Cutler ranch at Jenny Lind, is also expecting to begin prospecting in a short time.

The Ilex mining property, in Rich Gulch district, owned by R. W. Petri, has been sold to J. O. Stewart, representing the Anglo-Saxon M. Co. The new company, it is understood, will commence development work at once.

The Sugar Pine mine, of the San Joaquin M. Co. of Stockton, near Angels Camp, J. McClay Supt., has been extensively developed during the last year and has had a mill installed preparatory to exploitation.

G. W. Huddleston and E. A. Angier, of New York, have been inspecting the work done on the Sultana mining property at Angels Camp, C. H. Morgan, manager.

B. R. Prince, who has been mining ground at Altaville, is under a bond to J. Hamby at \$30,000. He has organized the Altaville M. Co. with a capital of \$100,000 to operate it. A. Chalmers has been made president and manager; C. Demarest and J. Jones, of Altaville, F. J. Solinsky, of San Andreas, and H. E. Adams, of Stockton, are the officers.

Water has turned on the Maxey mine near El Dorado for the second season's run. The mine was opened last season and a short run made with excellent results. Two giants are in use. The gravel is deep, a 90-foot bank yielding gold from surface to bedrock. Last season a piece of

ground one-third of an acre in extent yielded \$5358.

### EL DORADO COUNTY.

At the Larkin mine, at Placerville, a 7-foot vein of ore has been struck on the 400-foot level on the west lode. Mr. Dunton, the Supt., says that the "rock is good milling ore," and that apparently there is plenty of it.

The Noon Day copper mine, near Diamond Springs, has been bonded by J. Q. Wrenn of Placerville and I. M. Proctor of Petaluma to the Payton Chemical Co. of Martinez, Contra Costa county, who, it is said, will at once begin active development and intend to sink 200 feet on it.

Oakland people, who have been engaged in developing the Pyramid mine, near Placerville, have bonded the Expansion mine, near the Pyramid, from B. Berns and C. McDonald, and have men at work cleaning out the ditch preparatory to the resumption of development work. A mill is to be installed at once.

At the South Slope gravel mine, near Placerville, the new hoisting machinery has been installed and the shaft is down 63 feet, with a station cut at 50 feet.

### FRESNO COUNTY.

The Fresno P. M. Co. of Fresno, A. E. Snow president and S. L. Hogue secretary, has eighty acres of placer ground on Sycamore creek, and has made preparations to hydraulic, expecting to start up Jan. 15.

### KERN COUNTY.

The Butte Lode Co., at Randsburg, has cleaned up about \$5500 from a crushing of sixty-nine tons of ore. Supt. McMahon says he is working from two shafts, about 800 feet apart, at about 150 feet depth.

G. W. Lloyd is building a new stamp mill on the Phoenix mine, at Johannesburg.

The Yellow Aster Co., at Randsburg, is running its mills to full capacity, stopping only half a day monthly. About 450 tons of ore are crushed daily and it is expected to increase the amount to 500 tons. The ore for the most part comes from the "Glory hole," a shaft on the side of Rand mountain, connecting below with the track level. All around this shaft ore is broken out and run down the shaft to the track level, thence to the mills on the tramway. The "Glory hole" is about 100 feet in diameter at the top—not all ore, but sufficiently so to make it cheaper to put it through the mill than to first sort it, throwing out the waste. During November Mr. Burcham, acting Supt., cut the Rand vein 300 feet below the surface, where it averages 6 feet wide of rich ore.

### MARIPOSA COUNTY.

An increased water flow has been struck at the Garibaldi mine at Kinsley, but so far it has been held by the skips and pumps, though said to be making something over 800,000 gallons per day. The stamp mill is almost completed, new cables have been put on the hoist, and Klondike sluices have been put in to wash the ore with the mine water before milling it.

### MONO COUNTY.

The cold weather and snow have shut off the supply of water for the mill at the Golden Gate mine, in Antelope valley, Donovan & Brown owners. The men have all been put to work getting out ore pending the starting up of the mill. The Almono M. Co., operating close to the Golden Gate mine, propose erecting a mill in the spring.

### NEVADA COUNTY.

D. B. Marwick, R. White and E. K. Smart of Grass Valley have taken an option on the State Ledge mine and several adjacent properties, and a water right of 300 inches near Grass Valley. The State Ledge mine has been worked for a number of years and has produced about \$350,000. The ledge will average 3 feet in thickness and the ore runs about \$7.50 per ton. The 10-stamp mill on the property, the hoisting works and pumps are all run by water power. The shaft is at present down 540 feet below the drain tunnel.

The Yuba mine at Maybert, which has paid well in past years, is being prospected and prepared for extensive working. A new 6-foot vein has been cut which shows well in free gold.

Supt. J. L. Bryson of the Gold Crown mine at Omega reports that while sinking the shaft a fine ore body was encountered. The rock is of high grade and the ledge of good size.

J. Tilton of San Francisco says that he expects soon after the commencement of the new year to make preparations for placing a 40-stamp mill on the Cleveland mine, near Nevada City, claiming that \$60,000 will be expended in machinery and development work. The ledge is a large one, and Mr. Tilton believes it needs a large mill, the ore being low grade.

### PLACER COUNTY.

The Azalea M. Co. at Dutch Flat has

struck good indications in the 110-foot upraise at the end of the 3400-foot tunnel. It is the intention of the company to extend the tunnel farther.

The Shady Run drift gravel mine, near Towles, is working about twenty men. W. H. Wilkins is Supt.

A. C. La Bud of Oak Bar, Siskiyou county, is completing arrangements to put his scoop dredger on the Zelma Bell river mine, 7 miles south of Colfax, on the North Fork of the American river.

### PLUMAS COUNTY.

A. E. Shinn, manager, states that his mining claim near Quincy is to be incorporated in January, 1902, as the Bluff City M. & D. Co. J. M. Shinn of Mount Vernon, N. J., has a large interest in the enterprise. Two tunnels are being driven on the ore vein, which is about 3 feet wide and runs from \$6 to \$16 to the ton.

### SACRAMENTO COUNTY.

The Gray Wing mine, near Folsom, continues to yield exceedingly rich pay dirt and the force of miners has been considerably increased. The new buildings in the vicinity of the mine give the appearance of quite a settlement.

### SHASTA COUNTY.

The Mount Shasta G. M. Co. is operating the Mount Shasta mine on Clear creek, near Shasta, and the McClure group of mines at Bully Hill. F. E. Ware is manager of both properties. The Mount Shasta, when last operated, shipped its ore by team to the smelters at Keswick for reduction. A mill and cyanide plant is now being installed on the property.

The Behrens & Leivsay mine on Clear creek, near Shasta, has opened up in a lower crosscut tunnel a shoot of high grade ore in a 3-foot ledge.

The Blue Bird mine of G. Vanderbilt and J. H. Bryant is having permanent development work done. The ore is a decomposed free milling gold quartz, assaying from \$15 to \$20 a ton.

A. Di Nola, owner of the Clipper mine on Squaw creek, near Kennett, has fifteen men employed at the mine running crosscuts and sinking a 200-foot shaft. C. C. Hartman is foreman in charge.

### SIERRA COUNTY.

Twelve men are employed at the Independence mine, on Wolf creek, near Downieville; C. M. Root is Supt. The old 8-stamp mill has been reconstructed and repaired and a test run of quartz is to be made. The property is owned by two estates and is being operated under a bond by a San Francisco company, represented by C. M. Root. The Independence ledge was worked many years ago, but has been idle for over twenty years.

The Hilo M. Co., owning the Chaparral Hill mine, near Downieville, it is reported, will soon start the mine up.

At the Ruby mine the owner, W. Wolf, has eighteen men taking out pay gravel. A nugget worth about \$75 has been found.

### SISKIYOU COUNTY.

At the Dewey mine, near Gazelle, owing to the altitude, the force has been reduced from forty to twenty men for the winter months. The Dewey, it is claimed, has been making monthly cleanups from \$1000 to \$9000.

J. Bourne, Jr., of Portland, Or., has been bonding and buying several claims at Callahans, and has altogether a large area of mining ground which he proposes to develop in the near future. Besides buying the Copper King and Copper King No. 2 from W. H. Parrish, together with the ditches and water rights, Mr. Bourne has bought from the C. P. R. E. Co. 800 acres in the same district.

F. LeMay, who has been prospecting in his claim at the head of Greenhorn, near Yreka, has pounded out about \$800 in six weeks with a hand mortar.

### TRINITY COUNTY.

At the Trinity G. P. M. Co., at the Nash deep gravel mine, near Carrville, W. Maitland Supt. and G. Hall foreman, a dam 30 feet high has been built in Coffee creek, making a storage reservoir for the hydraulic mining. A new pipe line taking water from Union creek to the mine has been put in, giving a pressure head of 365 feet. The pay gravel of the old channel has been found again by extending an old abandoned drift 100 feet farther into a highbar deposit.

### TUOLUMNE COUNTY.

The Horseshoe Bend G. M. Co. of Maine is operating a number of quartz claims on the Stanislaus, near Robinson. A gallow frame and hoist house are under construction.

The ten stamps in the mill at the Crystalline mines, near Rawhide, have commenced crushing ore and the mill is being run day and night. The gallow frame and hoist and new compressor building are under construction.

The Goldwin mine at Sonora, it is claimed, is showing good ore values in the drift south on the 500 level. The shaft is down 585 feet and sinking is progressing

at the rate of 1 1/2 feet daily. When the 600 is reached drifting north and south for the pay shoots found above will be started.

The Bourbon and Yankee Doodle quartz claims, on Knights creek, near Columbia, have been bonded by B. Signorotte and P. Capella to H. J. Sisty, and the latter has men at work developing.

The Peterson mine, at Columbia, has been bonded to R. Yuill and W. S. Murry of Victoria, B. C., who propose to begin work at once.

The App mine, at Quartz, is running, with forty stamps of the sixty being used. The shaft is being sunk from the 1000 to the 1200 level.

S. Donaldson has bought the Newcomer mine, near Columbia, and started it up.

At the Clio mine at Jacksonville work has been steadily prosecuted under A. Kleth, manager, and the working tunnel has been driven through to the ledge. This main tunnel is 490 feet long and 6x7 feet in the clear of timber sets. The tunnel, together with 50 feet of connections to old works, was driven in ninety-nine days, and in one week a record of 56 feet was made.

#### COLORADO.

##### BOULDER COUNTY.

At the Colorado Northern G. M. Co.'s tunnel at Wall Street preparations are being made to put in more machinery. A new lead has been found at 960 feet depth which is not yet fully developed. The entire length of the 7x6-foot tunnel is 2020 feet. The company has a second tunnel, some 700 feet in, about half a mile west of the main one. It is intended to make a junction of the two. The territory owned by the company approximates some seventy acres.

##### CLEAR CREEK COUNTY.

In Clear Creek county the special feature is tunnel mining. Between Idaho Springs and Silver Plume, a distance of 17 miles by railroad, there are 20 crosscut tunnels being driven, mostly from the level of South Clear Creek and the railroad into the adjacent mountains, so as to open up known mineral-bearing veins, formerly exploited by shafts. These tunnels will dispense with the cost of pumping, hoisting and wagon freight, and to some extent increase the net profit on the ore.

The following is a conservative estimate of the gross output of the mines of Clear Creek county for the year 1901:

|                        |                    |
|------------------------|--------------------|
| Georgetown .....       | \$ 200,000         |
| Silver Plume .....     | 320,000            |
| Empire .....           | 250,000            |
| Lawson .....           | 50,000             |
| Dumont .....           | 50,000             |
| Yankee and Alice ..... | 50,000             |
| Idaho Springs .....    | 2,000,000          |
| <b>Total .....</b>     | <b>\$2,920,000</b> |

Of the Idaho Springs figures \$1,600,000 is estimated as smelting ore and \$400,000 in mill ore. The records show lode locations for the year, 1122; mill sites, 80; tunnel sites, 45.

The Western Mines Dev. Co. has let a contract to F. Nelson of Georgetown to drive 250 feet on the new level started on the Anglo-Saxon Extension group. The conditions are to work two shifts and drive not less than 60 feet per month.

The S. & S. Co. has been incorporated to work mines on Red Elephant mountain near Lawson. The company is now driving a tunnel on the Tabor vein, which will cut under the mountain for over 1000 feet and drain a number of silver mines which are in a consolidation perfected by P. R. Stanhope. A plant of machinery, including power drills, has been put in.

The Gold Anchor mine, at Yankee, has been bonded to T. Slater, representing Chicago and Indiana people. The shaft is down 150 feet, the bottom showing 15 inches of \$200 ore. A heavy flow of water was encountered in the shaft, and a tunnel has been started and is in about 400 feet to drain it. As soon as new machinery en route is installed development work will be continued.

Berg & Co. are employed in cleaning up the Silver Glance, at Georgetown, which they recently unwatered through a crosscut tunnel driven several hundred feet. The old workings are in bad shape and it requires much labor to make them safe. On the fifth level a good-sized vein of mineral is now showing. This property was first abandoned fifteen or twenty years ago, but in 1890 C. E. Davis of Empire sunk a shaft and took out \$100,000. The ore is high grade and occurs in large bodies.

Preparations are being made for the resumption of work on the Mint, located on McClellan mountain, at Georgetown. H. W. Ross, representing Eastern parties, who are interested, and D. Kirby, who is to have charge of the work, have had buildings constructed and machinery and supplies hauled in.

W. E. Renshaw is taking out 1000 tons of ore per month from the vein in the

Newhouse tunnel, at Idaho Springs. Values are said to have improved, and it is expected to ship smelting ore. The stopes are carrying about 6 feet of mineral. In the surface working the lessees are taking out a fine grade of smelting ore.

##### EL PASO COUNTY.

The Recovery G. M. Co. has been incorporated by H. A. Watson, F. T. Sanders and O. H. Shoup at Colorado Springs. The capital is \$1,000,000, and the company will operate in Colorado and South Dakota.

##### FREMONT COUNTY.

The discovery of a large body of wolframite ore, running 72% in tungstic acid, is reported near Wilbur. The United States Steel Co. have bonded it and is now preparing to develop by an 800-foot tunnel to intersect the vein 600 feet below the outcrop on the summit of the mountain. Mr. Heaton, manager, is installing machinery.

##### GILPIN COUNTY.

The Mingo Co., near Central City, has reached the bottom of the shaft, which is down a little over 200 feet, and has let a contract to sink 100 feet deeper. Assays of the ore found in cleaning out the shafts and levels give ten to twenty ounces gold per ton. The property is in the lower part of the Lake district.

The shaft of the Plattsburg mine of the Cashier Mines No. 1, at Central City, has been retimbered a distance of 400 feet, and the company is preparing to sink 100 feet deeper. The dead work has shown up considerable ore. A shipment recently made gave \$175 per ton for the first class, the second class giving \$104. About forty-five men are employed.

At the California mine, at Central City, the Patch M. Co. is drifting in the 2100 and 2200-foot levels, said to be the deepest workings in the State of Colorado. At the Hidden Treasure mine, also operated by the Patch M. Co., a small force are at work in the 1600-foot level, taking out both milling and smelting ores.

R. Sykes, president of the Kansas-Burroughs Con. M. Co., reports that during November his company shipped from their properties on Quartz Hill, at Central City, 230 tramway cars or 2000 tons of ore to the Black Hawk custom stamp mills for treatment, besides smelting ore to Denver, the latter, however, being but a small proportion of the entire product.

##### GUNNISON COUNTY.

The Harris-Fairley C. M. & S. Co. of Aspen has been incorporated to do mining in the district surrounding Marble. F. Meyer is president, J. C. Ferris vice-president, and O. S. Moore secretary and treasurer, all of Aspen. The new company owns copper properties on Crystal mountain and will buy other mines, and contemplates the erection of its own smelting plant.

##### LAKE COUNTY.

A rich strike is reported on the Thompson lease from the Bohn M. Co. at Leadville. The Bohn Co. has a lease on all that part of the Starr placer which belongs to the St. Louis S. & R. Co. J. Newell is manager.

A new shaft is to go down on the Star of the West claim at Leadville. The shaft will be put down 500 feet to open up the lower contacts. G. H. F. Meyer is manager.

The Cloud City mine at Leadville has developed ore that will run from \$3 to \$3.25 on board cars. There is a considerable sized body of the ore and the assays show iron 15.8%, manganese 32.4%, silica 9%, and silver 1 oz. The ore was found in an upraise in the south drift, where a shell of hard flint was broken through into it.

##### MESA COUNTY.

The Unawep Copper M. & M. Co. of Lynn, Mass., G. H. Allen, president, and J. V. Howard, secretary, is building a quartz mill in Unawep canyon, 40 miles from Grand Junction. The mill is to have a capacity of 50 tons daily. W. C. McCurdy is manager and F. E. Blaisdell Supt.

##### OURAY COUNTY.

Work on the Black Cave property, near Ouray, is to be continued on a more extensive scale. J. Harkins is manager.

##### ROUTT COUNTY.

T. E. Kleckner, manager of the Hahn's Peak & Leadville M. & Inv. Co., operating at Columbine, says his company are about to install a new plant of machinery to cost \$10,000.

##### SAGUACHE COUNTY.

T. J. Downer and L. H. Jansen of Colorado Springs have bought the Hazard mine at Crestone. A large amount of development work has been done and three veins uncovered. Assays are high in gold, silver and lead.

##### SAN JUAN COUNTY.

The Kendrick-Gelder S. Co. of Denver has paid dividend No. 2, amounting to

\$10,000. The pyritic smelter, concentrator and mines of the company are located at Silverton. The ore bodies are very large. Improvements have been lately added to the smelter, so that in the spring the output is expected to be increased.

E. Johnson, J. R. Curry and A. Larsen, who own and are operating the Iron Magnet mine, near Silverton, are finding some of the same kind of ore that made that property famous in the early days. The middle tunnel is now in 800 feet, about 600 feet of which is on the 3-foot vein. Tests show the entire width of the vein to run about \$10 per ton, mostly in silver, and the sorted product brings \$60 per ton at the smelter.

The National Belle mine at Red Mountain, near Silverton, is being retimbered, cleaned up and put in working shape by a small force of men. The later production of crude ore from the mine has given returns of 65 per cent lead, and copper ores ran 22, 25 and 27 per cent to the ton. A large body of massive iron and copper and sulphides, containing gold and silver, has been struck.

##### SAN MIGUEL COUNTY.

The force employed in the Japan mine, at Telluride, has been increased and about 40 men will be employed during the winter, wholly in development work. The buildings and plant at the tunnel destroyed by fire a year ago have been replaced and a compressed air plant installed. The tunnel cuts the vein about 500 feet below the Japan shafts, draining the property.

##### TELLER COUNTY.

The following Cripple Creek companies pay December dividends to their stockholders, distributing the following amounts:

|                               |                  |
|-------------------------------|------------------|
| Stratton's Independence ..... | \$244,000        |
| Consolidated Co. ....         | 190,000          |
| Elkton .....                  | 100,000          |
| Last Dollar .....             | 30,000           |
| Gold Coin .....               | 30,000           |
| Strong .....                  | 25,000           |
| El Paso .....                 | 24,500           |
| Midge .....                   | 15,000           |
| New Zealand .....             | 7,650            |
| Modoc .....                   | 5,000            |
| <b>Total .....</b>            | <b>\$671,150</b> |

F. G. Whipp says he will resume operations in January on Mineral Hill, at Cripple Creek, on the property of the Sun Con. Co. In the past he has performed considerable work there endeavoring to locate the lead from which the placer gold of Mineral Hill has come.

The report of John Hays Hammond, consulting engineer of the Stratton's Independence, Limited, says of the property during the period from Nov. 23, 1900, to Sept. 30, 1901, that the total net dry tons of ore extracted were 66,199,685; gross value, \$2,506,862.46; freight and treatment, \$604,823.40; net value, \$1,902,039.06; revenue from royalties, etc., \$31,560.92; all expenses, \$866,599.74; profit, \$1,067,000.24; total cost of mine development, \$213,867.60. In his report of Nov. 23, 1900, he estimates the ore reserve at 120,000 tons of crude ore valued at \$19.16 a ton, and a total gross value of \$2,300,000, which would yield a net profit of \$1,000,000. This reserve has been materially increased by developments since. Because of the healthy condition of the property and in view of the development outlined, he recommends an increase of dividend rate to 20%.

The Des Moines G. M. Co. has leased on the north end of their Bob Tail claim to A. G. Ladue of Anaconda for three years, at royalties graded between 12 1/2% and 25%, according to the value of the ore shipped and for 50 shifts of work each month. Mr. Ladue will sink a shaft 200 feet on the claim, where he has been prospecting for some time.

The Glorieta M. & Leas. Co., operating the King and Whiting lease on the Hull City placer, at Cripple Creek, proposes to install a larger hoisting plant and put cages in the shaft, which is now down 1050 feet.

The Mint Con. M. Co., at Cripple Creek, states that from July 5, 1901, to Dec. 10th the Pointer Co. shipped 27,185 tons of ore, average value \$78.04 a ton, and the lessees 80,410 tons of dump ore, average value \$14.96 per ton, making total gross product of \$131,164.34. The Mint Co. shipped from the same ore shoot, from Aug. 19, 1901, 708 tons, average value \$46.01 per ton, total \$20,694.52, and a total for the two companies of \$151,858.86.

The New Bedford M. Co. of Boston, Mass., M. M. Thayer, manager, operating a tunnel on Cow mountain, at Cripple Creek, have cut ore at 700 feet which assays from \$17 to \$38 across 20 feet of width. The company owns 40 acres in this territory.

The annual meeting of the Acacia Co., Colorado Springs, elected J. E. Hundley, president; K. McKenzie, vice-president and general manager, and W. P. Sargeant, secretary and treasurer. Manager

McKenzie's annual report shows receipts from royalties amounting to \$29,565.73, from which \$5649.38 had to be deducted as operating expenses, leaving the cash balance of \$23,916.35 on November 29.

J. G. Berryhill of Des Moines, Iowa, has made a first payment on the Roxanna Co.'s property, adjoining the Doctor-Jack Pot, at Cripple Creek. The holdings comprise the North Star and Mountain Monarch claims, about eighteen acres. It is said that the price is close to \$300,000.

A lease and bond have been granted on the Colorado City claim of the Amazon Co. at Cripple Creek to Foster, Udick and associates for two years at a royalty of 20%.

Lyons and associates, composing the Muriel M. Co., operating on the dump of the Elkton mine at Cripple Creek, are sending twenty-five tons a day to market, the value of which is estimated to be in the neighborhood of \$25 per ton. The dump is estimated to contain 150,000 tons of rock, for which the lessees pay to the Elkton Co. \$1.50 a ton and agree to take away all the rock under a forfeit of \$5000. Mr. Lyons estimates that they will be able to extract 50,000 tons of pay rock.

#### IDAHO.

The Idaho Southern M. Co., limited, of New York, has been incorporated at Albany, N. Y., to mine in Idaho, capital \$100,000. Directors, A. M. Poole, W. T. Pendleton and E. Purcell of Albany, N. Y.

##### ADA COUNTY.

The Daisy M. Co. at Boise, which has been equipped with a 10-stamp mill and has been running for some time, is to be enlarged next season. G. W. Bredehoff, manager, says that with his present equipment he is treating from twenty-four to twenty-seven tons of ore daily, and from the plates averaging \$14.15 per ton, while concentrates bring an average of \$70.

##### BLAINE COUNTY.

The Wood River M. & D. Co. of Hailey has bonded the War Dance claim to H. P. Taylor of Hailey and E. B. Jones of Denver, Colo., representing a company organized by the latter. The price to be paid for the War Dance group is \$40,000.

Supt. Courtney of the Liberal mine at Hailey states that another rich body of ore has been found. The ore body in the Liberal was in contact with a porphyry dyke and a crosscut was made on the 150-foot level across this dyke and the new ore body run into at about 50 feet. The extent of the new find is not yet known.

The Grey Eagle, No. 1, owned by J. T. Mitchell, at Landore, reports a strike of a fine body of gold and copper ore which is said to be about 4 feet wide.

P. W. Johnson of Council has bonded some Salmon river mining properties and is making arrangements to do considerable development work during the coming season.

##### BOISE COUNTY.

The Checkmate mine at Pearl is to be transferred to Chicago people, represented by Governor Hunt, at a price understood to be \$150,000. By the terms of the arrangement \$50,000 is to be paid by March 1, 1902, when the property will be turned over to the new owners. The present owners of the Checkmate are E. E. Calvin, J. H. Young, J. D. Carnahan of Ogden, Utah, and several others. This property is said to have paid for itself and for all development from the start, and has returned handsome dividends.

The Friday mine, owned by J. C. Hill, bonded to B. F. Parish and operated by him for a few weeks, has been bought and finally transferred. At the bottom of the shaft a drift has been run 60 feet developing a large body of good grade ore. A large portion of the ore is shipping grade and the balance will be concentrated.

The complications that closed down the Friday mine at Pearl have been cleared and the property is to be started up in the spring with a milling plant. N. J. Sorensen, who was in charge of the mine at the time it closed down, has secured title to the entire property and will reopen it.

##### IDAHO COUNTY.

C. W. Colby and L. D. Harding of Lewiston have bonded the San Francisco group of claims in Buffalo Hump at \$25,000 for ninety days. Colby & Harding expect to proceed with development work in the spring.

S. E. Edwards of Boise says cinnabar is to be found in the Thunder Mountain country in quantity. A claim has been located by P. Smith. The ore specimens brought out, it is estimated, run 35% quicksilver. The entire ledge, he thinks, will run from 5% to 20% "quick." The vein is 10 to 15 feet in width, with no regular defined walls.

The Ella Hill G. M. Co. has been incorporated in Salt Lake City, Utah, capital \$25,000, with J. W. Burton, president, and E. A. Wilson, secretary and treasurer. The company owns the Ella Hill, Colum-

bia, Independence, Ajax and North Pole claims in the Neil mining district.

The Buffalo G. M. & M. Co. of Lewiston is making development of an extensive character, and on completion of the work now planned expects to be in shape for the installation of a mill.

The Montana-Idaho M. & Com. Co. has bought the Crooked creek placer mines and also the Dixie town site from E. B. Simmons and T. Bowlman at a price said to be about \$100,000. The new owners, Spokane, Wash., and New York men, plan improvements that will make a large placer enterprise.

#### KOOTENAI COUNTY.

H. Desgranges of Spokane, Wash., who is interested in Santa camp, says a rich strike has been made in the Iron Cap, in about 175 feet. The quartz is almost decomposed and carries coarse gold.

#### SHOSHONE COUNTY.

The owners of the Champion mine, at Mullan, have struck high-grade copper and gold ore in the lower tunnel.

The Powhatan M. Co. at Wallace has elected A. D. McKinlay president, W. Fishinger secretary and treasurer and M. Gaut manager. It is expected that work will be resumed early in January.

The Hercules mine at Wallace has shipped its eighth car of ore and it is understood that the eight cars will produce a net profit of \$20,000 above expenses. The ore is shipped to a smelter at Perth Amboy, N. J., and freight and smelter charges are \$36 per ton.

#### MONTANA.

##### JEFFERSON COUNTY.

The Colorado M. & Dev. Co. at Corbin claims that a 2-foot body of very fine ore has been struck in a drift now in about 50 feet. Manager Heilbronner says that a new boiler has just been added to the battery and that an additional 100 feet will be added to the shaft at once.

C. K. Gile has bought the interest of Haggerty Bros. of Butte in the Helper and Basin claims at Basin. Both claims are said to carry good values in gold.

##### LEWIS AND CLARKE COUNTY.

C. L. Fredericks, of the Columbian group of mines near York, has ordered a 50-ton cyanide plant to handle the tailings of the Columbian 10-stamp mill, which saves values from \$5 to \$6 per ton. The installation of the cyanide plant, it is estimated, will increase the average of the ore to about \$10 per ton. The mine is now being worked from the 300-foot level.

The report of the Montana M. Co., Limited, for the half year ending June 30, 1901, shows that 30 stamps of the 60-stamp mill were in operation during the entire half year and reduced 12,222 tons of ore from the mine. The yield in bullion was \$57,605, or an average of \$4.71 per ton. The expenditure on mining and milling, averaging \$4.42 per ton, amounted to \$54,122, the net realized profit being \$3,483. The expenditure for prospecting, operating shafts and general developments, amounted to \$47,404, the net result being a loss of \$43,921. From April 6 to June 30, 1901, a total of 31,710 tons of tailings was given cyanide treatment, realizing \$79,304, an average of \$2.50 per ton. The expenditure on tailings account amounted to \$37,410, or \$1.18 per ton, and the net profit was \$41,893, or an average of \$1.32 per ton.

##### MADISON COUNTY.

A. Lindfors, foreman of the Kennett mine, near Summit, states that the Kennett has been shut down for the winter, the pumps having been pulled. In the 600-foot level a 4-foot body of sulphide ore, carrying a high value in gold, has been struck. The Kennett 60-stamp mill, he says, will not treat the new body of ore, as the mill was built for free-milling ore.

##### SILVER BOW COUNTY.

The number of men employed in the different large mines in Silver Bow county, as reported by the State Mine Inspector, is as follows:

|                                 |       |
|---------------------------------|-------|
| Boston & Montana Co.            | 1,255 |
| Anaconda C. M. Co.              | 2,333 |
| Butte & Boston Co.              | 510   |
| Colusa-Parrot M. Co.            | 441   |
| Montana Ore Purchasing Co.      | 778   |
| Colorado Smelting & M. Co.      | 324   |
| Parrot S. & C. Co.              | 268   |
| Speculator M. Co.               | 229   |
| Washoe C. Co.                   | 143   |
| Farrell Shafts No. 1 and No. 2. | 39    |

Total.....6,320

Close estimates of the value of the base and precious metals produced by the Butte mines this year aggregate in value \$43,160,000. The output of some of the larger copper companies in pounds of copper is: Anaconda and Parrot companies, 125,000,000; Boston & Montana, ten months, 55,000,000; Montana Ore Purchasing Co., 25,000,000; Butte & Boston, 14,000,000; W. A. Clark Co., 20,000,000;

Colorado Co., 13,000,000. The gold and silver product is valued at about \$3,000,000. The St. Lawrence mine, one of the Anaconda properties, which has been closed down for several months, has been started up with a small force of men, which will be increased as soon as the ore can be handled by the new smelter.

#### NEVADA.

##### DOUGLAS COUNTY.

The Carson Valley S. & R. Co., it is reported, is soon to be incorporated with capital of \$100,000, with head office at Gardnerville.

##### ELKO COUNTY.

The Dexter M. Co.'s annual report on mines and mills at Tuscarora shows a production of gold bullion, gold dust and gold-bearing ores amounting to \$167,901, and expenses \$163,696.69. Supt. McKenzie in the report notes 35,000 tons of milling ore above the 250-foot level, and 53,000 tons of slimes, to which is being added thirty-five tons daily. A sampling of the slimes for November, 1901, showed an average value of \$11.20 per ton, while the average since June 1st last is \$8.25 per ton. With a plant adapted to the treatment of its slimes the superintendent says that 95% of the gold values and 75% of the silver can be recovered at a cost not exceeding \$1 per ton, and he recommends this equipment, which will be provided next spring. He also recommends the treatment of the tailings from the cyanide plants, of which there are 85,000 tons, of a valuation of \$3 per ton. E. H. Airis is president and G. E. Airis secretary, with offices at Salt Lake City, Utah.

##### HUMBOLDT COUNTY.

J. A. Williams of Salt Lake City, Utah, says the Morrison mine at Humboldt House has a vein from 10 to 12 feet wide, all carrying milling values in gold, silver and copper. He has bonded the Del Monte mine at Humboldt House. It is said to carry good values in silver, chlorides and bromides from a vein 8 inches to 2 feet wide.

Development work is being done on both properties.

##### LANDER COUNTY.

J. W. Fox and A. E. Hyde, of Salt Lake City, Utah, associated with Eastern people, have bought the Iron mine group near Eureka for \$55,000 from W. M. Bradley, J. Johnson and V. H. Pease. The property involved in the deal has been under development for some time, and, it is said, shows 10,000 tons of ore that will average \$21 per ton in gold. It is the intention of the buyers to begin at once the erection of a mill with which to treat the ores.

##### LINCOLN COUNTY.

The April Fool Co. of DeLamar has elected W. S. Godbe president and D. L. Wertheimer secretary. Experiments on new devices for more efficient treatment of the ores are being made, and the mill will be equipped and the leaching of ores proceeded with.

##### LYON COUNTY.

It is proposed to resurrect the old Carson River P. M. Co. and expend \$20,000 in new barges and dredging equipment by means of which the tailings from Comstock ores deposited along the Carson river bottom are to be recovered and treated by the cyanide process.

##### NYE COUNTY.

The ore production of Tonopah, it is stated, has blocked every smelter on the Pacific coast, each of them having several months' supply ahead. The Tonopah company has made arrangements with Capt. Davis, of the Black Point mill, at Dayton, to run his mill exclusively on Tonopah ores.

##### WASHOE COUNTY.

Work has been resumed upon the Bonanza mine, near Reno, by the owners, Stoddard, Boney, Gooding and Miller. The Bonanza is a quartz proposition carrying gold and silver, with a little copper and lead.

The first payment has been made on the purchase of the Blue Jay, Bald Eagle, Fan Tail, Harry R., Great Eastern, R. D. R. and Flying Dutchman copper claims on Granite Hill, near Reno. The new owners expect to do extensive development work in spring.

It is reported that a strike has been made in the Wheeler shaft at Wedekind. The ore, it is said, is to all appearances the same that was encountered in the Wedekind and Bell shafts, a couple of hundred feet away.

A bar of gold and silver bullion weighing thirty-six pounds was the result of a run of ten tons of ore from the Reno Star dump at Wedekind, an average of 2000 tons now on it. A ten-ton test by roasting process will be tried.

##### WHITE-PINE COUNTY.

A rich strike is reported as having been made by John Biale in one of his claims in

Newark mining district. The ore is said to carry silver and a high percentage of lead.

M. Martin of New York has organized a company, capital \$15,000,000, to develop his properties at Ely. The mine workings are in rich sulphide ores of copper, and deep mining, it is believed, will show bigger ore deposits.

#### OREGON.

##### BAKER COUNTY.

A strike has been reported at the Phoenix mine, in the Greenhorn district, near Baker City, consisting of a pocket of exceedingly rich ore. The Phoenix mine was recently bought by Parker & Crawford, of Chicago, Ill.

W. H. Washburn reports the completion of the new 25-stamp mill of the Hoosier Boy M. Co., at Prairie Diggings, which he says is now running on ore which comes from a ledge 200 feet wide, all of which is run through the mill. Mr. Washburn says that while some of the ore is high grade, the major portion is a low-grade proposition.

##### JACKSON COUNTY.

J. B. Scott & Co., who have been developing a quartz mine in Humboldt district, near Jacksonville, for several years past, have let a contract for running a 500-foot crosscut tunnel to S. T. Sandry.

A number of farms and mines on Missouri Flat, near Jacksonville, aggregating about 2000 acres, have been bonded to Chicago, Ill., and London people, who propose to bring water in from Applegate creek to mine the ground.

##### JOSEPHINE COUNTY.

The Victory M. Co. has sold its mine on Cow creek, near Grants Pass, to the Oregon Con. M. Co. for, it is reported, \$25,000. Interested in the new company are T. Carroll of Tacoma, Wash., W. J. Morphy of Chicago, Ill., G. A. Cole of Missouri and F. Eldomuller, D. Phelps, F. H. Miller and A. N. Mills of Oregon. The property includes the Victory hydraulic mine, with a 3½-mile ditch.

Three new quartz ledges have been discovered in Josephine county of late. One was in the Coyote Creek district, northern Josephine, where R. Huysink, a miner, has uncovered a 4-foot ledge that gives average assay values of \$18 per ton. Two other strikes have been made by W. E. Markham and C. W. Gerboth on Rogue river, 14 miles below Grants Pass. One ledge has a width of 4 feet, carrying average values of \$18 per ton, and the other a width of 1 foot, carrying an average value of \$20 per ton.

A rich ledge has been uncovered on Tip Top mountain, of the China creek district, near Grant's Pass. Mr. Jennings, of Grant's Pass, has opened a 12-foot ledge at a depth of 120 feet in an open cut on the mountain side. Samples of rock gathered from the strike, he claims, show \$96 per ton.

A sampling of ore from the Mammoth quartz ledge recently discovered in the Dry Diggings district, near Grant's Pass, by Pike & Perkins, shows, it is said, from \$2.44 to \$6.96 per ton, sulphurets and free gold. This gives an average assay value of \$4.74 per ton, of which \$2.38 is free gold. The ledge is claimed to be from 200 to 250 feet wide. The discoverers have a force of men at work developing.

The Osgood hydraulic mines at Waldo, developed by F. H. Osgood of Seattle, have begun operations for the winter, using three giants both night and day.

The Angel placer mines, situated in the Upper Galice Creek district, near Grant's Pass, have been sold by Jackson & Call to W. Gebhart, of Idaho, and J. H. Rogers, of Michigan. The property is in course of development.

At the Baby quartz mine, in the Louse Creek district, near Grant's Pass, the mill is said to be crushing rock that is averaging \$25 per ton in free gold and sulphurets.

A new hydraulic mine has just been started up on Louse creek, near Grant's Pass, by Jefferson Bros.

##### LANE COUNTY.

A rich strike has been made in the Lucky Boy mine, at Lucky Boy. It is reported that a 4-foot ledge has been uncovered for 500 feet that gives ore that assays several hundred dollars to the ton.

##### NEW MEXICO.

##### COLFAX COUNTY.

J. C. Scully of Elizabethtown has decided to build a dredger on the Moreno river. Mr. Reiling will also construct another dredger, and the building of an electric power plant is projected to furnish power to the three dredgers.

##### GRANT COUNTY.

The Mineral M. Co. has decided, it is reported, to erect a concentrating plant at Stein's Pass, to work on copper ore coming out of its mines at that place.

The Metallic C. Co. of Arizona has bought 100 acres of mineral land at Santa Rita.

#### LINCOLN COUNTY.

The stockholders of the Iowa & New Mexico M. & M. Co., of Nogal, are considering the putting of a hoisting plant on their Turkey Creek property, and a reduction plant at Schelerville.

#### SANTA FE COUNTY.

The Gibson Dev. Co. on its mining property at San Pedro, 88 feet down, has struck a blanket body of quartz cutting the formation, which carries well in gold.

#### SIERRA COUNTY.

The American Dev. & Construction Co. has been incorporated at Colorado Springs, Colo., capital \$400,000, with John Hays Hammond and F. Baker of London, H. A. Butters of San Francisco, Cal., H. S. May of Denver, I. W. Bonbright, L. E. Curtis and H. Hine of Colorado Springs as directors. The company will operate at Lake valley.

#### SOCORRO COUNTY.

The Abbey M. Co. has been incorporated and is operating in a new mining district 25 miles north of Magdalena, under N. Hall, manager. The company owns thirty copper-bearing mining claims. At the 100-foot level of a shaft on one of the claims a body of a good grade of copper ore has been struck. The shaft will be sunk to 600 feet. The company also owns a tract of bituminous coking coal land near to the copper mines. Machinery for the mines and reduction works are to be installed.

#### TAOS COUNTY.

I. T. Burns of Taos has started up work on the Gold King and Gold Queen mines, at Red River.

It is reported that the June Bug M. & M. Co. has sold its mill and mines at Red River.

I. W. Rolly has been given the contract to sink 100 feet on the Homestead property, near Red River.

#### SOUTH DAKOTA.

##### CUSTER COUNTY.

(Special Correspondence).—The Wabash M. Co., owning a group of claims 8 miles west of Custer, have completed their mine buildings, and have installed a large steam hoist and compressor plant. About ½ mile from the mine the company is building a 20-stamp mill and cyanide plant.

On the property there are seven veins, which have been opened at the surface within 200 feet of the main working shaft. They propose to cut these by drifts at each 100-foot level in the shaft. The officers of the company are Milwaukee, Wis., people. J. F. Sidey is manager, and Prof. E. Fink, consulting engineer and chemist.

At the North Star mine, near Custer City, ore is being taken from the 300-foot level. It is reported that the company will erect a mill in the spring. Supt. Lemmon has charge of the work.

The Black Hills Porcelain & Marble Co. is opening a marble quarry near Custer, and is opening a mine of lithograph stone. The company is shipping mica from two mica deposits, also in this district. The officers of the company are R. B. Noble, president, and C. E. Nason, Supt.

The Crown mica mine is being worked continuously. The new shaft is down 92 feet. F. C. N. Graydon is Supt.

The Clara Belle mine, at Oroville, is operating a small mill on ore that is claimed to maintain a yield of \$20 per ton, free milling. The tailings are being saved for future treatment by cyanide. Frank Hebert is Supt.

The Copper Butte M. Co., located 12 miles north from Custer, is preparing to prospect with a diamond drill to develop a large vein, which assays near the surface 7% copper and 4% tin. Harry Francis, Supt.

##### Custer, Dec. 12.

An electric drill has been installed at the Crown Mica mine at Custer, and a new shaft is being sunk. The mine is owned by the Chicago Mica Co., which claims to be increasing its product by a process of cementing together small pieces of mica, forming any sized block desired. The Crown mica mine, it is claimed, has produced blocks of mica that would cut sheets 24 inches square, which have sold from \$3 to \$10 per pound.

##### LAWRENCE COUNTY.

The Clover Leaf M. Co. has commenced sinking its main shaft deeper. A hoisting plant and pump have been installed. The company is operating the Uncle Sam mine, on Elk creek, at Perry. Many new houses are being built. The Clover Leaf Co. is principally owned by Wibaux, Mont., people. S. W. Russell, of Deadwood, is the manager.

Bullion is now being turned out again from the Golden Slipper mine, which was recently bought by the Empire State M. Co. A small mill is being operated, and it is stated that this mine has paid the cost of development work from the grass roots down. The company now operating it has blocked out sufficient ore to warrant

the erection of a 20-stamp mill, for which it is stated that negotiations are being made now.

Now that the North Star M. Co. has made a mine out of its proposition near Custer, negotiations are being made for the erection of a plant of some sort to treat the ore. It is stated that bids will be asked for about the first of the year for the construction of a stamp mill, concentrating and cyanide annex which will be installed immediately. Omaha people are interested almost entirely.

A 300-ton cyanide plant has been planned to be erected in the Ragged Top district by the Colorado-Dakota M. & M. Co. of Denver, work to be commenced early in the spring. It will be located at Ross springs.

Wasp No. 2 M. Co. of Deadwood, which started with a 50-ton cyanide plant, has since enlarged it to 100-ton daily capacity. The plant, it is stated, has already paid back several times over the original cost of the cyanide mill in dividends. J. Gray of Terryville is manager of the mine.

#### UTAH.

##### BEAVER COUNTY.

The Majestic Co.'s last shipment of five cars of ore from the O. K. claim at Milford sampled 41% copper, 4.3 ounces silver and 2.80 cents gold to the ton, with silica only 4.2%, against 24% iron. This ore was mostly taken from the 200-foot level.

The Bowie M. Co. has been incorporated in Salt Lake City, capital \$50,000. The officers are J. W. Solly president and treasurer and O. W. Moyle secretary. The company owns the Solly Nos. 1, 2 and 3 and Nabob and Nabob No. 2 in Beaver county.

##### JUAB COUNTY.

Connection between the workings of the Tetro M. Co. and those of the Godiva of Tintic has been effected on the 500-foot level of the Godiva. The ore into which the Tetro has come consists, says Supt. R. Brown of the Tetro, of galena and lead carbonate. The vein should extend through the entire width of the Tetro's territory, or 1200 feet, having struck into it from the Godiva.

##### SALT LAKE COUNTY.

At the Miner's Dream at Bingham, recently bought by the Bingham Con. M. Co. for \$35,000, a strike has been made 150 feet down of over 4 feet of red and black copper oxides, going 40% copper. This shoot occurs in a vein that is about 40 feet between walls and in an ore body that averages 6% copper, with some values in gold and silver.

A controlling interest in the stock of the Butte & Bingham Co.'s property, near Bingham, has been sold by Butte, Mont., people to Eastern men for \$30,000. The ore of the property carries copper, silver and gold; but the former metal predominates. It is understood that the new owners intend to prosecute extensive development work in the property.

#### WASHINGTON.

##### FERRY COUNTY.

R. E. Willoughby, Supt. of the Golden Reward mine at Bodie, has started work on the Bodie tunnel by contract. In February, he says, the directors will be at the mine and decide on future plans.

##### STEVENS' COUNTY.

The Valley Marble Co. has been incorporated at Spokane, capital stock \$150,000, by A. S. Crowder, F. C. Goodin, H. P. Palmer, M. Kulzer and W. W. Tighman. The company proposes to develop a marble quarry recently discovered near the town of Valley.

#### FOREIGN.

##### BRITISH COLUMBIA.

E. Kennedy & Co., for English people, have bought the Dubrovnik claim, near Rossland, from F. H. Pokorny, E. Tersick and S. J. Brailo.

The Slocan Star M. Co. has brought suit against the Byron N. White Co. over mining claims at Slocan. The latter company owns land which is crossed beneath the surface by a rich silver-bearing vein which outcrops above on the mining claim belonging to the Slocan Star Co. The point at issue is the extralateral rights from the apex ownership. This extralateral right was granted under the old mineral laws of British Columbia. Later laws and court rulings on the subject run otherwise. The plaintiffs have secured an order to examine the defendant's underground workings.

It is reported that preliminary surveys have been made by the Britannia C. Co. for a 600-ton concentrator at the Britannia mine on Howe sound, near Vancouver, and that work on the plant will begin in the spring. A tramway and wharfs will be built and the total improvements to be made will cost \$250,000.

A. C. Garde, manager of the Payne mine at Sandon, states that at the Payne

mine he is connecting the long tunnel at the 800-foot level with an upraise. Meanwhile the mine is shipping steadily. The experiment of installing electric drills at the mine has proved successful.

A report is made of a strike at the True Blue mine, J. C. Drewry of Rossland manager. The vein of high-grade copper ore that was 16 inches wide in the upper workings has been found in the intermediate tunnel 5½ feet wide.

A. Laidlaw, representing G. R. Thamer of Chicago, Ill., has bought from R. C. Graham the Queen of Sheba mine in Carmi camp, up the west fork of Kettle river.

#### MEXICO.

J. N. Walsh, Supt. of the Sonora M. & M. Co.'s mines at Tubutama, Sonora, states that a strike of a body of rich ore, running from 50 to 545 ounces per ton in silver, has been made in La Fortuna mine, owned by the company. A trial run of the ore by smelting, it is said, has turned out satisfactorily, and a fifty-ton smelter has been ordered.

The Grand Central mine and mill at Minas Prietas, after having been shut down for more than a year, has been started up and is expected to run steadily. G. Carey has been made mine foreman.

T. M. Yerkes of Santa Ana has sold to the Lozier M. Co. of Arizona the Cajon de Amarillas and Yaqui mines near Cieneguita, in the Altar district. Mr. Yerkes has done a great deal of development, sinking nine shafts, four of them more than 100 feet each in depth, and two exceeding 250 feet, all exposing large bodies of free-milling gold ore. In the bottom of the deepest shaft the ledge exceeds 11 feet in width. A 40-stamp mill will be erected, so it is stated, as soon as the necessary machinery can be assembled. H. A. Lozier of Cleveland, Ohio, is the president and principal stockholder of the company.

#### Personal.

JESSE GRANT is Supt. of a quartz mine at Yreka, Cal.

W. H. WILKINS is Supt. of the Shady Run Drift mine, near Towles, Cal.

T. L. ODDIE, of the Tonopah M. Co., at Tonopah, Nev., is in Philadelphia, Pa.

M. J. FLYNN is now Supt. Great Boulder Perseverance mine, Australia.

B. DELERY has been appointed Supt. of the Republican mine at Jacksonville, Cal.

H. BARNER has succeeded G. Abrams as foreman of the Dorleska mine, at Carrville, Cal.

M. MCILLWAIN has been appointed Supt. of the Dorleska mine, at Carrville, Cal.

A. J. McDONNELL succeeds Supt. Kyle in charge of the Sierra Nevada mine, Virginia, Nev.

R. H. CHANNING, Supt. of the Highland Boy mine at Bingham, Utah, is in New York.

H. FRANKLIN, manager of the Golden Reward M. Co., of Deadwood, S. D., is at Pittsburgh, Pa.

R. GEMMEL, Supt. of the Clement mines in Sonora, Mexico, is sojourning in Salt Lake City, Utah.

WM. DAVIES will have charge of the work on the Howe-Manhattan property, De Lamar, Idaho.

J. F. WARDNER has been appointed manager of the Keating copper mines, near Clifton, Ariz.

G. CAREY has been appointed foreman of the Grand Central mine at Minas Prietas, Sonora, Mexico.

W. H. GILMORE has been appointed Supt. of the Ketchikan M. Co., operating at Sea Level, Alaska.

JAS. ROSS, of Montreal, Canada, will be the future managing director of the Dominion Iron and Steel Co.

W. L. COBB, formerly assayer for Keystone Con. M. Co., has opened a custom assay office in Redding, Cal.

J. M. NOUGES JR., Supt. of the Josephine mine at Volcanville, Cal., is sojourning in San Francisco, Cal.

E. J. ROBERTS is reported to have succeeded Charles Sweney as manager Empire State-Idaho M. & Dev. Co.

W. H. HENDER has been appointed Supt. of the New York & Arizona C. M. & S. Co. mines, near Globe, Ariz.

J. T. MCCALL has returned to Michigan Bluff, Cal., from a two years' mining trip in the Philippines and Siberia.

CARL CLAUSEN, M. E., is the consulting mechanical engineer of the Greene Con. Copper Co., Cananea, Mexico.

T. E. KLECKNER, manager of the Hahn's Peak & Leadville M. & Inv. Co., at Columbine, Colo., is in New York.

THOS. N. SMITH, formerly of the Utica, Cal., mine, has returned to San Francisco from Urga, Touchetoukan, China, where

for the past eighteen months he had been in charge of the assay and gold purchase office of the Franco-Russian M. Co.

W. B. RYDER, late of Luning, Nev., has been appointed accountant at the Mount Shasta mine, near Shasta, Cal.

LOUIS AUERBACH, manager of the Trinity C. Co., is at the mine, near Kennett, in personal charge of operations.

H. A. SHIPMAN, Supt. of Stratton's Independence mine at Cripple Creek, Colo., is sojourning in Los Angeles, Cal.

W. S. McCORNICK, of Salt Lake City, Utah, has returned there from three years' mining in Siberia, in the Nertschinsk district.

R. HOLDEN, managing director of the Centennial Eureka M. Co. and United States M. Co., of Tintic, Utah, is sojourning in New York.

E. S. PORTER, of the U. S. Geological Survey, is in Lincoln county, Nev., making the Government statistical report on the mines of that district.

D. B. HUNTLEY, late manager of the DeLamar mine at DeLamar, Idaho, is in San Francisco for a few days, en route to Rhodesia, South Africa.

J. C. H. FERGUSON, Pacific coast agent Midvale Steel Co., has returned to San Francisco from Pennsylvania. After the 1st prox., his office will be at 220 Market St., San Francisco, Cal.

S. H. RIECHENBACH, managing director of the nickel mining corporation controlling the New Caledonia deposits of that metal, is in San Francisco, en route back to the island from Paris, France. He is accompanied by Major Robert G. Leckie, who is interested in the Sudbury, Ont., nickel mines.

#### Obituary.

CLARENCE KING, the most widely known geologist and mining engineer in the United States, died at Phoenix, Ariz., on December 22, of galloping consumption. For a number of years in the early '70s the deceased was connected with the U. S. Geological Survey. He did much of the early government work of the survey in the California mountains and on the 40th parallel. The story of his ascent of Mount Whitney, as he told it in "Mountaineering in the High Sierras," is one of the classics of California literature. It is more than a simple record of geology. So long as memory of the early years of California life—the years when the Gringo was making the land his own—so long as these memories remain, Clarence King's delightfully told story of Arcadian adventures will people the land of gold from the shades of the past. Clarence King's words will live to be the inspiration to high-aimed endeavor for many young geologists. The man himself, loved for a personality as charming as his writings, has gone forever, to the sincere sorrow and regret of a circle of friends as wide as his acquaintance among men.

#### New Patents.

DEWEY, STRONG & Co.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

|                                                        |
|--------------------------------------------------------|
| 688,821.—RAILROAD BRAKE—W. H. Bates, Dixie, Wash.      |
| 689,106.—MINING—J. E. Coleman, Spokane, Wash.          |
| 689,167.—MINING—J. E. Coleman, Spokane, Wash.          |
| 689,088.—SWIMMING DEVICE—B. J. Hooper, Portland, Or.   |
| 689,190.—PROCESS—B. Hunt, S. F.                        |
| 689,040.—PROCESS—L. W. Johnson, Jerome, Ariz.          |
| 688,879.—MIXER BOX—B. H. Otis, Perris, Cal.            |
| 689,028.—BRACE FOR BUGGY TOPS—A. Seekt, Pullman, Wash. |
| 689,328.—CARTRIDGE CAPPER—A. Seidell, Arcata, Cal.     |
| 689,338.—TAPPING BUNG—H. Wendt, S. F.                  |

#### Commercial Paragraphs.

THE W. J. Clark Co. of Salem, Ohio, report a lively demand for their improved hose couplers, known as the "Quick as Wink." Their use on com-

pressed air hose in shops where pneumatic tools are used is said to work a great saving of time. The W. B. Pollock Co. of Youngstown, Ohio, having tried them in their extensive boiler works, have decided to discard the common coupler and use the "Quick as Wink" instead. Their order has been placed for 180 sets.

#### Latest Market Reports.

SAN FRANCISCO, Dec. 26, 1901.

SILVER.—Per oz., Troy: London, 25½d (standard ounce, 925 fine); New York, bar silver, 55½c (1000 fine); San Francisco, 55½c; Mexican dollars, 47c San Francisco, 43½c New York.

COPPER.—New York: Lake, 1 to 3 casks, \$13.40; carload lots, \$13.00; Electrolytic, 1 to 3 casks, \$13.00; carload lots, \$12.87; Casting, 1 to 3 casks, \$12.60; carload lots, \$12.50. San Francisco: \$15.15. Mill copper plates, \$17.15; bars, 26¢/20c. London: £48 10s per ton.

LEAD.—New York, \$4.00; Salt Lake City, \$3.50; St. Louis, \$4.00; San Francisco \$4.50. carload lots; 4½c 1000 to 4000 lbs.; pipe 5½, sheet 6, bar 5½c; pig, \$4.75. London, £10 3s 9d per ton = 2.24 cents per lb.

SPELTER.—New York, \$4.20; St. Louis, \$3.75; London, £16 2s 6d per ton = 3.58¢ cts. per lb.; San Francisco, ton lots, 5c; 100-lb. lots, 5½c.

ANTIMONY.—New York, Cookson's, 10c; Hallett's, 9c; San Francisco, 1000-lb. lots, 10c; 300 to 500 lbs., 11c; 100-lb. lots, 13¢/15c.

IRON.—Pittsburg, Bessemer pig, \$16.50; gray forge, \$14.00; San Francisco, bar, 2.60c per lb., 2.65c in small quantities.

STEEL.—Bessemer billets, Pittsburg, \$24; open hearth billets, \$26.50; San Francisco, bar, 7c to 12c per lb.

NICKEL.—New York, 50¢/60c per lb. TIN.—New York, pig, \$27.50; San Francisco, ton lots, 27c; 1000 lbs., 27½c; 500 lbs., 27½c; 200 lbs., 27½c; less, 28c; bar tin, \$32½c.

PLATINUM.—San Francisco, crude, \$19 ½ oz.; New York, \$20.50 per Troy oz. BISMUTH.—New York, \$2.25 50-lb. lots; San Francisco, \$2.50 to \$2.75 lb. lots.

QUICKSILVER.—New York, \$51.00 large lots; London, £9 2s 6d; San Francisco, local, \$48.00 per flask of 70½ lbs.; Export, \$45.00.

MAGNESIUM.—New York, \$2.90 per lb.; San Francisco, \$3.75.

ZINC.—San Francisco, 5½c; slab, 5½c; bar, 7c; zinc dust, N. Y., 8c.

BABBITT METAL.—San Francisco, No. 1, 10c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 35c.

SOLDER.—Half-and-half, 100-lb. lots, 18c; San Francisco, Plumbers', 100-lb. lots, 15.25c.

PHOSPHORUS.—F. o. b. New York 50¢/60c per lb.

FERRO-MANGANESE.—Pittsburg, 80%, domestic, \$58.50, large lots.

TUNGSTEN.—New York, \$9, 95c; San Francisco, \$1.15.

FERRO-TUNGSTEN.—New York, 37%, 32c; San Francisco, 65c (60%).

ASSAY LITHARGE.—San Francisco, 10c per lb., small lots.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1\*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1\*\* 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2\* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2\*\* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9, in lots not less than 1000.

FUSE.—Triple tape, \$3.60 per 1000 feet; double tape, \$3.00; single tape, \$2.65; Hemp, \$2.10; Cement No. 2, \$3.00; Cement No. 1, \$2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 10c per set; 14 oz., 40s., 9c.

CHEMICALS.—Cyanide of potassium, 98%—99%, jobbing, 30¢/31c per lb.; carloads, 28¢/29c; in 10-lb. tins, 40c; sulphuric acid, in carboys, 66% B, 2c per lb.; soda ash, \$1.90 per 100 lbs.; hyposulphite of soda, 2½¢/3c per lb.; blue vitriol, 5½¢/6c per lb.; borax, concentrated, 7¢/8c per lb.; chlorate of potash, 12¢/13c; red sulphur, 6c; alum, \$1.90/2.00; flour sulphur, French, 2½¢/2c; California refined, 1½¢/2c; nitric acid, in carboys, 8c per lb.; caustic soda, in drums, 3¢/4c per lb.; Cal. s. soda, bbls., \$1.00; ska, 95c per 100 lbs.; chloride of lime, spot, \$2.50/2.60; nitrate of potash, in kegs, 8c; caustic potash, 10c in 40-lb. tins.

COAL.—San Francisco, coast, yard prices: Wellington, \$9; Seattle, \$7.00; Coos Bay, \$5.50; Southfield, \$9.00. Cargo lots, Eastern and foreign: Wallend, \$8.00; Brymbo, \$7.50; Pennsylvania, hd., \$14.00; Scotch, \$8; Cumberland, \$12; Cannel, \$9.50; Welsh Anthracite, \$12.00; Rock Springs, \$8.50; Colorado Anthracite, \$14.50. Coke, \$16 per ton in bulk; \$18 in sacks.

## ASSESSMENT NOTICES.

**INYO MARBLE COMPANY OF CALIFORNIA.**—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of November, 1901, an assessment (No. 35) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 31, tenth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.  
Office—Room 31, tenth floor, Mills Building, San Francisco, California.

**MARINA MARICANO GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of December, 1901, an assessment (No. 26) of four cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of January, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.  
Office—217 Sacramento street, San Francisco, California.

**BUDDLEY MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Bodie, Mono County, California.

Notice is hereby given, that, at a meeting of the Board of Directors, held on the 11th day of December, 1901, an assessment (No. 13) of two (2) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 60, No. 300 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 4th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD JR., Secretary.  
Office—Room 56 No. 3.9 Montgomery street, San Francisco, California.

**YUBA CONSOLIDATED GOLD MINING COMPANY.**—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that, at a meeting of the Board of Directors, held on the 17th day of December, 1901, an assessment (No. 5) of three cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 184, 9th floor, Crocker Building, corner of Post and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 17th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

EDWARD H. STEARNS, Secretary.  
Office—Room 184, Crocker Building, San Francisco, California.

**GARIBALDI MINING COMPANY.**—LOCATION OF principal place of business, San Francisco, California; location of works, Mariposa County, California.

Notice is hereby given, that, at a meeting of the Board of Directors, held on the 6th day of December, 1901, an assessment (No. 1) of one and one-half (1½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 18, 530 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 21st day of January, 1902, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 15th day of February, 1902, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. L. CHENEY, Secretary.  
Office—Room 18, 530 California street, San Francisco, California.

## AARON'S ASSAYING, PART I.

### FOURTH EDITION.

Revised, Rewritten, New, Improved.

This practical treatise on assaying has long been the favorite among practical men. The new edition is up to date. Price \$1, postpaid anywhere.

Book Dept., Mining and Scientific Press,  
330 MARKET ST., SAN FRANCISCO, CAL.

## ADAPTABLE TO THE ORE==THE AMERICAN STEAM STAMP

will run without close attendance after being easily set to deliver the blow best suited to the ore; very rapid heavy blows for tough hard ore, gentler treatment for slimy friable ore.

THE MILL FOR FRONTIER USAGE--THE AMERICAN STEAM STAMP

has the "steam hammer" valve and the "wedge base" adjustment for wear of shoes and dies. These work perfectly with unskilled handling. The American gives no trouble, is durable and unailing.

Though built for heavy and continuous service, it requires only small foundations, thus avoiding any great expense or labor in installation. We make the mills sectional for muleback when so ordered. We also make gravity stamps.

American Engineering Works,

Cable: "A M E W," Chicago.

CHICAGO, ILL., U. S. A.

# UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

Patented Dec. 5, 1899; May 29, 1900.

## THE DODD CONCENTRATING TABLE,

which we illustrate herewith, is the latest and most improved machine of this class now made.

This type of machine is so well known that little or no description is required. It is specially adapted for ores carrying a heavy percentage of sulphurets; has a large capacity and effects a clean separation.

The operating mechanism can be easily adjusted to meet the requirements of any character or condition of ore; it is simple, durable and efficient, and gives universal satisfaction.

For further particulars, address UNION IRON WORKS, San Francisco, Cal.

## "THE DANIEL BEST"

50 Horse Power

## TRACTION ENGINE.

~~~~~FREIGHT CARRYING CAPACITY OF WAGONS, 16 TONS EACH, OR A TOTAL CAPACITY OF TRAIN, 48 TONS.~~~~~

Capacity of Engine, 50 HORSE POWER.

Over One Hundred of these Powerful Engines in use on this Coast in the principal Logging and Lumbering Camps and for general freighting purposes. EVERY ONE A SUCCESS AND MONEY MAKERS.

These outfits are particularly adapted to haul freight of any description from out-of-the-way places, and will reduce the cost of transportation at least one-half and in many instances two-thirds. They can generally be worked where animal teams now do the work, and haul their immense loads of from thirty to fifty tons, ascending and descending grades as much as 5 per cent to 30 per cent, depending upon condition of the road; loads may be increased to even greater amount on a firm and moderately level road.

Send for Descriptive Circulars and Price List. Wagons are built which are best suited for the kind of freight to be handled. Estimates made for complete Steam Freighting Outfits. Address

EDSON OUTFIT.

CONSISTS OF

EDSON POWERFUL DIAPHRAGM FORCE PUMP, that will pump water containing Sand, Gravel, Tailings, Slime, or anything liquid enough to flow.
EDSON SPECIAL SUCTION AND CONDUCTING HOSE, that will withstand mineral action and climatic influences, besides the wear and tear of mining operations, and rough, mountainous journeys.
COUPLINGS, STRAINER and SPANNER, all complete, ready for immediate use.

CAPACITY, 1000 Gallons per hour to 8000 Gallons per hour. ONE-MAN and TWO-MAN POWER. (For full information by mail, Cable word "ZABARRO.")

Edson Manufacturing Co., 132-136 Commercial St., Boston, Mass., U. S. A.

MANUFACTURER OF

Mining Machinery

Above cut represents our 40 inch by 15 inch Special High Grade Crushing Rolls of which we built 36 sets for the new 5,000-Ton Concentrating Mill of the Anaconda Copper Mining Co.

These rolls are designed especially for heavy duty, they are very strong in every detail and provided particularly with very strong steel shafts and extra large bearings, the springs and tension rods are designed for the heavy pressure necessary to satisfactorily crush very hard ores.

The contract for these 36 sets of rolls was awarded to us in competition with most patterns in the market, after a thorough investigation by the experts of the Anaconda Copper Mining Co.

Our assortment of patterns for crushing rolls is very large, of all styles and standard sizes, for coarse and fine, wet and dry crushing. We have special patterns for sectional rolls to be carried on mules.

We furnish all shells for our rolls of Midvale "Perfected" Rolled Steel unless otherwise ordered.

THE GRIFFIN THREE ROLLER ORE MILL.

The Griffin Three Roller Ore Mill is a simply constructed Mill, suitable for working all kinds of ores that require uniformly fine crushing by the wet process. This Mill is a modification of the well-known Chilian Mill, but the rollers run upon a crushing ring or die, which is inclined inwardly at an angle of about 30 degrees, the rollers themselves also being inclined to the central shaft of the Mill, thus utilizing the centrifugal force, as well as the weight of the rollers themselves as a crushing agent. The Griffin Three Roller Ore Mill is therefore a Mill of great strength, and has few wearing parts. We construct these Mills with extreme care, using only the best of raw materials, which are most carefully worked by men who are specialists as mill builders. We sell the Griffin Ore Mill on its determined merits, and will gladly supply full information regarding it to any one.

W. & P. CYANIDE PAINT.

THE VERY HIGHEST GRADE OF PAINT OR COATING FOR
Cyanide and Chlorination Tanks and Vats,
FLOORS, SINKS AND TRAYS,

Or wherever acids, alkalis or water are used. Excellent also for REFRIGERATORS, being odorless when dry. It is a pure asphalt paint, and therefore unaffected by acids or alkalis. Dries very rapidly to an extent sufficient for handling or for application of second coat, but its full hardness is not attained for some hours, as drying is retarded by use of a heavy oil, and durability of coat is thus greatly increased. When dry is very tough and not brittle like most asphalt coatings. No carbon bisulphid, ether or other poisonous ingredients are used in its preparation, and as it gives out no noxious fumes or gases it can be used in perfect safety in confined places. For purposes given this paint is the equal of any other paint made, no matter if sold at double the price.

In Barrels, - - - 60 Cents per Gallon;
In Cases, - - - 65 Cents per Gallon.

Can be ordered through the trade. Insist on your dealer getting W. & P. CYANIDE PAINT for you or write us direct.

EXPERT TESTIMONY.

You need not rely wholly upon our word as to the superiority of Jeanesville Pumps.

We have letters in proof of our claims from engineers all over the world, the testimony of experts—men who understand mine pumping and practical mining machinery. Some of them are probably well known to you.

We will gladly send copies of their letters if you have any doubt of the merit of Jeanesville Pumps.

We claim that in Jeanesville Pumps is embodied the most practical combination of simplicity, accessibility, steam economy, capacity and durability. In a word, that they are the best obtainable.

ALL PURPOSES.

WHAT SUBSCRIBERS SAY.

The following is from a letter written on Dec. 7, 1901, by a leading Eastern metallurgist and mining engineer:

In your issue of Nov. 23, you have a very interesting note on Quartz Prospecting in California, with an illustration of a water wheel connected with hoisting gear. It seems that it might be adopted to advantage in many places, and if possible I should be glad to see something additional on the subject with a little more detail as to construction, water power, cost under average conditions, etc.

Such articles as these suggesting devices to those of us who can't cover the earth make the MINING AND SCIENTIFIC PRESS particularly valuable, and worth more to the practicing engineer who is not limited to the management of million-dollar properties, than any other paper.

WHAT ADVERTISERS SAY.

The following, dated Dec. 16, 1901, is from the assistant manager of the largest concern of the kind in the United States:

It is certainly gratifying to have unsolicited compliments for good work performed, and we can say that we have had more inquiries from States outside of California, brought forth by your publication, than from all other publications put together, which goes to show that you have a wide circulation and great number of subscribers who read your paper, because they find something therein to read. Everybody who sees it knows that you have the best publication of its kind in the United States.

Paint

If you require perfect insulation you had better use P & B Paint.

If it is important that metal or wood be protected against acids or acid fumes, or the elements, you must use P & B Paint.

When you have a brick wall or vault to make water tight, P & B Paint will do it for you.

Underground timbers can be made to last for many years by the proper use of P & B Paint.

P & B Paint is ready to apply—dries a brilliant black without odor.

CANTON
STEEL CO.

1609 Sixteenth St., Denver,
Colorado, contains much in-
formation which will prove
of interest. Mailed upon
application.

SCHAW, INGRAM, BATCHER & CO., Sacramento,
San Francisco.

Don't Take Chances

of finding out, after you have erected an expensive Mill, that the method designed won't treat your ore. OUR TECHNICAL DEPARTMENT is kept up solely for the purpose of testing all kinds of ores and tailings, and our record of results—showing in almost every instance achievements on the large scale such as we had predicted from our laboratory tests—should satisfy the most exacting inquirer. We make a Specialty of

CYANIDE WORK

and claim to have introduced the use of Cyanide to this Western country by the

MACARTHUR-FORREST PATENT METHODS.

Many of the large low-grade propositions in the West owe their success entirely to these processes; our experts, however, are constantly devising improvements, the latest being a method of overcoming the difficulties which have hitherto prevented the successful handling of ores containing copper and also a method for the profitable handling of silver ores by cyanide.

THE GOLD AND SILVER EXTRACTION CO. OF AMERICA, LTD.

TESTING WORKS, 1716 BLAKE ST.

208-210 MCPHEE BLDG., DENVER, COLO.

SMOOTH-ON

IRON CEMENTS

For repairing leaks or fractures in steam or hydraulic work—these cements are dry metallic compositions, which upon being mixed with water become a hard metallic iron, that is insoluble in steam, water, petroleum or other oils, that will withstand an intense heat, and the expansion and contraction being the same as iron is why they are sometimes called MAGIRON. When applied to a blemish in a casting by a skilled mechanic, the blemish is removed—unequaled for BOILER PATCHING. Send for our 60-page illustrated catalogue, free.

Sole proprietors and manufacturers: Smooth-On Mfg. Co., Jersey City, N. J., U. S. A.

Joshua Hendy Machine Works,

Nos. 38 to 44 Fremont St., San Francisco, Cal.

THE JEANESVILLE Miners' Sinking Pump

HAS THE FOLLOWING ADVANTAGES:

It is designed especially for the roughest and
most exacting service.

It is particularly adapted for gritty water.

It is very strongly and yet compactly built, so
as to occupy as small a space as possible.

It can be operated in any desired position,
either vertical or horizontal.

This pump is an improvement in many ways
over other makes of sinking pumps.

The cap under the Plunger is fastened with
Hinge Bolts, one bolt retaining the cap after the
rest are released. Also providing Priming Valves
in the Water Valve Chest Cover to prime the
Lower Valves from Column Pipe, and they are so
close as to be in no danger of breaking off.

We have thickened, and thereby strengthened,
the wall of water passage leading from lower end
of plunger. We have also strengthened the form,
without adding materially to the weight of the
connecting piece opposite the water passage.
These have been weak points in other sinkers.

All parts commonly made of brass, such as wa-
ter valve seats, valve stems, valve springs, etc.,
are made of Phosphor Bronze.

All parts are made to gauge, so that they can
be easily renewed.

Parts for repairs will interchange with
Cameron Sinkers of the same size.

MORAN FLEXIBLE JOINTS.

Simple. Efficient. Durable.

All Metal Construction.

Positively Tight Under Any Pressure.

Applicable to Steam, Air, Water, Oil.

STAMP MILL AND CONCENTRATOR IN OPERATION ON PREMISES.

Operator taking courses or horizontal
angles with BRUNTON'S PAT. POCKET
MINE TRANSIT.
If you wished to find the angle be-
tween two points below the horizontal
with a sighting compass or an ordinary
transit, you would first have to set up
your tripod or staff and then level up
your instrument. All this takes time.
If you only wanted to get the angle
within a degree or so, you could take
a BRUNTON TRANSIT, and holding it
in the position shown, take your
readings in less time than you can
place any other instrument. Send for
descriptive catalogue B 10.

No. 04 BUTTON BALANCE. Sensibility 1-100 milligramme.
If you are in the market for the very best balance obtainable at
a moderate price, write us for particulars about the No. 04. You
will be surprised to find how cheaply it can be purchased for
cash. While we cannot recommend this balance for fine gold
work, a great many assayers are using it for such successfully.
Send for illustrated catalogue A9, for complete description and
prices, to

Addressing Readers Personally.

Advertisers who avoid or neglect the use of the pronoun "You" overlook a colloquial element which is both easy and effective in operation. Whenever an advertisement is being read some individual is in front of it. Under these circumstances, why should not the advertiser's message be delivered as from man to man? Take the case of an advertiser who is employing space in a widely circulated weekly journal like the MINING AND SCIENTIFIC PRESS, and who is prepared to give his advertisement a few minutes' attention every week. Let such advertiser jot down from time to time the strongest arguments that he can think of why his goods should be purchased—such arguments, for example, as he or one of his travelers would use when addressing a prospective purchaser. Let him then imagine once every week that he has such prospective purchaser standing in front of him, and let him write down in a few terse sentences precisely what he would say to such a person, using the pronoun "You" in the colloquial style while doing so. There would be a freshness, an originality, and a vitality about a weekly talk of this kind, conducted through the columns of so well circulated a paper, which would quickly make its mark, and yield the advertiser who adopted the practice a satisfactory profit.

THE careful reading of current advertisements will convey a large amount of useful information on a variety of subjects.

Trade Paper Advertising.

It is very easy to go wrong in the matter of trade paper advertising. One temptation is to go into several without much reference to their circulation, stability, value, influence, or reliability, but there is hardly ever more than one paper in a trade that is first rate as an advertising medium. Since it is the leading paper in that trade, it is apt to reach nearly everybody of consequence in the business, whereas the circulation of the others, or of most of them, is likely to be largely a duplication. There are apt to be several very good reasons why that particular leading paper is the leading paper. It has the right kind of matter in it or it wouldn't be subscribed for so generally. It is usually on a firm foundation, and hence it conducts all of its affairs purely on a business basis. No fear, no favor; the same treatment for all, and that fair business treatment. All this, besides giving a publication the effective support of the trade—by means of which it is enabled to make money and to be independent—also gives the publication a character for reliability which helps the advertising as well as the reading matter—helps to make the advertising interesting, helps to make the reader think that the advertising is true. Another mistake that some make in reference to the trade paper is that they just put in a card—any old thing will do, you know—and let it go at that. The space that they buy is their own. Why shouldn't they make the best possible use of it, then? Why shouldn't they take pains with the preparation of their copy? Why shouldn't they change the matter often, perhaps in every issue? Why shouldn't they assume that the reader of the paper in question will follow the advertising pages generally, and their own advertising matter in particular, if there is live, fresh news in them?

PATENTS

OBTAINED IN ALL CIVILIZED COUNTRIES.

EXPENSE SAVED INVENTORS BY PRELIMINARY SEARCHES.

COMMUNICATIONS CONFIDENTIAL.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports since 1793, with full copies of U. S. Patents since 1872. As a result we are able to give reliable advice as to the patentability of an article, frequently saving the inventor the cost of an application. Our Washington branch tends exclusively to our business before the Patent Office. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the Mining and Scientific Press. We transact every branch of patent business, including filing of Caveats, Trade-Marks, Copyrights, Labels; prepare Assignments, Licenses and Agreements; give Opinions on Patentability and Infringements, etc. Circulars free on application.

THE DETROIT Sight Feed Lubricators

possess all the improvements and good features that have been suggested by our own and our customers' experience during the past twenty years.

They are being used by more than nine-tenths of the prominent American engine builders, who are good judges of lubricators. Many of these have used them continuously for more than fifteen years.

There are more than 550,000 Detroit Sight Feed Lubricators in use, or more than all other styles combined.

Use the Detroit Lubricators and you will be in good company. Our new catalogue, showing our full line, will be sent on application.

DETROIT LUBRICATOR CO., DETROIT, MICH.

Don't Experiment.

There's more good points that recommend the

U. S. Automatic Injector

to all who want a perfect Injector than any other.

Don't experiment. The best is what you want. Our "Little Engineers' Red Book" is a mint of useful information for every engineer. It's free for the asking. Write for it.

AMERICAN INJECTOR CO.,

The Putman Boots

Embody everything that is practical in Sportsmen's Footwear. For nearly a Quarter of a Century Putman Boots have been the standard among Western Hunters, Trappers, Prospectors, Ranchmen and Engineers (who demand the very best) and we have learned through our personal contact with them how to make a perfect boot. Putman Boots are water proof. Send for catalogue of over 20 different styles of boots. Also Indian Tanned Moose Hide Moccasins.

This cut shows our No. 678 Three Quarter Boot. (14 inches high) Bellows Tongue. Made on any style toe desired. Uppers are Special Chrome Tanned Calf Skin, tanned with the grain of the hide left on (our special tanning) making the leather **Water Proof**. Large eyelets and wide leather laces, also laced at side to fit the boot tight around the top. Furnished in Black, Brown or Straw Color. Sole, Light, Medium or Heavy. The sole is genuine Hand Sewed (making it soft and easy), and made of the best Water Proofed Oak Sole Leather. Made to your measure and delivered to any part of the U. S. for \$7.50. Send for order blank showing how to measure your foot.

The FRUE VANNER with Brownell "PATENT LIP" Flange Belt

stands for everything that is good, desirable and reliable in concentration. The FRUE VANNER is the STANDARD by which ALL OTHER concentrators are judged. If you buy some other concentrator you MAY get satisfactory results. If you buy a FRUE VANNER you are SURE to be satisfied. You get a durable machine of the highest capacity that gives a clean concentrate with the least possible loss in the tailings. The FRUE is furnished with the Brownell "PATENT LIP" FLANGE BELT. This is the best and highest priced

belt on the market. There are over 1700 of them now in use, and we have plenty of testimonials to show that after seven years' constant wear they are still without a break in the flange. All the largest Mining and Milling plants on the Pacific Coast, and in all parts of the world, have adopted them. Machines are made in four and six-foot widths, and furnished with either plain or corrugated belts. We supply either wood or iron carriage frame, as may be desired.
